2. A device of the character specified, comprising inlet and outlet chambers, a partition separating said chambers and having a valve-seat, a valve adapted to close toward the inlet-chamber against said seat, a spring forcing the valve yieldingly away from its seat, an externally-actuable screw-spindle movable independently of the valve and adapted to abut and force the valve to its seat against the tension of the spring, and a waste or vent outlet leading from the outlet-chamber and controlled by the movement of said spindle.

3. A device of the character specified, comprising inlet and outlet chambers, a partition separating said chambers and having a valve-seat,

a valve controlled to close against said seat upon the attainment of a predetermined pressure in the outlet-chamber, a waste or vent outlet leading from the outlet-chamber and terminating in a valve-seat opposite the said valve, and a screw-spindle passing through the wall of the outlet-chamber and movable independently of the valve, said spindle being adapted to abut the valve and move the same to its seat when screwed in one direction, and having a head or enlargement acting as a valve which closes against the said waste-outlet valve-seat when the spindle is moved in an opposite direction.

702,267. MACHINE FOR STRIPPING TOBACCO. CHARLES G. WELLS, Hartford, Conn. Filed Feb. 20, 1902. Serial No. 94,948. (No model.)

Claim.—1. The combination, with a device having a series of receptacles for the reception of articles, and also having a passage, of a punch or needle constructed to receive a cord, said punch serving to perforate, and insert the cord in, the articles.

2. The combination, with a bed having transverse recesses for the reception of the articles to be connected, and a longitudinal passage, of a perforating device constructed to receive and carry a cord through the articles.

3. The combination, with a bed having a series of separated recesses and a longitudinal passage, of a punch having an end shaped to receive a cord; and means for reciprocating said punch.

4. The combination, with a bed having a series of transverse passages and a longitudinal passage, of a punch having an end shaped to receive a string; and means for reciprocating said punch.

5. The combination, with a bed having a series of transverse passages and a longitudinal bore, of a punch having a barbed end to receive a cord; and means for reciprocating said punch.

6. The combination, with a bed having a series of transverse passages and a longitudinal bore, of a punch movable in said bore; ejecting devices; and means for actuating said ejecting devices.

7. The combination, with a bed having a series of transverse passages and a longitudinal bore, of a punch having a barbed point; means for actuating said punch; a series of ejectors; and means for actuating said ejectors.

8. The combination, with a bed having a series of transverse pas-

sages and a longitudinal bore, of a punch movable in said bore; a series of individual ejectors, one ejector for each passage; and means for actuating said ejectors.

9. The combination, with a bed having a series of transverse passages and a longitudinal bore into which said passages open; of a punch movable in said bore; and means for actuating the punch.

10. The combination, with a bed-plate, of a block mounted to said bed-plate, said block having a series of transverse passages and a longitudinal bore communicating with said passages; a punch having an end shaped for the attachment of a cord; and means for actuating the punch to cause it to perforate and carry the cord through articles placed in the passages of the block.

11. The combination, with a bed-plate, of a guide-block; a punch reciprocable in said guide-block and constructed to carry a cord; means for actuating the punch; and a bed having a series of transverse passages, and a longitudinal passage.

12. The combination, with a bed-plate of a guide-block; a punch having an end shaped to receive a cord movable in said guide-block; lower mechanism for actuating the punch; and a bed having a series of transverse passages and a longitudinal passage communicating with the transverse passages.

13. The combination, with a bed-plate, of a guide-block; a punch mounted in said guide-block; mechanism for actuating the punch; a bed having a series of separated, transverse passages and a longitudinal passage; a series of ejectors; and means for actuating said ejectors.

702,268. APPARATUS FOR APPLYING AND CONTROLLING BRAKING FORCE. HOWARD W. WHITCOMB, Reading, Pa., assignor to the Westinghouse Air Brake Company, Pittsburgh, Pa., a Corporation of Pennsylvania. Filed Nov. 14, 1900. Serial No. 461,987. (No model.)

Claim.—1. In an automatic fluid-pressure brake mechanism, the combination, with a train-pipe, an auxiliary reservoir, and two brake-cylinders, of a valve device controlling the supply of fluid to one of the cylinders, and which is opened automatically by changing the other cylinder with greater rapidity than during a service application of the brakes, substantially as set forth.

2. In a fluid-pressure automatic brake mechanism, the combination, with an auxiliary reservoir, a plurality of brake-cylinders, and a train-pipe which is normally charged with fluid under pressure, of a valve device controlling the supply of fluid to one of the cylinders, and which is opened automatically by effecting an unusually rapid reduction of pressure in the fluid under pressure in the train-pipe, substantially as set forth.

3. In an automatic fluid-pressure brake system, the combination,

with a train-pipe, an auxiliary reservoir, and a series of two or more brake-cylinders, of means whereby fluid under pressure is gradually admitted to one of the brake-cylinders for service applications of the brakes, and a valve device which automatically admits fluid under pressure to another brake-cylinder by effecting a more rapid flow to the first cylinder than is necessary for a service application of the brakes, whatever the degree of pressure in the train-pipe, substantially as set forth.

4. In an automatic fluid-pressure brake system, the combination, with a train-pipe, an auxiliary reservoir, and a plurality of brake-cylinders, of a triple valve for supplying fluid under pressure to one of the brake-cylinders in making service applications of the brakes, and a valve device, operated by the fluid which charges the brake-cylinder, for supplying fluid to another cylinder to apply the brakes with maximum force, substantially as set forth.

5. In a quick-action fluid-pressure railway-brake, and in combination with the parts or passages by which train-pipe pressure is vented directly from a train-pipe to a brake-cylinder, a valve in the line of such parts or passages, intermediate between the emergency-valve and the brake-cylinder, adapted to be opened only by the excessive pressure employed in a quick-action operation, and when opened, opening a part or passage which leads from another source of compressed air, substantially as set forth.

6. In a fluid-pressure brake apparatus an extra-service valve in a chamber on the delivery side of a source of supply, and in the line of the flow thereof, and suitable mechanism for varying the supply or charging pressure, in combination with air ports or passages leading thence to two brake-cylinders, one of which shall be open at low pressure, and both at high pressure.

7. In a fluid-pressure automatic brake mechanism, in which application of the brakes may be effected by varying the pressure in the train-pipe between certain limits above the pressure of the atmosphere, the combination with a train-pipe, an auxiliary reservoir, and a plurality of brake-cylinders, of means whereby fluid under pressure is admitted to one of the brake-cylinders on a moderate or gradual reduction of the train-pipe pressure, and a valve device which admits fluid under pressure to another brake-cylinder on a more rapid reduction of train-pipe pressure, substantially as set forth.

8. In an automatic fluid-pressure brake mechanism, the combination, with a train-pipe, an auxiliary reservoir, and a plurality of brake-cylinders, of valve mechanism, operated by a partial reduction of train-pipe pressure, for automatically supplying fluid-pressure to one or more of the brake-cylinders, according to the rapidity of the variations in train-pipe pressure between certain limits above the atmosphere, substantially as set forth.

9. In an automatic fluid-pressure brake system, the combination, with a train-pipe, an auxiliary reservoir, and a plurality of brake-cylinders, of means whereby fluid under pressure is admitted to one of the brake-cylinders on a moderate or gradual reduction of the train-pipe pressure, and a valve device which admits fluid under pressure to another brake-cylinder on a more rapid but partial reduction of train-pipe pressure, substantially as set forth.

10. In a fluid-pressure automatic brake mechanism the combination, with a train-pipe, an auxiliary reservoir, and a plurality of brake-cylinders, of means whereby fluid under pressure is admitted to one of the brake-cylinders on a moderate or gradual reduction of the train-pipe pressure, and a valve device which admits fluid under pressure to another brake-cylinder on a more rapid but partial reduction of train-pipe pressure, substantially as set forth.

11. In an automatic fluid-pressure brake mechanism, the combination, with a train-pipe, an auxiliary reservoir, and a plurality of brake-cylinders, of valve mechanism for automatically supplying fluid-pressure to one or more of the brake-cylinders according to the rapidity of the variations in train-pipe pressure, between certain limits above the pressure of the atmosphere, substantially as set forth.

12. In an automatic fluid-pressure brake system, the combination, with a train-pipe, an auxiliary reservoir, and a plurality of brake-cylinders, of a triple valve operated by gradual variations of train-pipe pressure to supply fluid under pressure to one of the brake-cylinders, and an extra-service valve which is brought into action by making a more rapid reduction of train-pipe pressure between certain limits above the atmospheric pressure, whereby fluid-pressure is applied simultaneously to more than one of the brake-cylinders under each car, substantially as set forth.

13. In an automatic fluid-pressure brake mechanism, the combination, with a train-pipe, an auxiliary reservoir, and two brake-cylinders, of means for admitting fluid under pressure to both cylinders by a partial release of fluid under pressure from the train-pipe, whereby the charging of one cylinder only may be effected by a moderate or gradual reduction of train-pipe pressure, and the charging of the other cylinder by a rapid reduction of train-pipe pressure, substantially as set forth.

Claim.—1. In an air-brake system, the combination with the triple and emergency valves, of a second brake-cylinder controlled by said emergency-valve, substantially as set forth.

2. In an air-brake system, the combination with the triple and emergency valves, of a second brake-cylinder and a piston therein operated by train-pipe air and controlled by said emergency-valve, substantially as set forth.

3. In an air-brake system, the combination with the triple and emergency valves, of a chamber interposed between them, a port therein closed by the emergency-valve and an emergency brake-cylinder connected to said chamber to receive train-pipe air through the emergency-valve, substantially as set forth.

4. In an air-brake system, the combination with the triple and emergency valves, of a chamber below the emergency-valve piston, a port therein controlled by said emergency-valve, the rod connecting said piston and emergency-valve passing through said chamber, and a supplementary air-operated brake-piston connected to said chamber, substantially as described.

5. In an air-brake system, the combination with an auxiliary reservoir and a triple valve, of a brake-cylinder arranged to receive air only from said reservoir through said valve, an emergency-valve and a supplementary brake-cylinder, arranged to receive train-pipe air through said emergency-valve only, substantially as described.

702,270. WEATHER-STRIP. BARNET M. WHITING, Spokane, Wash. Filed Mar. 10, 1902. Serial No. 97,476. (No model.)

Claim.—1. A weather-strip comprising a longitudinal panel provided with apertures and with a weatherproof edge, links pivoted upon said panel adjacent to said apertures, and means to be secured to a closure member and to project through said apertures so as to engage said links, said apertures being of proper conformity to allow said panel to rock with a parallel motion upon said closure member, and means for automatically actuating said panel when the door is opened and closed.

2. A weather-strip comprising a longitudinal panel provided with apertures and with a weatherproof edge, links pivoted upon said panel adjacent to said apertures, and means to be secured to a closure member and adapted to project through said apertures for the purpose of engaging said links, a head mounted upon one end of said panel for engaging the jamb of a door, thereby actuating said panel in one direction, and a spring for retracting said panel to its original position.

3. A weather-strip comprising a longitudinal panel provided with a weatherproof edge, and also provided with a head for engaging a jamb, means for supporting said panel upon a swinging closure member, links pivotally connecting said panel to said means, and a leaf-spring mounted upon said panel and engaging one of said links.

702,271. ELASTIC TIRE. WILLIAM F. WILLIAMS, London, England. Filed Apr. 12, 1902. Serial No. 103,701. (No model.)

ing by narrow ribs into the spaces having enlarged portions extending inwardly toward the core and reducing the cross-sectional area thereof so as to form a neck portion united with the tread portion of the tire, the sides of the core being convexly curved from the neck to the base.

2. An elastic tire of approximately D-section, provided near its base with a transversely-elongated bore, a band arranged in said bore and provided with abutments fitted to the edge portions thereof and corresponding to the shape of the bore, the ends of the abutments on the outer or tread face of the band meeting edge to edge to form a continuous bearing-surface, and an internal core integral with the tread portion and having a bearing-face at its base for engaging the said bearing-surface, the core being separated from the lateral walls of the tire by intervening spaces opening as narrow slots to the bore at or near the sides thereof, the said spaces having enlarged portions extending inwardly toward the core and reducing the cross-sectional area thereof so as to form a neck portion united with the tread portion of the tire.

702,272. COMMUTATOR SEGMENT. WILLIAM E. WHEELER, Philadelphia, Pa. Filed Apr. 21, 1902. Serial No. 104,022. (No model.)

Claim.—1. A commutator-segment consisting of a metallic bar having a projecting finger bent up therefrom at one end, substantially as specified.

2. A commutator-segment consisting of a metallic bar having a projecting finger bent up therefrom at one end, said finger being notched at the outer end for the reception of the armature-terminal, substantially as specified.

3. A commutator-segment consisting of a metallic bar having a projecting finger bent up therefrom at one end, said finger being twisted in the extent of a partial turn and having at its outer end a slot for the reception of the armature-terminal, substantially as specified.

702,273. CONVEYER-BELT APPARATUS. ALFRED M. AXELER, Pittsburgh, Pa. Filed Jan. 6, 1902. Serial No. 94,475. (No model.)

Claim.—1. In a support for a conveyor-belt, the combination of inclined standards having sockets or openings therein the lower ends of which are closed, shafts adapted to fit within said sockets or openings and be solely contained by the same, and pulleys, wheels or rollers fitting around said shafts.

2. In a support for a conveyor-belt, the combination of inclined standards having sockets or openings therein the lower ends of which are closed, shafts adapted to fit within said sockets or openings and be solely contained by the same, and pulleys, wheels or rollers secured to said shafts.

3. In a support for a conveyor-belt, the combination of inclined standards having sockets or openings therein the lower ends of which are closed, said standards being provided with slots communicating with said sockets

or openings, shafts adapted to fit within said sockets or openings, and pulleys, wheels or rollers secured to said shafts.

5. In a support for a conveyor-belt, the combination of inclined standards having sockets or openings therein the lower ends of which are closed, said standards provided with recesses on the outer ends thereof, shafts adapted to fit within said sockets or openings, and pulleys, wheels or rollers fitting around said shafts.

6. In a support for a conveyor-belt, the combination of inclined standards having sockets or openings therein the lower ends of which are closed, said standards provided with recesses on the outer ends thereof, shafts adapted to fit within said sockets or openings, and pulleys, wheels or rollers secured to said shafts.

7. In a support for a conveyor-belt, the combination of inclined standards having sockets or openings therein the lower ends of which are closed, said standards provided with slots communicating with said sockets or openings and leading into recesses on the outer ends of said standards, shafts adapted to fit within said sockets or openings and be solely contained by the same, and pulleys, wheels or rollers fitting around said shafts.

8. In a support for a conveyor-belt, the combination of inclined standards having sockets or openings therein the lower ends of which are closed, said standards provided with slots communicating with said sockets or openings and leading into recesses on the outer ends of said standards, shafts adapted to fit within said sockets or openings and be solely contained by the same, and pulleys, wheels or rollers secured to said shafts.

702,274. STOVE RANGE. DR. FRANK ARTHUR, Allegheny, Pa. Assignor to the J. C. Bartlett Company, Pittsburgh, Pa., a Corporation of Pennsylvania. Filed May 12, 1901. Serial No. 69,961. (No model.)

Claim.—1. A stove, range, &c., provided with a bottom having a sheet or single flue therein, an oven, a supporting-standard on said bottom under said oven and within said flue, and a movable flue-strip adapted to be raised and supported by and within said standard for permitting said flue to be cleaned.

2. A stove, range, &c., provided with a bottom and having a sheet or single flue therein, a movable oven, a supporting-standard on said bottom under said oven and within said flue, and a movable flue-strip adapted to be raised and supported by and within said standard for permitting said flue to be cleaned.

3. A stove, range, &c., provided with a bottom and having a sheet or single flue therein, a movable oven, a supporting-standard on said bottom under said oven and within said flue having a slot at one end thereof, and a movable flue-strip adapted to be raised and supported within said slot for permitting said flue to be cleaned.

4. A stove, range, &c., provided with a bottom and having a sheet or single flue therein, an oven, a supporting-standard on said bottom under said oven and within said flue having a slot at one end thereof, and a movable flue-strip supported by said slot and adapted to be locked therein in its raised position for permitting said flue to be cleaned.

5. A stove, range, &c., provided with a bottom and having a sheet or single flue therein, an oven, a supporting-standard on said bottom under said oven and within said flue having a slot at one end thereof, a movable flue-strip supported within said slot, and a plate on said strip adapted to engage with said slot in its raised position to hold the same and permit said flue to be cleaned.

6. A stove, range, &c., provided with a bottom and having a sheet or single flue therein, an oven, a supporting-standard on said bottom un-

702,275. DEVICE FOR ARRESTING RUNAWAYS. FREDERICK A. ARDRELL, Salt Lake City, Utah. Filed Sept. 20, 1901. Serial No. 73,722. (No model.)

Claim.—1. A runaway-arrester comprising a reel, a flexible member, a reel resistance device having normally separated members, and means actuated by said reel to bring said resistance members in operative engagement with the reel and to oppose the continued rotation of the latter with increasing force.

2. In a runaway-arrester, the combination with a reel, and a flexible member, of a reel resistance device having normally separated members, one of which is revolvable with the reel and the other member is arranged to oppose the rotation thereof, and means for bringing said members into cooperative relation on the withdrawal of a certain length of the flexible member.

3. In a runaway-arrester, the combination with a reel, and a flexible member, of a resistance member revolvable with said reel and slidable thereon, another resistance member adapted to be engaged by the slidable member, and means for bringing said resistance members into cooperative relation on the continued withdrawal of said flexible member.

4. In a runaway-arrester, the combination with a reel, and a flexible member, of a compressible resistance member, a slidable resistance member normally separated from said first-named resistance member, and means for bringing said slidable member into active engagement with said compressible member on the rotation of said reel.

5. In a runaway-arrester, the combination of a shaft having a threaded portion, a reel, a compressible resistance member within the reel, and a resistance-disk having threaded engagement with said shaft and slidable connection with the reel.

6. A runaway-arrester, comprising opposite posts at the sides of a street, a reel carried by one of the posts, a cable winding on the said reel and having fastening means at its free end to secure it to the other post, and a resistance in the reel and controlled by the rotation of the reel, to resist the unwinding of the cable after the same is stretched across the street from one post to another, the said resistance comprising a spring, a plate turned by and sliding in the reel and adapted to engage and compress the said spring, and a screw-rod on which the plate screws, as set forth.

7. A runaway-arrester, comprising a plurality of posts at the corners of intersecting streets, a reel on one of the posts, a cable winding in the reel and adapted to be fastened to either of the other posts, and a guide-roller on one of the posts and having its frame mounted to turn on the post, as set forth.

702,276. CLOSING AND LOCKING DEVICE FOR DENTAL FLASKS. DANIEL A. BAKER, Schenectady, N. Y. Filed July 21, 1901. Serial No. 70,266. (No model.)

Claim.—1. A closing and locking device, comprising a stirrup, a lever pivoted thereon, and a ball pivotally connected with said lever and movable in a guideway on the stirrup, as set forth.

2. A closing and locking device, comprising a stirrup, a lever fulcrumed thereon, and a ball pivotally connected with said lever and movable in a guideway on the stirrup, said ball having a bent middle portion, as set forth.

3. A closing and locking device, comprising a stirrup having guideways in its side arms, a U-shaped lever fulcrumed on the side arm of the stirrup, and a ball pivotally connected with said lever and mounted to slide in said guideways, as set forth.

4. A closing and locking device, comprising a stirrup having guideways in its side arms, a U-shaped lever fulcrumed on the side arm of the stirrup, and a ball pivotally connected with said lever and mounted to slide in said guideways, said ball having its middle portion bent downward, as set forth.

5. In a flask closing and locking device, the combination with a flask-receiving member, of a yieldable pressure member, and means for forcibly moving said pressure member.

6. In a flask closing and locking device, the combination with a flask-receiving member, of an elastic pressure member movable relative to the receiving member, and means for imparting relative movement to said members.

7. In a flask closing and locking device, the combination with a flask-receiving member, of a yieldable pressure-ball movable relative to said receiving member, and a lever for adjusting said ball.

702,277. GLASS-CUTTER. WILLIAM L. BARNETT, Bristol, Conn. Filed May 6, 1901. Serial No. 58,092. (No model.)

Claim.—1. A glass-cutter comprising a sheet-metal body portion folded along its longitudinal medial line to produce the parallel sides and having a biting-slot formed in said parallel sides, and a suitable cutter mounted in said body portion, substantially as described.

2. A glass-cutter comprising a sheet-metal body portion folded along its longitudinal medial line to produce the parallel sides, with a space between, and having biting-slots formed in said parallel sides, and a suitable cutter mounted in said body portion, substantially as described.

3. A glass-cutter comprising a sheet-metal body portion folded along its longitudinal medial line to produce the parallel sides and having at its rear and the struck-up ferrule or socket, and a suitable cutter mounted in said body portion, substantially as described.

4. A glass-cutter, comprising a body portion folded along its longitudinal medial line forming the parallel sides with a space between, and provided along its lower edges with the notches *d* and at its rear and with the legs *g*, said legs being struck up into conical shape and forming the ferrule for the reception of the handle, a handle fitted in said ferrule, and a suitable cutter mounted in said body portion, substantially as described.

702,278. BUTTON-CLEANING SHIELD. GEORGE H. BARNES, Chicago, Ill. Filed Jan. 25, 1902. Serial No. 51,152. (No model.)

Claim.—1. A button-cleaning shield, comprising a wire bent at about its middle to form a spring and two members, and shield-pieces secured to each of said members, said pieces being formed with recesses in their adjacent edges to receive the stem of the button when the members are pressed together, substantially as described.

2. A button-cleaning shield, comprising a wire bent at about its middle to form a spring and two members, and shield-pieces rotatably secured on each of said members and having in their adjacent edges recesses to receive the stem of the button, substantially as described.

3. A button-cleaning shield, comprising a wire bent at about its middle to form a spring and two members, and shield-pieces rotatably secured on each of said members and having in their adjacent edges recesses to receive the stem of the button, substantially as described.

die to form a spring and two members, and shield-pieces rotatably secured on each of said members and having in their adjacent edges recesses to receive the stem of the button, and an upturned flange at its outer edge, substantially as described.

702,279. GRAIN-SEPARATING MACHINE. WILLIAM L. BARNETT, Washington, D. C. Filed May 23, 1901. Serial No. 58,264. (No model.)

Claim.—1. In a thrashing machine and separator, a pneumatic stacker having its receiving-opening below the discharge end of the separator; a blower, a shaker interposed between the discharge end of the separator and the receiving-opening of the stacker, adapted to separate the chaff from the grain, and means for deflecting the separated chaff to the outside of the machine, substantially as shown and described.

2. In a thrashing and separating machine, a pneumatic stacker held to cooperate therewith; of a shaker held to receive from the discharge end of the separating device and located between the discharge end of the separating device and the entrance-opening of the pneumatic stacker, and devices for deflecting the chaff separated from the straw by the shaker, substantially as shown and for the purpose described.

702,280. POWER-TRANSMITTING MECHANISM. ALEXANDER T. BROWN, Syracuse, N. Y. Filed Nov. 14, 1901. Serial No. 52,002. (No model.)

Claim.—1. The combination of revolvable driven and driving members, a plurality of gears of unequal diameter, one being revolvable with the driven member and the others being capable of revolution relatively to the driven member, a plurality of planetary gears of unequal diameter revolvable with the driving member and cooperating with the former gears for transmitting motion from the driving member to the driven member, and means for preventing the rotation of said gears capable of revolution relatively to the driven member, substantially as and for the purpose described.

2. The combination of revolvable driven and driving members, a plurality of gears of unequal diameter, the gear of intermediate size being revolvable with the driven member and the small and large gears being capable of revolution relatively to the driven member, a plurality of planetary gears of unequal diameter revolvable with the driving member and cooperating with the former gears for transmitting motion from the driving member to the driven member and rotating said driven member at different speed than the driving member and in reverse direction, and means for preventing the rotation of said small and large gears, substantially as and for the purpose specified.

3. The combination of revolvable driven and driving members, a pair of gears of unequal diameter, one being revolvable with the driven member and the other being capable of revolution relatively to the driven member, a pair of planetary gears of unequal diameter revolvable with the driving member and cooperating with the former gears for transmitting

motion from the driving member to the driven member, and means for connecting to the driving member said gear capable of revolution relatively to the driven member and causing the same to rotate with the driving member, substantially as and for the purpose set forth.

4. The combination of revolvable driven and driving members, a pair of gears of unequal diameter, the large gear being revolvable with the driven member and the small gear being capable of revolution relatively to the driven member, a pair of planetary gears of unequal diameter revolvable with the driving member and cooperating with the former gears for rotating the driven member in the same direction as the driving member and at less speed, and means for connecting said small gear to the driving member and causing the same to rotate with the driving member, substantially as and for the purpose described.

5. The combination of revolvable driven and driving members, a pair of gears of unequal diameter, one being revolvable with the driven member and the other being capable of revolution relatively to the driven member, a pair of planetary gears of unequal diameter revolvable with the driving member and cooperating with the former gears for transmitting motion from the driving member to the driven member, means for preventing the rotation of said gear capable of revolution relatively to the driven member, and means for connecting to the driving member said gear capable of revolution relatively to the driven member and causing the same to rotate with the driving member, substantially as and for the purpose specified.

6. The combination of revolvable driven and driving members, a plurality of gears of unequal diameter, the gear of intermediate size being revolvable with the driven member and the small and large gears being capable of revolution relatively to the driven member, a plurality of gears of unequal diameter revolvable with the driving member and cooperating with the former gears for transmitting motion from the driving member to the driven member and rotating said driven member at different speed than the driving member and in reverse direction, means for preventing the rotation of said small and large gears, and means for connecting said small gear to the driving member and causing the same to rotate with the driving member, substantially as and for the purpose set forth.

7. The combination of revolvable driven and driving members having their axes substantially coincident, a plurality of spur-gears of unequal diameter, the spur-gear of intermediate size being revolvable with the driven member and the small and large spur-gears being capable of revolution relatively to the driven member, a plurality of spur-gears of unequal diameter fixed together and supported by the driving member concentrically to its axis, said latter spur-gears being revolvable with the driving member and cooperating with the former spur-gears for transmitting motion from the driving member to the driven member and rotating said driven member in one direction at different speeds and also in reverse direction, means for preventing the rotation of said small and large spur-gears, and means for connecting said small spur-gear to the driving member and causing the same to rotate with the driving member, substantially as and for the purpose described.

8. The combination of revolvable driven and driving members, the driving member being formed with an opening or chamber having peripheral and side walls, a pair of gears of unequal diameter, one being revolvable with the driven member and the other being capable of revolution relatively to the driven member, a pair of planetary gears of unequal diameter supported by the driving member in the opening or chamber thereof, said planetary gears being revolvable with the driving member and cooperating with the former gears for transmitting motion from the driving member to the driven member, and means for preventing the rotation of said gear capable of revolution relatively to the driven member, substantially as and for the purpose set forth.

9. The combination of a shaft, a driving member fixed to the shaft and provided with a hub, a driven member loosely mounted on the shaft and provided with a hub and a spur-gear fixed thereto, said hub being mounted, respectively, on the hubs of the driving and driven members and having their openings facing each other, one of said spur-gears being of less diameter than the first spur-gear and the other being of greater diameter than said first spur-gear, a plurality of spur-gears of unequal diameter fixed together and supported by the driving member concentrically in its axis, said latter spur-gears being meshed with the former spur-gears, means for preventing the rotation of either of the gears provided on the shaft, and means for connecting to the driving member one of the gears provided on said shaft, substantially as and for the purpose specified.

10. The combination of revolvable driven and driving members, a plurality of gears of unequal diameter, one being revolvable with the driven member and the other being capable of revolution relatively to the driven member, means for preventing the rotation of said gear capable of revolution relatively to the driven member, and a plurality of planetary gears of unequal diameter revolvable with the driving member and cooperating with the former gears and said means for connecting the gear revolvable with the driven member to the driving member and to the gear capable of revolution relatively to the driven member and thereby transmitting different rotary motions from the driving member to said gear revolvable with the driven member, substantially as described.

11. The combination of revolvable driven and driving members, a plurality of gears of unequal diameter, one being revolvable with the driven member and the others being capable of revolution relatively to the driven member, a plurality of planetary gears of unequal diameter revolvable with the driving member and cooperating with the former gears for transmitting motion from the driving member to the driven member, means for preventing the rotation of said gear capable of revolution relatively to the driven member, and means for connecting to the driving member one of said gear capable of revolution relatively to the driven member and causing the same to rotate with the driving member, substantially as described.

12. The combination of revolvable driven and driving members, a plurality of gears of unequal diameter, one being revolvable with the driven member and the others being capable of revolution relatively to the driven member, means for preventing the rotation of said gear capable of revolution relatively to the driven member, a plurality of planetary gears of unequal diameter revolvable with the driving member and cooperating with the former gears and said means for connecting the gear revolvable with the driven member to the driving member and to the gear capable of revolution relatively to the driven member and thereby transmitting different rotary motions from the driving member to said gear revolvable with the driven member, and means for connecting to the driving member one of said gear capable of revolution relatively to the driven member and causing the same to rotate with the driving member, substantially as described.

13. The combination of revolvable driven and driving members, the driving member being formed with an opening or chamber having peripheral and side walls, a plurality of gears of unequal diameter, one being revolvable with the driven member and the others being capable of revolution relatively to the driven member, a plurality of planetary gears of unequal diameter supported by the driving member in the opening or chamber thereof, said planetary gears being revolvable with the driving member and cooperating with the former gears for transmitting motion from the driving member to the driven member, and means for preventing the rotation of said gear capable of revolution relatively to the driven member, substantially as and for the purpose described.

702,281. SHUTTLE FOR LOOM. CHARLES H. BROWN, Boston, Mass. assignor to James C. Wilson, Chelsea, Mass. Original application filed June 10, 1901. Serial No. 52,002. Divided and this application filed Jan. 6, 1902. Serial No. 54,052. (No model.)

Claim.—A self-shuttling shuttle comprising a frame, a nose pivoted upon said shuttle, and means arranged to be engaged by warp-threads to change the plane of said nose, whereby the nose on said shuttle is auto-

nationally caused or made to occupy a predetermined plane with respect to a predetermined warp-thread.

702,282. DRILL-BIT GEAR. WILLIAM W. CAMPBELL, Petrolia, Pa. Filed Oct. 31, 1901. Serial No. 78,373. (No model.)

Claim.—A drill-bit and gear comprising two plates connected by bolts and spaced apart, said plates being provided with parallel registering recesses formed with serrated edges, a shank bolted to said plates and extending rearwardly and provided with brackets, a rod having a sliding movement in said brackets and provided with a fixed collar and with a roughened end, and a coil-spring about said rod confined between one of said brackets and the fixed collar thereon, and exerting its energy to force the inner end of said rod toward the serrated edges aforesaid, substantially as set forth.

702,283. EMBOSHING-MACHINE. ISAAC CLAPPER, Cumbury, Ohio. Filed Mar. 14, 1902. Serial No. 73,187. (No model.)

Claim.—1. An embosHING-machine comprising a mold, an embosHING-roller mounted to swing on one side of the mold, and an embosHING-roller mounted to swing on one end of the mold, substantially as specified.
2. An embosHING-machine comprising a mold, legs extended from the upper and lower ends of the mold, disks or plates mounted to swing on said legs, rollers on the inner surfaces of said disks or plates, an embosHING-roller

supported on said rollers, and an embosHING-roller mounted to swing on one end of the mold, substantially as specified.

3. An embosHING-machine comprising a die, a side embosHING-roller, plates mounted to swing on the die and supporting said roller, an end embosHING-roller, plates mounted to swing on the die and supporting said end embosHING-roller, means for securing adjacent disks or plates together, and link connections between the other disks or plates and the mold, substantially as specified.

4. An embosHING-machine comprising a die, one side wall and one end wall being narrower than the respective opposite walls, an angular continuation-piece for said narrower walls, and embosHING-rollers mounted to swing on the mold, substantially as specified.

702,284. PUMPER. MARTIN CODY, New York, N. Y. Filed Apr. 18, 1902. Serial No. 102,800. (No model.)

Claim.—1. A pumper in which a flexible tie is employed, comprising a rod, a fixed shooting device on the rod for engagement by a loop on the flexible tie, and a retainer removably held on the rod, a distance from the shooting device, and likewise adapted to be engaged by the said tie, as set forth.

2. A pumper in which a flexible tie is employed, comprising a rod, a fixed shooting device on the rod for engagement by a loop on the flexible tie, and a retainer removably held on the rod, a distance from the shooting device, and likewise adapted to be engaged by the said tie, the said removable retainer being in the form of a peg, engaging an aperture in the rod and extending from the rod in the same direction as the said shooting device, as set forth.

3. A pumper, comprising a flexible tie, a frame carrying a rod, a short leg projecting from the top of the said rod, a distance from one end of the frame, and a peg adapted to be inserted in an aperture on the said rod, a distance from the said leg, as set forth.

702,285. ADJUSTABLE WINDOW-CURTAIN SUPPORT. CHAS. F. H. COOK, Pequotash, Conn. Filed Jan. 11, 1901. Serial No. 68,005. (No model.)

Claim.—An adjustable window-curtain support consisting of frame, each frame having two cohes adapted to support shade-tips, and a curved arm adapted to support a drapey-hanger, rods projecting side-wise toward each other from the frame, a tube receiving the rods, blocks for supporting the tube, and end-covers turning in the blocks and clamping the rods, substantially as specified.

702,286. FOUNTAIN MARKING-BRUSH. JAMES A. GRADDALE, Brooklyn, N. Y., assignor to S. V. White, Brooklyn, N. Y. Filed Dec. 4, 1901. Serial No. 84,798. (No model.)

Claim.—In a marking-brush, the combination of a tubular reservoir open at its ends and internally threaded at each end and provided at its upper end with a lateral vent 12, a brush-head externally threaded and screwed into the lower end of the reservoir and provided with a central passage leading to the brush and flared upward and outward at its upper end, said brush-head being provided with an annular groove or notch 5 below its threaded portion to receive the lower end of the reservoir, said groove or notch forming an annular upwardly-extending flange 7 fitting and embracing the lower end of the reservoir, the external surface of this flange being rifled, a packing-ring in the annular groove, an externally-threaded cap screwed into the upper end of the reservoir and adapted to open and to close said vent 12, a valve-rod secured to this cap and carrying a tapered valve at its lower end adapted to seat in the flared passage of the brush-head, as set forth for the purpose set forth.

702,287. VEHICLE-BRAKE. WILLIAM A. CHITWELL, Vancouver, Canada. Filed Sept. 12, 1901. Serial No. 78,375. (No model.)

Claim.—1. In vehicles, the combination with the running-gear, including a brake-beam, levers fulcrumed on the brake-beam, brake-chains carried by the said levers and having vertical movement thereon, a draft device connected with the running-gear, slides carried by the draft de-

vices, guides for the said slides, ropes or chains connected with the said slides, pulley-guides for the ropes or chains, a connection between the ropes or chains and the inner ends of the said levers, bolts mounted on the brake-beam and adapted to be passed over the upper portion of the brake-chains, and means, substantially as described, for preventing the brake-chains from leaving the said levers, as set forth for the purpose specified.

2. In vehicles, the combination, with the running-gear thereof including the brake-beam and shafts, or a pole, of guide-plates attached to the under faces of the shafts, slides mounted to travel on the said guide-plates, friction-rollers carried by the said plates, ropes or chains attached to the rear ends of the slides and passed over the said friction-rollers and friction-rollers located on the running-gear, the rear ends of the slides being adapted for attachment to the holdback portion of a harness, levers fulcrumed upon the brake-beam and connected with the said ropes or chains, brake-chains having a curved lower rear face, a curved lower front face, and an opening at the forward portion, extending from top to bottom and conforming to the contour of the brake-chain at each point, the outer ends of the said levers being passed through the said opening, and bolts carried by the brake-beam and adapted to be passed over the upper ends of the brake-chains, for the purpose described.

702,288. PLUMB-BOB. WILLIAM M. CUBAY, California, Pa. Filed Dec. 21, 1901. Serial No. 85,943. (No model.)

Claim.—1. A plumb-bob consisting of a body comprising two longitudinal sections and provided with means at its upper and lower ends for connecting the said sections together, and a spring-actuated cord-winding drum mounted within the said body-sections, substantially as set forth.

2. A plumb-bob comprising a body portion formed of two longitudinal sections, the opposing faces of which are recessed, a spring-actuated drum located within the said recess, a perforated cap-piece connecting the upper ends of the body-sections, and a cord connected to the spring-actuated drum passing between the sections and through the perforation of the cap-piece, as described.

3. A plumb-bob comprising a body portion composed of two sections, the opposing faces of which are recessed, a spring-actuated drum located in the said recess, said body portions having threaded projections at their upper and lower ends, perforated cap or thimble secured upon the threaded projection at the upper end, the tip or point secured upon the threaded projection at the lower end, and a cord connected to the spring-actuated drum and passing through the perforation of cap or thimble, substantially as described.

4. A plumb-bob comprising a body portion composed of two sections, the opposing faces of which are recessed, a spring-actuated drum located in the said recess, perforated cap or thimble connecting the upper ends of the body-sections, the point or tip for connecting the lower ends of the said sections, a cord connected to the spring-actuated drum and passing upwardly through the perforated cap or thimble and a spring-actuated brake-lever arranged in one of the sections and adapted to bear against the side of the spring-actuated drum, substantially as set forth.

702,289. SHOE-POLISHER. BOWEN DE RAILL, Passaic, N. J. Filed Dec. 13, 1901. Serial No. 86,544. (No model.)

Claim.—1. A handle for shoe-polishing cloths, comprising elongated body portions formed of two relatively movable members, pins at the lower ends of said members, and means for holding the members with the pins in close proximity.

2. A handle for shoe-polishing cloths, comprising elongated body portions formed of two relatively movable members, pins at the lower ends of said members, and means for holding the members with the pins in close proximity, said means comprising a ring slidable on the parts of the handle-body portions.

3. A handle for shoe-polisher cloths, comprising a body portion formed of two arms movable toward and from each other, said arms having their lower ends formed with return-heads terminating in pins, and the pins lying parallel with and in close proximity to each other when the arms of the handle are moved together.

4. A handle for shoe-polisher cloths, comprising an elongated body portion with a handle proper at one end and means at its other end for removably connecting the cloth therewith, the said means comprising a transversely-elongated loop receiving the cloth and a spur carried by each end portion of the loop to impale the cloth.

702,290. SHOE-IRON HANDLE. CHARLES T. DENARE, New York, N. Y. Filed Feb. 11, 1902. Serial No. 93,081. (No model.)

Claim.—A shoe-iron handle having a bottom bar provided with an opening at about its center forming a bearing, a downwardly-inclined leg on its under face at one side of the bearing and having its point extending to within a short distance of the vertical plane of the wall of the bearing next to the leg, and an abutment on the under face of the said bar at the side of the opening opposite the said leg, and a gravity locking-bar sliding in the bearing of the bottom bar and provided with a handle at its upper end and with stop-lugs projecting from opposite edges of its lower end, said locking-bar standing when in its lowermost position with its lower end in close proximity to the point of the said leg, as set forth.

702,291. TONGUE-SUPPORT. SAMUEL BENNETT, Georgetown, Md., assignor to Mary Bennett, Georgetown, Md. Filed Apr. 5, 1902. Serial No. 191,457. (No model.)

Claim.—1. The combination with a hinged tongue, of a bolt slidably mounted in guides carried by said tongue, a spring mounted to yieldingly hold said bolt, a spring-arm connected to said bolt, guides carried by said spring-arm and embracing said tongue and a center-wheel carried

by said arm and located to run on the ground to support said tongue, substantially as described.

2. The combination with a hinged tongue, of a spring-arm connected to said tongue, a center-wheel carried by the free end of said arm, guides carried by said arm and embracing said tongue, an aperture cut in said guides, a pin slidably mounted in said aperture, a spring yieldingly holding said pin against longitudinal movement, a lever mounted on said pin, and pivoted to said pin, and means for operating said lever.

3. The combination with a hinged tongue, of a spring-arm connected to said tongue, a center-wheel carried by the free end of said arm, guides mounted on said arm and embracing said tongue, a cross-pin connecting said guides, an elbow-lever mounted in a standard supported by said tongue, one arm of said lever being connected to said cross-pin, and means for operating the other arm of said elbow-lever to incline said tongue, substantially as described.

4. The combination with a hinged tongue, of a spring-arm connected to said tongue, a center-wheel carried by the free end of said arm, guides carried by said arm and embracing said tongue, a lever mounted on said tongue and having one arm connected to said guides, a standard pivoted to said tongue, a lever fulcrumed on the body of the wagon and having one arm connected to said standard, and a connecting-rod connecting said standard and the other arm of said lever, substantially as described.

5. The combination with a hinged tongue, of guides embracing said tongue, means for yieldingly holding said guides against movement, a center-wheel carried by said guides and located to bear on the ground, a lever carried by said tongue and having one arm connected to said guides, and means for operating the other arm of said lever, substantially as described.

702,292. MOTOR PACKAGE-CARRIER. THOMAS H. BROWN, Washington, D. C. Filed Mar. 27, 1902. Serial No. 100,573. (No model.)

Claim.—1. A package-carrier for bicycles comprising a main stem or shaft having a longitudinally-adjustable clamping-jaw, and at its lower end an eye and fastening device, and at its upper end two arms and clamping-pots, provided with heads having sharp edges, longitudinally adjustable on said arms, substantially as described.

2. A package-carrier for bicycles comprising a shaft having at its lower end an eye and fastening device, and at its upper end two arms, a transverse clamping-jaw having means for adjusting it longitudinally on said shaft, extension-bars having clamping-pots at their outer ends and means for adjusting them longitudinally and securing them to said arms, substantially as described.

3. A package-carrier for bicycles comprising a shaft and two slotted arms, an adjustable clamping-jaw working in the slot of the shaft, and adjustable clamping-pots working in the slots of the arms, substantially as described.

4. In a package-carrier for bicycles, a frame composed of a shaft having means for securing it to a bicycle-frame, and two slotted arms in combination with a clamping-jaw secured to the shaft, and adjustable pots having screw-threaded ends in the slots of said arms and thumb-screws for engaging them with the shaft for the pots in place to engage with a package, substantially as described.

5. In a package-carrier for bicycles, the combination with a frame composed of a shaft and two slotted arms, of a clamping-jaw secured to the shaft and two adjustable extension-bars having clamping-pots, and screws provided with thumb-screws connecting said bars through the slots with said arms, substantially as described.

6. In a package-carrier, the combination with a frame composed of a shaft, having an eye and fastening device, and two outwardly-projecting arms having adjustable clamping-pots and transverse slots for receiving straps, of a clamping-jaw secured to the shaft and having strap-slots adjacent to its ends, substantially as described.

7. In a package-carrier, the combination with the shaft and slotted arms, of the clamping-pots, each composed of a screw, a sleeve and a thumb-screw for quick adjustment in the slots of said shaft and arms, substantially as described.

702,293. POCKET COIN-HOLDER OR BANK. BROWN & BROWN, Joliet, Ill., assignors to two-thirds to Thomas McPherson, John Turner, Eugene Belmont, and Richard Meyer, Peterson, N. Y. Filed June 20, 1901. Serial No. 90,570. (No model.)

Claim.—1. In a pocket-bank, the combination with a coin-holding case; of a follower-bottom movable longitudinally therein, and a sliding bolt within the follower-bottom for locking said follower-bottom at various points of adjustment lengthwise of the case.

2. In a pocket-bank, the combination with an elongated coin-holding case; of a follower-bottom movable lengthwise within the case, means within the follower-bottom for yieldingly supporting the same, and means for locking the follower-bottom in a fixed position.

3. In a pocket-bank, the combination with a coin-holding case; of a follower-bottom mounted therein and comprising a spring-supported coin-rest, and means connected therewith for adjusting and locking the follower-bottom.

4. In a pocket-bank, the combination with a coin-holding case; of a follower-bottom adjustably mounted therein and comprising a spring-supported coin-rest, a sliding bolt, and means for operating said bolt and throwing the same into and out of engagement with the case.

5. In a pocket-bank, the combination with a coin-holding case provided with a notch; of a follower-bottom adjustably mounted therein and comprising a spring-supported coin-rest, a spring-pressed bolt adapted to snap into engagement with one of said notches, and means for retracting the bolt and unlocking the follower-bottom.

6. In a pocket-bank, the combination with a coin-holding case; of a follower-bottom adjustably mounted therein and comprising a spring-supported coin-rest, a cam on said rest, and a locking-bolt adapted to engage the cam and having a projection or lug adapted to be operated upon by the case for retracting the bolt.

7. In a pocket-bank, the combination with a coin-holding case; of a follower-bottom movable longitudinally therein, a locking-bolt mounted between bolt-guiding plates, a yielding coin-rest, an expansive spring interposed between the coin-rest and bolt-guiding plates, a cam carried by the coin-rest and adapted to operate upon the bolt for retracting the latter, and means connected with the follower-bottom for operating the cam.

8. In a pocket-bank, the combination with a coin-holding case; of a follower-bottom movable longitudinally therein and comprising a sliding bolt mounted between bolt-guiding plates, a yielding coin-rest provided with a cam for operating the bolt, an expansive spring interposed between the coin-rest and one of the bolt-guiding plates, and means for operating the case consisting of a spindle having a sliding engagement with the cam.

9. In a pocket-bank, the combination with a coin-holding case; of a follower-bottom movable longitudinally therein, means for locking the bottom in any of its adjusted positions, bolt-guiding means comprising a spindle provided with a notch in one end, and an operating device consisting of a blade detachably mounted upon the exterior of the case and having the end thereof shaped to engage the notch of the spindle.

10. In a pocket-bank, the combination with a coin-holding case; of a reversible sleeve removably fitted upon one end thereof, means for locking the sleeve on the end of the case, a blade connected rigidly with said sleeve and reversible therewith, and a guard arranged exteriorly of the case and extending along one edge of the blade when closed.

11. In a pocket-bank, the combination with a coin-holding case; of a reversible sleeve detachably mounted on one end of the case, means for locking said sleeve thereon, a blade rigidly connected with the sleeve and adapted to extend lengthwise of the case, and a cap at the opposite end of the sleeve provided with a guard for covering the extremity of the blade.

12. In a pocket-bank, the combination with a coin-holding case provided adjacent to one end with a laterally-projecting rib; of a reversible sleeve mounted upon the end of the case and provided with a groove to receive said rib, means for fastening the sleeve on the end of the case, and a blade rigidly connected with said sleeve and adapted to extend lengthwise upon the outside of the case.

702,294. EXTRACTOR FOR PLUG-TOBACCO. DR. ALEXANDER J. FLEMING, Raleigh, N. C. Filed Feb. 21, 1902. Serial No. 90,082. (No model.)

Claim.—1. An extractor for plug-tobacco, designed to be applied to each plug and pushed therewith, consisting of a thin strip of flexible material bent to form inner and outer folds or members, which extend over the inner and outer sides, respectively, of the plug, the connecting portion between the two folds or members being passed over one end or edge thereof, said outer fold being drawn outwardly away from the plug in removing the latter, as set forth.

2. As an article of manufacture, an extractor for plug-tobacco and

other articles designed to be applied to each article and pushed therewith, consisting of a flexible strip having inner and outer folds or members and an intermediate connecting portion, said inner fold or member having teeth at its inner end, the outer end of the outer fold or member being bent or turned up, as and for the purpose set forth.

3. A box or caddy of plug-tobacco having the several plugs packed in rows, one upon another, and a separate extractor for each plug packed therewith and detachably engaging the same, each extractor having a flexible portion by pulling on which the extraction of a plug is effected, as set forth.

4. A box or caddy of plug-tobacco having the several plugs packed in rows, one upon another, and a separate extractor for each plug packed therewith, said extractors engaging the several plugs at the ends or edges thereof, and having each a flexible portion extended over the outer face of its respective plug, as set forth.

702,295. WIRE-STRUTTER. HENRY L. FISKE, Harvard, Ill., assignor to Hunt, Main, Firth & Company, Harvard, Ill., a Copartner ship. Filed Oct. 2, 1901. Serial No. 73,021. (No model.)

Claim.—1. In a wire-strutter, the combination with a bar notched upon the opposite sides, of a hollow rectangular slide, comprising a metal plate cut away upon its sides to form a narrowed central portion, a second plate, similarly cut away and having its narrowed central portion turned to form a yoke, and suitable struts connecting said upper and lower plates, a lever pivoted between its ends to the opposite plates of the slide, and bar-engaging dogs pivoted to the lower upon opposite sides of the pivot, between the lever and the slide; substantially as described.

2. In a wire-strutter, the combination with a bar notched upon the opposite sides, of a hollow rectangular slide, comprising a metal plate cut away upon its sides to form a narrowed central portion, a second plate similarly cut away and having its narrowed central portion turned to form a yoke, a suitable outwardly-projecting lug upon each of said plates, said lugs being arranged opposite one another, a lever pivoted between its ends to the opposite plates of the slide, and bar-engaging dogs pivoted to the lower upon opposite sides of the pivot between the lever and the slide; substantially as described.

702,296. HORSESHOE. ROBERT R. PIER, West Nashville, Tenn. Filed Nov. 2, 1901. Serial No. 81,728. (No model.)

Claim.—1. A horseshoe formed with grooves in its inner and outer edges, beginning at a point near the center of the toe portion and terminating in advance of the heel, a calk having a base and vertical flanges secured thereto, tangens carried by said flanges and adapted to fit within said grooves, whereby the calk is secured to the shoe, and means for securing the calk against displacement.

2. A horseshoe formed with grooves in its inner and outer edges beginning at a point near the center of the toe portion and terminating in advance of the heel, a cut-out portion communicating with the groove in the inner flange and the under side of the shoe, a recess in the front end at the top of the toe portion, a calk having a base and vertical flanges at opposite ends thereof, tangens secured to the flanges to engage in the grooves, the front flange being extended vertically adapted to fit in said recess and formed with a prong adapted to be driven into the hoof of the animal.

3. As a new article of manufacture, a calk for a horseshoe, consisting of a base-plate having the calk fixed to the under side thereof, a vertical flange at the inner end of the base formed with a rib or tongue across its inner face, and a vertical flange at the outer end of the base formed with a rib across its inner face, and an upward extension formed with a prong, substantially as and for the purpose specified.

702,297. LAP-RIDER. JOHN T. FURTER, Dandenong, Victoria, Australia. Filed Sept. 11, 1901. Serial No. 78,088. (No model.)

Claim.—1. A stomach, leg, and saddle cover for horsemen, comprising a body of suitable material, a flap at the upper end of and turned back upon and underneath said body, means for retaining the flap in said position, the pocket so formed being designed to be passed over the crupper end of a saddle for the protection of the saddle, substantially as described.

2. A stomach, leg and saddle cover for horsemen, comprising a body of suitable material, a flap at the upper end of and turned back upon and underneath said body, and a strip of flexible material secured thereto for retaining the flap in said position, the pocket so formed being designed to be passed over the crupper end of a saddle for the protection thereof, substantially as described.

3. A stomach, leg and saddle cover for horsemen, comprising a body of suitable material, a flap turned back upon the same, and a strip of elastic material folded in the edge of said flap and secured thereto and also secured to said body for retaining said flap in its turned-back position, the pocket so formed being designed to be passed over the crupper end of a saddle and to protect the same for the protection thereof, substantially as described.

4. A stomach, leg and saddle cover for horsemen comprising a body of suitable material, a downwardly-opening pocket formed at the upper end thereof, designed to be passed over the crupper end of a saddle, and means carried by said body for securing its lower end to the front of said saddle, substantially as described.

5. A stomach, leg and saddle cover, comprising a body of suitable flat material, bifurcated, and the legs being designed to be passed on either side of a saddle, straps carried by said body for securing the same to the front end of said saddle, and means formed on said body for securing the upper end thereof about the crupper end of the saddle, substantially as described.

6. In a device of the class described, the combination with a belt designed to encircle the waist of the user and provided with safety-eyes, of a bifurcated piece of material, each leg of the bifurcation being designed

to inclose one of the legs of the user, and straps carried by the upper portion of said piece of material for engaging said safety-eyes, substantially as described.

7. In a device of the class described, the combination with a belt designed to encircle the waist of the user and provided with safety-eyes, of a bifurcated piece of material, one leg of the bifurcation being designed to inclose each leg of the user, a strap secured to and extending across the upper portion of said piece of material, and straps carried near the ends of said strap and designed to engage said safety-eyes, substantially as described.

702,298. PLAYING-CARD. LEO FRANKENBERG, Chicago, Ill. Assignor of one-half to Harry W. Perry, Chicago, Ill. Filed May 2, 1901. Serial No. 84,044. (No model.)

Claim.—1. A pack or set of playing-cards having on their faces a portion of the music-staff, a clef-mark and different notes placed thereon, notes of different values being used to mark different suits in the pack, substantially as described.

2. A pack or set of playing-cards, having on their faces a portion of the written or printed music-staff with the clef-sign and different notes thereon, the suits being represented by the different values of the notes, the whole notes constituting one suit, the half-notes another suit, the quarter-notes a third suit, and the eighth-notes a fourth suit, substantially as shown and described.

3. A pack or set of playing-cards having on their faces a portion of the music-staff, some having the sign of the treble clef and different notes thereon, from C on the line below the staff to A on the line above the staff, and others having the sign of the bass clef and different notes on the staff, from E on the line below the staff to C on the line above the staff, the cards in the pack constituting suits of thirteen cards each, all of the whole-note cards in the treble clef forming one suit, all of the half-note cards in the treble clef another suit, all of the quarter-note cards in the treble clef a third suit, and all of the eighth-note cards in the treble clef a fourth suit, and all of the whole-note cards in the bass clef forming a suit, all of the half-note cards in the bass clef another suit, all of the quarter-note cards in the bass clef a third suit, and all of the eighth-note cards in the bass clef a fourth suit, substantially as shown and described.

4. A pack or set of playing-cards showing on their faces a portion of the music-staff with the sign of the clef and different notes thereon, divided into several suits of an equal number of cards each, all the cards of each suit differing in time value of their notes from all the cards in all of the other suits, and the notes or notes on each card in any suit differing in name or position on the staff from all the notes on all the other cards in the same suit, substantially as shown and described.

5. In a pack or set of playing-cards, each card having on its face a portion of the music-staff with the sign of the clef and a natural note of the scale thereon, the printing of the sharp note of the same name at one side of the natural note and the flat note of the same name on the other side of the natural note, the signs of the sharp and the flat being used, substantially as shown and described.

702,299. ELECTRIC CLOCK. FRANK FRANK, Waynesboro, Va. Filed Sept. 18, 1901. Serial No. 78,088. (No model.)

Claim.—1. In an electric clock, the combination of an escape-wheel, means for applying power to said escape-wheel, and means for controlling the movement of said escape-wheel, which last means is operated by this means for applying the power to the escape-wheel.

2. In a secondary clock, the combination, of the frame, the magnet, the armature, the driving mechanism, an escape-wheel mounted on an arbor, a wheel mounted loosely on said arbor alongside said escape-wheel, a spring connected to the escape-wheel at one end and connected at its other end to said loosely-mounted wheel, connections from the armature to said escape-wheel for controlling its movement, and

connections from said armature to said loosely-mounted wheel for moving it with said escape-wheel, substantially as set forth.

3. An electric clock comprising an escape-wheel connected with means for holding it under a constant forward tension, means for maintaining the tension, means for controlling the escape-wheel, and an armature connected both with the means for maintaining the tension of the escape-wheel, and with the means for controlling its movement, whereby both are operated from the same armature, substantially as set forth.

4. In an electric clock, the combination, of the frame, and the operating mechanism comprising a magnet, an armature, a pivoted lever connected with said armature, an escape-wheel, the pallet, a connection between said pallet and said lever, a connection between said lever and a winding-wheel, said winding-wheel, a coiled spring mounted around the arbor on which said wheel is mounted with one end connected in the escape-wheel and the other to said winding-wheel, and means for holding said parts against backward movement, substantially as set forth.

5. In an electric clock, the combination, of the frame, the magnet, the train of gears, the escape-wheel mounted rigidly on its arbor, said arbor, the pallet also mounted rigidly on its arbor, said arbor, a second wheel mounted loosely on the escape-wheel arbor alongside said escape-wheel, a coiled spring surrounding said arbor and connected at one end to said escape-wheel and at its other end to said loosely-mounted wheel, means for holding said wheels against backward movement, an armature mounted on one end of a lever adjacent to the pole of the magnet, said lever mounted on an arbor, said arbor, a connection from said arbor to the arbor of the pallet for operating said pallet, and a pawl on said lever engaging the teeth of said loosely-mounted wheel for advancing it as said escape-wheel advances, whereby the tension of said spring is maintained, substantially as set forth.

6. An electric clock comprising an escape-wheel, a spring arranged with its tension directed to move said escape-wheel forward, means for positively locking and releasing said escape-wheel, and a single operating mechanism to maintain the tension of the spring and to operate the escape-wheel-controlling device, substantially as set forth.

7. In an electric clock, the combination of the escape-wheel, means for positively locking and releasing said escape-wheel, a spring for forcing the said escape-wheel forward, mechanism for winding said spring to maintain its tension, and an armature connected both with the escape-wheel-controlling device and the mechanism for winding the spring for operating them, whereby both are positively and simultaneously operated, substantially as set forth.

8. In an electric clock, the combination of an escape-wheel, means for controlling it, means for operating it, a single armature connected to both the controlling and the operating means, and the magnet for controlling the operation of the armature, substantially as set forth.

9. In an electric clock, the escape-wheel, the pallet or verge, the magnet, an armature, a connection from said armature to said verge for operating it, a spring for forcing the escape-wheel forward, and mechanism for maintaining the tension of said spring operated through a connection with the same armature, substantially as set forth.

702,300. COMBINED SHAFT SUPPORT AND COUPLING. HARRY HARRIS, London, Ohio, assignor of one-half to Missouri Carter and John Carter, London, Ohio. Filed Sept. 21, 1901. Serial No. 78,088. (No model.)

Claim.—1. In a combined shaft support and coupling, a shaft being connected with a member constituting a keeper, said shaft being connected

to the shaft, and a shaft carrying a pivoted spring-pressed lengthwise-adjustable latch for engaging the keeper.

2. In a combined shaft support and coupling, a shaft carrying a plate, a pivoted adjustable latch carried by the plate, and a latch-actuating spring secured to the plate and having a yoke or looped end to engage the latch.

3. In a combined shaft support and coupling, a shaft carrying a plate, a pivoted latch carried by the plate and having a limited range of downward movement, and a latch-actuating spring secured to the plate and having a yoke or looped end to engage the latch.

4. In a combined shaft support and coupling, the combination with an axle of a shaft having one member constituting a keeper, and the other member one element of a shaft-coupling, and a pivoted spring-pressed latch to engage the extremity of the keeper, substantially as and for the purpose specified.

702,301. MACHINE FOR COMBING WOOL. DR. ISRAEL HAY, Oakworth, England. Filed Nov. 22, 1901. Serial No. 84,012. (No model.)

Claim.—1. A combing-machine comprising in its construction a comb and a series of inclined blades of varying length, the shorter ones being mounted to depress the fibres into the comb after the action of the longer blades and at points nearer the outer or free ends of the fibres.

2. A combing-machine comprising in its construction an outer comb and an inner comb, and a series of inclined blades of varying length, the shorter ones being mounted to depress the fibres into the comb after the action of the longer blades and at points nearer the outer or free ends of the fibres.

3. In combing machinery of the class described, circular combs mounted to rotate in contiguity with each other, fiber-depressing blades of varying length mounted in position relatively with the several rows of teeth to gradually and successively depress the fibres into said combs, and a guard-plate cut away to allow the fibres substance to be brought into contact with the comb arranged first to receive it and extended at the proper part to also allow the fiber to be brought into contact with the teeth of the next or succeeding comb substantially as herein specified.

4. In combing machinery of the class described, the combination with circular combs mounted to rotate in contiguity with each other, of fiber-depressing blades of varying length mounted to gradually and successively force the fibres substance upon the teeth of the combs, and lever-arms and connections for releasing the power from the machine.

5. A combing-machine comprising in its construction circular combs operative in contiguity with each other and a series of fiber-depressors mounted and relatively arranged to gradually and successively depress the fibres into the combs, said depressors first acting on the fibres at points distant from their free ends and then at points nearer the outer ends of the fibres, substantially as and for the purpose described.

702,302. COMB FOR COMBING-MACHINE. ISRAEL HAY, Oakworth, England. Filed Nov. 22, 1901. Serial No. 84,012. (No model.)

Claim.—In combing machinery of the class described, combs having their pins or teeth leading in the direction of or toward their path of motion, in combination with incline plates located in the path of movement of said pins or teeth and the fibrous substances carried thereby.

702,808. ROLLING MACHINERY. BUREAU W. HARTEN, Berlin, Germany. Filed Mar. 30, 1901. Serial No. 52,748. (No model.)

Claim.—1. In a rolling-mill the combination of a pair of positively-driven rolls one member of which is tapered and means for tipping or tilting one member axially along the other so as to cause any point along its length to cooperate with the corresponding point along the length of the other member to work the plate between them in the manner and for the purpose substantially as described.

2. In a rolling-mill the combination of a pair of positively-driven rolls, one member of which is tapered and means for tipping or tilting one member axially along the other so as to cause the longitudinal surfaces of the two rolls to contact with the metal between them at corresponding points consecutively throughout the length of both rolls and means for pivotally supporting the metal to rotate in an approximately horizontal plane between the said rolls substantially as described.

3. In a rolling-mill the combination of a pair of positively-driven rolls, one member of which is tapered toward its ends and provided with a corrugated longitudinal section, the second member being also provided with corresponding corrugations and means for tipping or tilting one member longitudinally on the other so as to cause the corresponding points along the length of the two rolls to contact with the metal between them in the manner and for the purpose substantially as described.

4. In a rolling-mill the combination of a pair of positively-driven rolls one member of which is tapered toward the ends and both members of which are provided with corrugated longitudinal sections the convex parts of one being adapted to engage the concave corrugations of the other, means for tipping or tilting one member along the other axially, so as to cause the corresponding points of the length of both rolls to contact with the metal between them consecutively and means for pivotally supporting the plate or metal being worked at a point slightly distant from one end of the two rolls in the manner and for the purpose substantially as described.

702,804. ROLLER. EDWIN H. HULME and JAMES E. HOOVER, Columbus, Ohio; said Hoover assignor to said Hulme. Filed Mar. 3, 1902. Serial No. 94,099. (No model.)

Claim.—1. In combination with a rest and the part to which it is to be attached, a hinge connecting them, a toothed arm, having legs projecting therefrom at the extremities of the toothed portion thereof, a pawl arranged to be shifted by said legs into and out of position to be engaged by the toothed portion of said arm, and a catch independent of said arm for holding said pawl firmly in each of the two positions to which it is shiftable.

2. In combination with a rest and the part to which it is to be attached, a hinge connecting them, a toothed arm, having legs projecting therefrom at the extremities of the toothed portion thereof, a pawl arranged to be shifted by said legs into and out of position to be engaged by the toothed portion of said arm, and a spring-actuated pawl having two ends 5° and 5° to engage said pawl and into which said pawl is shifted from one to the other for holding said pawl in and out of position to be engaged by the teeth of said arm, substantially as described.

3. In combination with a rest and the part to which it is to be attached, a hinge connecting them, a curved arm toothed on its edge nearest the pin of said hinge, and having legs projecting therefrom at the extremities of the toothed portion thereof, a pawl arranged to be shifted by said legs into and out of position to be engaged by the intermediate teeth, and a spring for engaging said pawl having two ends into one or the other of which said pawl is shifted by contact with said legs to hold said pawl firmly in the position to which it is shifted, substantially as described.

702,805. PROCESS OF EXTRACTING PRECIOUS METALS FROM THEIR ORES. EDWARD D. KENDALL, Brooklyn, N. Y. Filed Feb. 27, 1901. Serial No. 46,098. (No specimens.)

Claim.—1. The process of treating ores carrying precious metals, which consists in treating such ores with a fixating solution, consisting of a cyanid, potassium persulfate and water, substantially as described.

2. The process of treating ores carrying precious metals, which consists in treating such ores with a fixating solution, consisting of a cyanid, potassium persulfate, and water, and finally extracting the precious metal from such fixative, substantially as described.

3. The process of treating ores carrying precious metals which consists in treating such ores with a fixating solution, consisting of potassium cyanid, potassium persulfate and water, substantially as described.

4. The process of treating ores carrying precious metals which consists in treating such ores with a fixating solution, consisting of a cyanid of substantially from one-tenth to one-half per cent. by weight, potassium persulfate and water.

702,806. SLED. ARTHUR F. LAMBERTSON, Chicago, Ill. Filed May 20, 1901. Serial No. 92,369. (No model.)

Claim.—A sled constructed from a U-shaped blank, with runners, a flat cross-bar connecting the forward ends of the runners, vertical knees, and a rectangular body surrounding the knees formed with upwardly-flaked side portions and with vertically-flaked and portions having inwardly-flaked rings of the same width as and located over the knees and meeting the sides on vertical lines edge to edge and flush therewith whereby the openings formed by the formation of the knees, side portions and rings are closed.

702,807. BOOK-SUPPORT. JAMES H. LORRA, Bryn Mawr, Pa. Filed Mar. 1, 1901. Serial No. 92,368. (No model.)

Claim.—1. A book support and holder, consisting of a concave base, and standards rising therefrom in parallel to each other, a wire ledge adjustable along said standards, and having a rest portion, arms on opposite sides of said book portion, and a weighted thread connected to one of said arms, and adapted to engage the other, substantially as specified.

2. A wire book support and holder consisting of a base adapted to

rest on the person, and having two parallel standards carrying a longitudinally-adjustable book-ledge, a neck cord or ribbon adjustable for length connected to the support, and a weighted thread adapted to be held across the pages of the book, substantially as specified.

2. A wire book-support having a transverse base, parallel standards rising therefrom, an adjustable clamp on said standards, a weighted cord for holding the book open, in combination with a neck-cord adjustable for length and a prop adjustable for length, substantially as specified.

3. A book-support consisting of the transverse base, the standards rising therefrom, the adjustable book-ledge on said standards, the adjustable slide upon said standards having laterally downwardly-extending blades for holding the book open, and the weighted cord for holding the book open, substantially as specified.

4. A book support and holder, having the transverse base, a standard rising therefrom, a longitudinally-adjustable book-ledge upon said standard, a cord adapted to engage the person of the reader and adjustable for length for holding the support in proper position for reading, and a weighted cord carried by the book-ledge for holding the book open, substantially as specified.

702,808. SAFETY-PIN. GEORGE W. LAMOT, Atlanta, Ga. Filed Sept. 7, 1901. Serial No. 74,574. (No model.)

Claim.—1. A safety-pin comprising a body portion, a resiliently-secured pin projecting therefrom, a catch carried by one end of the body portion and adapted to be engaged by the pin, a loop extending from the body portion through which the pin projects, and a guard for normally holding the pin in engagement with the catch.

2. A safety-pin constructed of a single piece of wire bent to form a body portion, a resiliently-secured pin projecting therefrom, a catch formed at one end, the strand being coiled around the body portion for a portion of its length, said coils terminating at the juncture of the pin with the body portion, the strand then being bent and coiled toward the catch and formed at its extremity with a loop through which the catch projects and which is adapted to bear against the pin to hold it in a locked position.

3. The combination with a body portion having a resiliently-secured pin at one end thereof, a catch at the other end, said pin adapted to engage the catch, a spring-bar secured to the body portion near the junction of the same with the pin, the free end of said bar extending adjacent the catch and a loop-guard formed on the free end of said bar and through which the catch projects, said loop being adapted to bear against the under side of the pin to hold it in a locked position with relation to the catch.

702,809. KEEF FOR BLEACHING. DR. WALTER W. L. LEMMON, Cornubria, England, and THOMAS W. HANCOCK, Canterbury, and JOHN J. KIMFATHER, Ballyclare, Ireland, assignors to the Litchman Process Bleaching Company, Limited, Cornubria, England. Filed Mar. 18, 1901. Serial No. 91,268. (No model.)

Claim.—1. In a keef, and in combination, an open false bottom, means for securing it therein, a further movable open false bottom situated over it, a screw carried by the movable bottom, a worm-wheel forming a nut for said screw, means for holding the nut and allowing it to rotate, and a worm for rotating the nut to raise and lower the screw and bottom.

2. In a keef, a fluid-inlet pipe 20, 23 respectively at either end of same, a circulating-pipe 22 connecting such inlet-pipes, valves for each inlet-pipe, a connection 25 in each circulating-pipe communicating with a source of liquid supply, a steam-injector 26 in circulating-pipe 22 for moving the liquid therein in one direction, a steam-injector 27 in inlet-pipe 20 for moving the liquid in the other direction, a steam-pipe 28 communicating with inlet-pipe 23 for introducing a large body of steam into one end of the keef, a steam-pipe 29 communicating with the circulating-pipe 22 and inlet-pipe 20 for introducing a large body of steam into the other

end of the keef, and a discharge-pipe 30 communicating with the inlet-pipe 20.

702,810. BROODER. JEROME L. MAUT, Des Moines, Iowa. Filed July 18, 1901. Serial No. 92,599. (No model.)

Claim.—1. In a brooder, the radiator open at its bottom and formed with side and end bars and a top plate fixed thereto, said top plate consisting of plates spaced apart and packed with mineral wool, a slide-bearing for a thermometer on one of the side bars of said radiator, the thermometer extending through an opening in the roof of the chick-chamber, a fan leading from a lamp, a damper controlling said fan, an air-pipe 49 leading laterally from said fan within and along these sides of the radiator and out through the top plate thereof, a fan surrounding the first fan and spaced apart therefrom and a ventilating-pipe 43, leading laterally from the outer fan concentric with the air-pipe and extending part way across the radiator and terminating with an open end within the radiator.

2. In a broader, the radiator open at its bottom throughout its length and width and formed of side and end bars and a top plate fixed thereto, a slide-bearing for a thermometer on one of the side bars of said radiator, the thermometer extending through an opening in the roof of the chick-chamber, a line leading from a lamp, a damper controlling said line, an air-pipe leading laterally from the line within and along three sides of the radiator and out through the top plate thereof, a line surrounding the first line and spaced apart therefrom and a ventilating-pipe leading laterally from the outer line concentric with the air-pipe and extending part way across the radiator and terminating with valve opening laterally toward the center of the radiator immediately beneath the top plate thereof, and having fixed to said depending from the sides of the radiator.

3. In a broader, the chick-chamber, the radiator therein, flange depending from said radiator, the slide-bearing on one of said flanges, an opening in the top of the chick-chamber and the thermometer mounted for vertical movement in said slide-bearing and opening in said chick-chamber.

4. In a broader, the combination of a chick-chamber, a radiator therein, having depending from said radiator, a slide-bearing for a thermometer on said radiator, a lamp-chamber containing a lamp, and a thermostatic-controlled heat-conductor connecting said lamp-chamber with said chick-chamber and the radiator therein.

5. In a broader, the combination of three compartments, one a chick-chamber, another a lamp-chamber, and the third an upper chamber, doors opening into each compartment and from the upper compartment to the chick-chamber, a radiator and depending therefrom in the chick-chamber, a thermometer mounted in a slide-bearing on said radiator and extending through the roof of the chick-chamber into the upper chamber, ventilating-pipes connecting the chick-chamber and the upper chamber, a lamp in the lamp-chamber, a heat-conductor starting in the lamp-chamber traversing the chick-chamber and ending in the upper chamber, and a damper in the upper chamber to control the heat regulated by a thermostatic cell in the chick-chamber.

702,811. GAS-LIGHTING DEVICE. GEORGE MEIER, Berlin, Germany. Filed Jan. 11, 1902. Serial No. 32,344. (No model.)

Claim.—1. The combination, with a diaphragm, of a chamber arranged on each side of said diaphragm and including same, the lower chamber having a gas-inlet and a narrow central pipe reaching therefrom to near the diaphragm, the upper chamber having a wide central pipe reaching inward to near the diaphragm and leading outward to the chief burner, said pipes separated by said diaphragm a wide passage leading from the gas-inlet of said lower chamber to said upper chamber, a narrow pipe leading from said lower chamber to the subsidiary or igniting burner, and yielding means for pressing said diaphragm against the end of the central pipe of said upper chamber at a low gas-pressure and allowing said diaphragm to bear against the central pipe of said lower chamber at the normal gas-pressure, substantially as set forth.

2. In combination, a diaphragm having a chamber arranged on each side thereof, an outlet-pipe for one of said chambers, an inlet-pipe for the other of said chambers, a passage opening into the inlet-pipe of one chamber and opening into the other of said chambers for supplying gas thereto, a gas-outlet passage communicating with one chamber and extending partly around the other of said chambers, and valves carried by the diaphragm and engaging the said pipes for suitably closing them.

3. In combination, a casing, a diaphragm mounted therein and dividing the casing into an upper and a lower chamber, an outlet-pipe for the said upper chamber, an inlet-pipe for the said lower chamber, a passage communicating with the inlet-pipe of the lower chamber and opening into the upper chamber for supplying gas thereto, a gas-outlet passage for said lower chamber, and a pair of valves connected approximately centrally to the said diaphragm and adapted to engage with said pipes for suitably closing them.

4. In combination, a casing, a diaphragm mounted therein and dividing the casing into an upper and a lower chamber, an outlet-pipe for said upper chamber, an inlet-pipe for said lower chamber, a passage communicating with the inlet-pipe of the lower chamber and opening into the upper chamber for supplying gas thereto, an outlet-passage for said lower chamber, means extending in the inlet-pipe for regulating the passage of gas therethrough, and means extending in the said outlet-pipe for regulating the passage of gas therethrough.

702,812. DUST-COLLECTOR. JOHN R. HEDGECOCK, St. Louis, Mo. Filed Feb. 27, 1902. Serial No. 32,373. (No model.)

Claim.—1. In a dust-collector, the combination with a drum into which dust-laden air is introduced, filtering-pockets communicating with said drum, and a cut-off chamber for successively cutting off said pockets from said drum, of a back-draft or suction fan independent of the fan for forcing the dust-laden air into said drum, and having its inlet-opening communicating directly with said cut-off chamber.

2. In a dust-collector, the combination with a drum into which dust-laden air is introduced, filtering-pockets communicating with said drum, and a cut-off chamber for successively cutting off said pockets from said drum, of a back-draft or suction fan located within said drum, and having its inlet-opening communicating directly with said cut-off chamber.

3. In a dust-collector, the combination with a drum into which dust-laden air is introduced, filtering-pockets communicating with said drum, and a cut-off chamber for successively cutting off said pockets from said drum, of a back-draft or suction fan located within said drum, independent of the fan for forcing the dust-laden air into said drum, and having its inlet-opening communicating directly with said cut-off chamber.

4. In a dust-collector, the combination with a drum into which dust-laden air is introduced, filtering-pockets communicating with said drum, and a cut-off chamber for successively cutting off said pockets from said drum, of a back-draft or suction fan, and a longitudinally-extending partition at one end of said chamber, forming two passages, one of which has its upper end open, and the other of which has its upper end closed and communicates directly with the inlet-opening of said fan.

5. In a dust-collector, the combination with a drum into which dust-laden air is introduced, filtering-pockets communicating with said drum, and a cut-off chamber for successively cutting off said pockets from said drum, of a back-draft or suction fan located within said drum, and a partition in said cut-off chamber extending longitudinally thereof from the end adjacent to said fan to a point intermediate its ends, the said partition forming two passages, one of which has its upper end open, and the other of which has its upper end closed and communicates directly with the inlet-opening of said fan.

702,813. STOVE-DAMPER. WILLIAM C. MONTGOMERY, Erie, Pa. Assignor of one-half to Michael F. Peck, Erie, Pa. Filed Mar. 25, 1902. Serial No. 32,113. (No model.)

Claim.—1. The combination in a damper, of a slotted plate, bridges on one side of the plate connecting the two halves thereof together, lugs on the opposite side of the plate overhanging the slot therein, a spindle having slots in opposite sides thereof through which the lugs on the plate will pass, flattened surfaces on one side of the spindle adapted to pass under the lugs on the plate, and a spring on the cheek of the spindle, substantially as and for the purpose set forth.

2. The combination in a damper, of a damper-plate having a central transverse slot therein, semicircular bridges or connections on one side of the plate connecting the two halves thereof together, two sets of lugs

on the opposite side of the plate overhanging the slot therein, a round spindle having two sets of transverse slots in the sides thereof through which the lugs on the plate will pass when the spindle and plate are brought together, flattened surfaces on said spindle adapted to pass under and engage the lugs on the plate, and a spring on the cheek of the spindle, substantially as and for the purpose set forth.

702,814. ELECTRO-TUBE LIGHTING. DANIEL H. MOORE, New York, N. Y. Filed Dec. 13, 1901. Serial No. 32,327. (No model.)

Claim.—1. In an electric-lighting system wherein the light is produced by electrical agitation of a rarefied gas or vapor, a lamp of glass having its light-giving portion extended longitudinally to give a gaseous column of great length, as and for the purpose set forth.

2. In an electric-lighting system wherein the light is produced electrically in a rarefied gas or vapor, a lamp of glass having its light-giving portion extended longitudinally to give a gaseous column of great length, as and for the purpose set forth.

3. An electric lamp substantially as described, comprising a glass tube containing a rarefied gas or vapor and having opaque conducting sleeves, caps or terminals through which electric energy is supplied by electrostatic action to the contents of the tube at the terminals or ends thereof, the translucent portion of said tube between terminals being elongated or extended longitudinally as described to give a great length of luminous column with relation to the length of cap or terminal, as and for the purpose set forth.

4. In an electric lamp containing a rarefied gas or vapor to be rendered luminous by electric energy supplied at the terminals of the glass column, a glass tube provided with conducting terminals or caps applied in the exterior thereof, said tube being elongated as described longitudinally to give a great length of light-giving tube as compared to the length of cap or terminal, as and for the purpose set forth.

5. In an electric-lighting system wherein the light is produced by the electrical agitation of a rarefied gas or vapor contained in a translucent receptacle, a tube-lamp having a gaseous column of great length included between the conducting caps or terminals which supply energy to the contents of the tube, substantially as and for the purpose described.

6. An electric lamp consisting of an all-glass tube containing a rarefied gas or vapor and having conducting sleeves, caps or terminals through which the electric energy is supplied by electrostatic action to the contents of the tube, said tube being elongated as described to increase the length of the luminous column with relation to the length of conducting caps or as to secure a more useful expenditure of energy in overcoming the total resistance of the lamp, as and for the purpose described.

702,815. ELECTRO-TUBE LIGHTING. DANIEL H. MOORE, New York, N. Y. Filed Dec. 13, 1901. Serial No. 32,328. (No model.)

Claim.—1. In an electric-lighting system, a translucent non-conducting tube or receptacle containing a gas or vapor adapted to be rendered luminous when electrically agitated and disposed as described throughout the area or space to be illuminated and terminating at its ends in a suitable box or receptacle where it is provided with conducting caps or terminals adapted for connection to the source of electric energy and for rendering its gaseous contents luminous.

2. In a system of electric lighting, a translucent tube disposed or located through a room or rooms of a building and terminating at its ends in a box or receptacle where it is provided with suitable conducting caps or terminals and means whereby they may be protected or sealed against contact or disturbance and connected to a suitable source of electric energy, said tube containing only a rarefied gas or a vapor adapted to be rendered luminous when agitated electrically by the energy supplied to said caps or terminals.

3. In a system of electric lighting, a translucent tube disposed or located through a room or rooms of a building and terminating at its ends in a box or receptacle where it is provided with suitable conducting caps or terminals and means whereby they may be protected or sealed against contact or disturbance and connected to a suitable source of electric energy, said tube containing only a rarefied gas or a vapor adapted to be rendered luminous when agitated electrically by the energy supplied to said caps or terminals.

4. In a system of electric lighting, a translucent tube disposed or located through a room or rooms of a building and terminating at its ends in a box or receptacle where it is provided with suitable conducting caps or terminals outside of said room or rooms, and means whereby they may be protected or sealed against contact or disturbance and connected to a suitable source of electric energy, said tube containing only a rarefied gas or vapor adapted to be rendered luminous when agitated electrically by the energy supplied to said caps or terminals.

5. An improved electric-lighting system comprising an alternating-current transformer supplied with a suitable alternating-current main combined with a sealed translucent tube of glass containing the light-radiating vapor and having its two metallic electrodes located in immediate connection with the terminals of the secondary of said transformer, while its radiating or light-giving portion is distributed through or over the space to be illuminated.

6. In a high-potential system of electric lighting, an electric lamp consisting of lengths of glass tubing joined together in situ and forming substantially all of the high-potential circuit, said lamp having terminal sections provided with suitable conducting-electrodes connected with a source of energy proper for rendering the gaseous contents of the tube luminous.

7. In a high-potential system of electric lighting, an electric lamp consisting of lengths of glass tubing joined together and forming substantially all of the high-potential circuit, said lamp having terminal sections provided with suitable conducting-electrodes connected with a source of energy proper for rendering the gaseous contents of the tube luminous.

8. In an electric-lighting system, the combination of a tube of glass or other translucent material having a luminous or light-giving column of light-radiating gas of considerable length as compared with the length of the terminal energy-supplying caps or electrodes, said tube being of a form which returns upon itself as described so as to bring said electrodes into proximity, and a suitable static transformer having its primary supplied with alternating current and having its secondary terminals connected to the tube caps or electrodes directly.

9. An electric lamp consisting of a tube of glass returned upon itself so that its ends will be brought into proximity to one another for the purpose described, said tube containing a rarefied gas adapted to be rendered luminous by the application of electric energy and being provided with conducting caps or electrodes applied upon its terminals, as and for the purpose described.

10. In an electric-lighting system, the combination substantially as described of lighting-tubes containing a rarefied gas or vapor and disposed or described through the area or space to be lighted, and alternating-current mains carrying currents of the usual commercial frequency, supplying energy to conducting-terminals of said tube located in a suitable protecting inclosure, as and for the purpose described.

702,816. ELECTRIC-TUBE LIGHTING. DANIEL M. MOORE, Newark, N. J. Filed Dec. 18, 1901. Serial No. 85,300. (No model.)

Claim.—1. The novel system of electric lighting herein described, comprising lamps consisting of sealed tubes of glass containing a rarefied gas or vapor and provided with conducting caps or terminals such as described, in combination with alternating-current supply-mains furnishing alternating currents of established commercial frequency and voltage substantially as herein set forth.

2. The system of electric lighting hereinbefore described, and comprising electric lamps which consist of tubes of glass containing a rarefied gas and provided with conducting-electrodes as set forth, and alternating-current mains carrying alternating currents of the commercial frequency and voltage as described, and a potential-raising transformer interposed between said mains and the lamps.

3. The system of electric lighting hereinbefore described and comprising electric lamps which consist of tubes of glass containing a rarefied gas and provided with exterior conducting caps or devices such as described, and alternating-current mains carrying alternating currents of the commercial frequency and voltage as described, and a potential-raising transformer interposed between said mains and the lamps.

4. The novel system of electric lighting herein described, comprising lamps consisting of sealed tubes of glass containing a rarefied gas or vapor and provided with conducting caps or terminals such as described, in combination with an alternating-current dynamo source furnishing alternating currents of definite frequency and voltage the area of said conducting caps or terminals being proportioned to said frequency and voltage.

702,817. ELECTRIC-TUBE LIGHTING. DANIEL M. MOORE, Newark, N. J. Filed Dec. 18, 1901. Serial No. 85,300. (No model.)

Claim.—1. In an electric-lighting system, the combination with a luminous gas column excited by regularly-recurring electromotive forces derived from a suitable prime source of energy, of a condenser charged from said source at each extinction of the luminous column by the prime source and adjusted as described to cause additional flashes of light therein, as and for the purpose set forth.

2. The combination of a transparent tube or tubes containing a conducting gas or gases and subjected to a definite number of primary varying electromotive forces per unit of time, and a condenser connected to said tubes and adjusted as described to cause additional flashes of light in said tube or tubes, as and for the purpose set forth.

3. The combination of a transparent tube or tubes containing a conducting gas or gases and subjected to a definite number of primary varying electromotive forces per unit of time, and conducting caps or sleeves for said tube adjusted as described to have a condenser action whereby additional flashes of light may be produced in the tubes.

4. The combination of an alternating-current dynamo or transformer and a tube or tubes having terminals adapted to cause flashes of light additional to the number of dynamo-alternation per unit of time.

5. The combination of an alternating-current dynamo or transformer, a tube or tubes connected thereto and a condenser also connected thereto and designed to cause flashes of light in said tube or tubes additional to those of the dynamo.

6. The combination with an electric lamp comprising a luminous gas contained in a transparent receptacle and excited by rapidly-varying electric vibrations or disturbances, of conducting-electrodes at the terminals of the luminous gas column operating as condenser-plates and by discharging through said column acting to produce additional flashes of light, as and for the purpose described.

7. The combination with a transparent tube containing a gas or vapor properly rarefied so as to be rendered luminous by rapidly-varying electric current passing through the same, of conducting caps or terminals upon said tube having a superficial area designed with relation to the length of the luminous gas column and to the potential of the primary exciting

electromotive force as described so as to act upon the column by an oscillatory condenser-discharge superposed upon the original exciting electromotive force and to produce in said tube additional flashes of light.

8. The combination with an electric lamp containing a column or body of gas rendered luminous by the application of electric energy at the terminals of said column, of a condenser in circuit with said column and with the primary exciting source of currents and having a definite capacity such as described proper for increasing the frequency of the emitted flashes of light.

9. The combination in an electric-lighting system wherein the luminous agent is a column or body of gas, of a generator or source of varying currents connected thereto, and a condenser connected also to the circuit of the generator and lamps, and having its capacity designed with relation to the length or resistance of the gas column and to the inductance of the circuit so as to produce from said column a doubled frequency of emitted flashes of light.

702,818. AUTOMATIC CIRCUIT-INTERRUPTER. DANIEL M. MOORE, Newark, N. J. Filed Jan. 2, 1902. Serial No. 85,008. (No model.)

Claim.—1. In an automatic circuit-interrupter, an actuating-magnet having two coils conspiring to actuate the armature of the interrupter and placed respectively on opposite sides of the break.

2. In an automatic interrupter, the combination substantially as described with a double-wound magnet having its coil on opposite sides of the break, of interrupter-contacts contained in a sealed receptacle and having an armature guided in the walls of said receptacle, as and for the purpose described.

3. In an automatic circuit-interrupter, interrupter-contacts composed respectively of hardened steel and iridium.

4. In an automatic interrupter, a sealed and exhausted receiver containing interrupter-contacts composed respectively of hardened steel and iridium or its equivalent.

5. In an automatic interrupter, a sealed all-glass receptacle containing an armature guided in the glass wall of said receptacle and carrying one of the contacts, and an opposite electrode supported on a stem or column projected into the interior of said receptacle, as and for the purpose described.

6. In an automatic interrupter, the combination with a sealed all-glass receptacle having a stem or column supporting one of the electrodes, and a glass tubular extension in line therewith, of an armature working in said tubular extension and carrying at its lower end an electrode or contact of the interrupter.

7. In an automatic interrupter, the combination substantially as described of a fixed contact supported or carried by a wire sealed in the bulb or column projecting inwardly, and an opposite electrode carried by an armature guided in the wall of said receptacle, of a contact-terminal in the side of said receptacle loosely connected with the armature-contact.

8. In an automatic interrupter, the combination with the receptacle carrying an armature guided in the wall thereof and provided with one of the contacts, and an opposite outspreading contact rigidly supported in the wall of said receptacle, of a socket for said receptacle one member of which is located in proximity to the core of an electromagnet, while the other or opposite support co-operating therewith is a spring-pressed support carrying one of the contact-terminals of the apparatus.

9. In an automatic interrupter, the combination with the sealed receptacle carrying the armature guided in a tubular extension thereof, of a socket adapted to receive said extension, a spring-pressed actuated plunger carrying a contact and a co-operating laterally-pressing spring adapted

to engage with a contact secured in a wall of said receptacle and joined by flexible conductors with the movable contained contact of the device.

10. The combination substantially as described of a base 1 carrying the post 15, an actuating-magnet mounted on said post, the plunger 19 mounted in the base 1, and a socket carried by the supporting-frame for the magnet in line with said plunger, as and for the purpose described.

11. The combination in an automatic interrupter of the base 1, an electromagnet supported over the same by a suitable standard secured to said base and an automatic interrupter consisting of a closed glass receptacle containing an armature to be actuated by the magnet, a socket for receiving the upper end of the receptacle, and a spring-actuated plunger supported in the frame 1 and carrying a contact, as and for the purpose described.

12. The combination with an automatic interrupter having an all-glass receptacle containing the interrupter-contacts, of the snap-switch consisting of the blade-spring 27, provided with an actuating-stem rounded as described and co-operating with two contact-steps and an intermediate pin, as and for the purpose described.

702,819. ELECTRIC-TUBE LAMP. DANIEL M. MOORE, Newark, N. J. Filed Jan. 2, 1902. Serial No. 85,007. (No model.)

Claim.—1. An electric-tube lamp containing a luminous column of gas or vapor and provided with a reflecting-surface extending the whole length of said column, as and for the purpose described.

2. In an electric-tube lamp, a non-conducting reflecting-surface applied over substantially the whole length of the tube, as and for the purpose described.

3. In an electric-tube lamp, a tube having a reflecting-surface beneath its conducting caps or terminals.

4. In an electric-tube lamp, conducting electrodes or terminals at the same side of the tube extending partially around the same.

5. In an electric-tube lamp, conducting electrodes or terminals extending partially around the tube, and paint between the electrodes and tube.

6. In an electric-tube lamp, conducting terminals or electrodes extending partially around the lamp and projecting from a terminal completely encircling the same.

7. In an electric-tube lamp, conducting terminals or electrodes extending partially around the lamp projecting and completely encircling the same, and paint between the electrodes and tube.

8. In an electric-tube lamp, a transparent tube having a square end and an exhaust-ipple applied to the side of the tube, said tube being provided with a conducting cap or terminal extending partially around the same.

9. In an electric-tube lamp, a reflecting-surface consisting of a white paint formed from a composition adapted to adhere to glass and free from discoloration by heating, as and for the purpose described.

10. In an electric-tube lamp of glass, a reflecting-surface of non-conducting material applied to the exterior of the lamp and having superposed upon it a conducting material to form a conducting cap or terminal.

11. In an electric-tube lamp, an exterior reflecting-surface of non-conducting material having a superposed conducting-surface of carbon or similar material as described.

12. In an electric-tube lamp, a conducting cap or terminal superposed upon a reflector applied to said tube, as and for the purpose described.

13. An electric-tube lamp containing a luminous column of gas or

vapor and provided with an adherent reflector of non-conducting material applied to its exterior.

14. An electric-tube lamp having a non-conducting light-reflecting coating of adhesive material.

15. An electric-tube lamp containing a luminous column of gas or vapor and provided with a light-reflecting coating back of the luminous column.

16. An electric-tube lamp containing a luminous column of gas or vapor and provided with a reflector painted upon its exterior.

17. An electric-tube lamp, a coating applied thereto and extending partially around the same and adapted to form condenser-surfaces and to reflect the light.

702,820. ELECTRIC-TUBE LAMP. DANIEL M. MOORE, Newark, N. J. Original application filed Dec. 18, 1901, Serial No. 85,008. Divided and this application filed May 7, 1902. Serial No. 100,261. (No model.)

Claim.—1. An electric lamp consisting of a transparent tube or receptacle containing a rarefied gas or vapor and having conducting caps or terminals applied to a portion of the receptacle whose walls are of reduced thickness.

2. In an electric-lighting system, an electric lamp consisting of a transparent tube or receptacle containing a rarefied gas or vapor and provided with a sectional conducting cap or terminal the sections of which are insulated from one another, as and for the purpose described.

3. An electric lamp consisting essentially of a transparent tube or receptacle containing a rarefied gas or vapor and having an end portion of enlarged superficial area for the application or transfer of electric energy to the contents of said tube.

4. An electric lamp consisting of a transparent tube or receptacle containing a rarefied gas or vapor and terminating in branches each provided with a conducting-cap, as and for the purpose described.

5. In an electric-lighting system, an electric lamp consisting of a transparent tube or receptacle containing a rarefied gas or vapor and provided with a sectional conducting cap or terminal, in combination with means for varying a number of said terminals in action.

702,821. ELECTRIC-TUBE LIGHTING. DANIEL M. MOORE, Newark, N. J. Original application filed Dec. 18, 1901, Serial No. 85,008. Divided and this application filed May 7, 1902. Serial No. 100,262. (No model.)

Claim.—1. The herein-described improvement in electric-tube lighting, consisting in installing a transparent tube and then introducing into the same while in place the gaseous agent which is to be rendered luminous and then exhausting the tube to cause the desired revolution of its contents.

2. The herein-described improvement in treating a transparent tube

designed to contain a luminous gas rendered luminous by electric currents, consisting in introducing the desired chemicals at different points along the tube and exhausting at the end to ensure a thorough and uniform distribution of the chemical, as and for the purpose described.

3. The herein-described improvement in electric-tube lighting, consisting in installing a translucent tube, exhausting the tube and then introducing into the same the material from which the gaseous agent is evolved.

4. The herein-described improvement in electric-tube lighting, consisting in first installing a translucent tube, then exhausting the tube, and finally admitting the gaseous agent.

5. The herein-described improvement in electric-tube lighting, consisting in building up a length of tubing in sections with air-tight joints and distributed over the area to be lighted the end sections of said tube being provided with suitable conducting-terminals, and after the building up of said tube in place, suitably exhausting or treating the same so that the gaseous contents may be rendered luminous by the application of electrical energy to the ends or terminals.

6. The herein-described improvement in electric-tube lighting, consisting in first installing a translucent tube in sections connected by air-tight joints and finally exhausting the tube in place, as and for the purpose set forth.

702,822. MINDER FOR TRUNKS OR PACKAGES. CHRISTOPHER C. F. McGUIRE, Cincinnati, Ill. Filed Feb. 26, 1902. Serial No. 55,542. (No model.)

Claim.—1. A binder for trunks, packages and the like comprising a flexible tie, a straining-lever fitted to one end of the tie and having a series of notches, a pin fitted to the opposite end of the tie and adapted to make adjustable connection with the straining-lever by engagement with any one of the said series of notches, and means for securing the straining-lever after the tie has been tightened, substantially as set forth.

2. A binder for trunks, packages and the like comprising a flexible tie, a straining-lever fitted to one end of the tie and having a loop at one end and corresponding notches along one edge of the side bar of said loop, a pin applied to the opposite end of the tie and adapted to make adjustable connection with the straining-lever by engaging any one of the series of notches thereof, and means for securing the straining-lever after the tie has been tightened, substantially as set forth.

3. A binder for trunks, packages and the like comprising a straining-lever having a loop at one end, a series of notches along one edge of the side bar of said loop, a flexible tie having an end portion folded about the cross-bar of said loop, a pin fitted in a fold at the opposite end of the tie and adapted to enter any one of the notches of the said straining-lever, and means for securing the straining-lever after the tie has been tightened, substantially as set forth.

4. In combination, a flexible tie having its end portions folded, a straining-lever having a hook at one end and a loop at the opposite end, the side bar of the loop having a series of notches along one edge, the cross-bar of the loop being fitted in one of the folds of the tie, a pin inserted in the fold at the opposite end of the tie and adapted to make engagement with any one of the series of notches of the straining-lever, and a link fitted upon the end portion of the tie carrying the straining-lever and adapted to engage over the hooked end of the said straining-lever and secure the same after the tie has been tightened, substantially as set forth.

702,823. IMPROVED CARPET FABRIC. JAMES C. McGUIRE, Philadelphia, Pa. Assignor to James C. McGUIRE, Philadelphia, Pa. Filed Oct. 11, 1901. Serial No. 73,522. (No specimens.)

Claim.—1. A two-ply carpet fabric having the warp-threads homogeneously bound together by binder warp-threads which are disposed singly throughout the fabric, and a stuffer-thread for giving additional body to the fabric and also serving as a figuring-warp which may be disposed

on either face of the fabric at will whereby solid-color portions of the fabric may be produced in connection with one or more of the warp-threads, said stuffer-thread consisting of two ends which are disposed at the face of the fabric in pairs and which are spread by one of the binder-warps during the shedding action while weaving, substantially as described.

2. A two-ply carpet fabric having the warp-threads homogeneously bound together by binder warp-threads which are disposed singly throughout the fabric, said fabric having two acceptable faces, and a stuffer-thread for giving additional body to the fabric and also serving as a figuring-warp which may be disposed on either face of the fabric at will whereby solid-color portions of the design may be produced in connection with one or more of the warp-threads, said stuffer-thread consisting of two ends which are spread by one of the binder-warps when brought to the face of the fabric during the shedding operation in weaving and thereby caused to exert their greatest covering effect and hiding said binder-warp, substantially as described.

3. A two-ply carpet fabric having the warp-threads arranged in sets of four homogeneously bound together by two binder warp-threads arranged singly throughout the fabric, said fabric having two acceptable faces, and a stuffer-thread for giving additional body to the fabric and also serving as a figuring-warp which may be disposed on either face of the fabric and located between the two surfaces of the warp-threads of the fabric at will whereby portions of the design may be produced in solid colors in connection with one or more of the warp-threads, said stuffer-thread being spread by one of the binder-warps during the shedding operation whereby it is caused to exert its greatest covering effect, substantially as described.

4. A two-ply carpet fabric having the warp-threads homogeneously bound together by two binder warp-threads arranged singly, said fabric having two acceptable faces, upon either of which said warp-threads may appear at will, and a stuffer-thread giving additional body to the fabric and also serving as a figuring-warp which may be disposed on either surface of the fabric at will, said stuffer-thread adapted to cover the crossing-points of the warp-threads, whereby each figure of the design may be given a definite and clearly-defined outline and the production of solid-colored figures in connection with one or more of the warp-threads secured, said stuffer-thread being spread by one of the binder-warps during the shedding operation so as to exert its greatest covering effect, substantially as and for the purpose set forth.

702,824. AIR-LOCK FOR GARDEN. WILLIAM HOLLYN, Jersey City, N. J. Filed Apr. 14, 1902. Serial No. 108,908. (No model.)

Claim.—1. An air-lock for gardens, comprising a casing having exterior lateral extensions, upper and lower gates, and means for actuating

said gates to open outside of the casing within the vertical planes of said lateral extensions, and connected within the casing of the gates, as set forth.

2. An air-lock for gardens, comprising a casing having exterior lateral extensions, upper and lower gates, piston-rods connected to said gates and extended outward through the casing, and cylinders for the pistons located on the exterior of the casing within the vertical planes of said lateral extensions, as set forth.

3. An air-lock for gardens comprising a casing having a diametrically-reduced portion, upper and lower gates, piston-rods connected to said gates and extended through the casing parallel with the reduced portion thereof, and cylinders for the pistons of said rods located adjacent said diametrically-reduced portion, as and for the purpose stated.

4. An air-lock for gardens, comprising a gate or gates designed to move upwardly against their seats, vertically-movable piston-rods, and links connecting said rods to the gates, as set forth.

5. An air-lock for gardens having a gate formed in sections and with central meeting edges, each section being hinged or hung at its outer side, vertically-movable piston-rods, and links connected to said rods and to said gate-sections, said links being forced into oblique positions when the gate-sections are against their seat, thereby holding the meeting edges of said sections in firm engagement, as set forth.

6. In an air-lock for gardens, a gate having an opening formed with a recess and a bushing for said opening having a peripheral enlargement fitted in said recess, said bushing having an opening therein for the passage of the rope, as set forth.

7. An air-lock for gardens having a gate formed in two sections with opposite openings in their meeting edges, bushings located in said openings having each a hemispherical cut-away portion forming a rope-opening, and a retaining-cover for each bushing, as set forth.

8. An air-lock for gardens having a gate formed in two sections with opposite openings in their meeting edges, a recess being formed in each opening, a bushing formed in two sections, one for each gate-section, having peripheral enlargements fitting in said recesses, and central cut-aways bolted at their ends and forming collectively a rope-opening, and retaining-covers for said bushing-sections, as set forth.

9. An air-lock for gardens having its gate or door formed in sections, said sections having a rope-opening in their meeting edges, a removable bushing in said opening, having half an opening bolted at its ends, said bushing being formed in two parts, and means for securing each part to its respective gate-section, substantially as set forth.

702,825. APPARATUS FOR THE MANUFACTURE OF NITRO-GLYCERINE. FREDERICK L. BAYNE, JAMES H. FENNELL, and WILLIAM BIRTON, Waltham Abbey, England. Filed Mar. 7, 1902. Serial No. 97,106. (No model.)

Claim.—Apparatus for the manufacture of nitro-glycerine, consisting of a vessel provided with an air-blank pipe, coils for circulation of cooling-water, pipes for supply of acid and of waste acid, a valved arrangement for supply of glycerin and pipes for discharge of the nitro-glycerine produced and of the fumes, substantially as described.

702,826. VALVE. JOSEPH W. BERRY, Indianapolis, Ind., assignor to the Berry Hydraulic Valve Company, Indianapolis, Ind., New York, N. Y., and Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 11, 1901. Serial No. 25,723. (No model.)

Claim.—1. The combination, in a valve, of a casing having an inlet and outlet with a valve-seat between them, a cage with restricted openings in its sides extending up from said seat, a piston valve mounted to operate in the casing above said seat with the valve in said cage and adapted to seat on said valve-seat, a by-pass extending from the chamber above the valve around to the outlet, an automatically-closing valve to said by-pass, and a separate fluid-supply pipe leading into said chamber the inlet whereof is smaller than said by-pass, substantially as set forth.

2. The combination, in a valve, of a valve-casing containing a cage having openings in its sides in which the lower end of the valve travels, and a chamber larger in diameter than said cage and located above the same, the valve-seat being located below said cage, a piston-valve having two heads the lower one of which is adapted to travel within the cage and seat itself on the valve-seat and the upper one of which is adapted to travel within the cylindrical chamber above the cage, and suitable means for opening said main valve, substantially as set forth.

3. The combination, in a fluid-supply system, of the valves in said system connected with a supply-pipe, each of said valves comprising a casing having a valve-seat, a chamber above said seat, a valve therein connected to a piston operating in said chamber, a discharge-opening below said piston, a by-pass leading from above said piston around into said discharge-opening, and a separate fluid-supply pipe leading from the primary source of supply connected with each of said chambers above the piston by an orifice smaller than said by-pass, substantially as set forth.

4. The combination, in a valve, of the main-valve casing, the main valve contained and operating therein, a chamber above said main valve larger in area than the valve-seat, a second supply-pipe leading directly from the primary source of supply communicating through a small passage with said chamber, a discharge-opening leading from said chamber, and an automatically-closing valve to said discharge-opening, said discharge-passage leading into the main outlet to the valve, said main outlet being provided with a reducing-socket outside the point where the said passage discharges therefrom, substantially as and for the purposes set forth.

5. The combination, in a valve, of a casing having a valve-seat, inlet and outlet openings on opposite sides thereof, a chamber above said seat, a valve adapted to open a larger area for the discharge of the fluid as it flows from said seat, a piston operating in said chamber and connected to said valve, a by-pass leading around into the discharge-pipe, and a restriction formed in said discharge-pipe adapted to partially close or restrict its area at a point beyond the point where said by-pass discharges thereinto, a valve to said by-pass, and a separate fluid-supply leading directly from the primary source of supply into said chamber above said piston, substantially as set forth.

6. The combination, in a fluid-supply system, of a main source of fluid-supply, a pipe leading therefrom, a valve-casing connected to said pipe having a suitable chamber therein with a valve-seat of smaller diameter than the large portion of said chamber at one end thereof, a main-valve structure situated in said chamber having a valve at one end of suitable form to rest upon said valve-seat and a piston-head of larger diameter within the chamber, inlet and outlet openings to said valve, a separate pipe leading directly from the source of supply to said valve and communicating with the portion of the chamber above the piston by a passage of small diameter, a by-pass of larger diameter leading from the

portion of the chamber above the piston around and communicating with the opening to the main valve, and a valve to said by-pass.

702,827. PLASTER. ALBERT J. OWEN, OREGON, OR. Filed Dec. 5, 1901. Serial No. 84,520. (No model.)

Claim.—1. In a plaster of the character described, the combination with a supporting-frame, of blocks secured thereto and having their under sides oppositely beveled, and covering-teeth secured to the blocks to permit their free ends to have vertical movements.

2. In a plaster of the character described, the combination with a supporting-frame, of blocks secured thereto and having their sides oppositely beveled, covering-teeth secured to the blocks to permit their free ends to have vertical movements, and means for limiting the downward movements of the covering-teeth.

3. In a plaster of the character described, the combination with a supporting-frame, of blocks secured thereto, covering-teeth secured to the blocks to permit their free ends to have vertical movements, and braces secured to the frame and provided with supporting-feet to receive the covering-teeth limiting their downward movements.

4. In a plaster of the character described, the combination with a supporting-frame, of blocks secured thereto, covering-teeth secured to the blocks to permit their free ends to have vertical movements, handles secured to the supporting-frame, and braces having their upper ends secured to the handles, and their lower ends provided with supporting-feet to receive the covering-teeth limiting their downward movements.

5. In a plaster of the character described, the combination with a supporting-frame, of a pivot-foot depending therefrom, a feed-spout provided with a pair of inwardly-extending flanges, a clamping-plate engaging said flanges, a bolt carried by the pivot-foot for holding said clamping-plate, feed-spout and pivot-foot together, blocks secured to the supporting-frame, and covering-teeth secured to the blocks to permit their free ends to have vertical movements.

6. In a plaster of the character described, the combination with a supporting-frame, of a pivot-foot carried thereby and depending therefrom, a feed-spout carried by the pivot-foot, a feed-hopper carried by the frame, a feeder arranged within said hopper, a U-shaped agitator carried by the feeder, blocks secured to the supporting-frame, and covering-teeth secured to the blocks to permit their free ends to have vertical movements.

7. In a plaster of the character described, the combination with a supporting-frame, of a pivot-foot carried thereby and depending therefrom, a feed-spout provided with a pair of inwardly-extending flanges, a clamping-plate engaging said flanges, a bolt carried by the pivot-foot for holding said clamping-plate, feed-spout, and pivot-foot together, a feed-hopper carried by the frame, a feeder arranged within the hopper, a U-shaped agitator carried by the feeder, a regulator interposed between the feed-hopper and the feed-spout, bearing-blocks secured to the supporting-frame, and having their under sides oppositely beveled, a shaft journaled on the bearing-blocks, a wheel mounted on the shaft, means for imparting motion to the feed-hopper, handles secured to the supporting-frame, covering-teeth secured to the bearing-blocks to permit their free ends to have vertical movements, and braces carried by the supporting-frame and connected to the handles, the braces being provided at their lower ends with supporting-feet to receive the covering-teeth limiting their downward movements.

702,828. METHOD OF MAKING MOSAIC WORK. JOHN S. PARKER, NEWYORK, N.Y. Filed June 26, 1901. Serial No. 85,264. (No specimens.)

Claim.—The herein-described method of making glass mosaic work and of securing uniformity of tint or coloring of the blocks, said method consisting in applying coloring-matter to one side of a sheet of glass, then

scoring the opposite sides of the sheet, the scorings on one side being at an angle to the scorings of the opposite side, then breaking up the plate into blocks in accordance with the scoring thereof, then setting up the blocks in an ornamental design in a cellular frame with the colored sides or faces underneath, then applying an adhesive sheet to the exposed faces of the block, then inverting the cellular frame and removing the same from the blocks, then applying to the back of the blocks and the spaces between them a coating or backing of cement for holding said blocks in position, and finally removing the adhesive sheet, substantially as specified.

702,829. PHOTOMETRIC RECORDER AND INDICATOR. JOSEPH POLJAKOFF, CHARLESTON, S.C. Filed July 18, 1900. Serial No. 34,078. (No model.)

Claim.—1. In combination with a set of electromagnets and an electro-magnet; a photo-electric resistance in circuit with said magnet and an indicating device operated by the latter, substantially as set forth.

2. The combination with a source of electricity and an electrically-operated indicating device; of a photo-electric resistance in circuit with said electrically-operated indicating device, and means for reducing the light passing to said resistance, substantially as set forth.

3. The combination with a source of electricity and an electrically-operated stylus arranged to trace a record; of a selenium-cell in series in the stylus-operating circuit, and a removable shutter covering said cell, substantially as set forth.

4. In combination with a source of electricity, a branch circuit, a recording instrument and a switch in said circuit, a second branch circuit, a photo-electric resistance and electrical means for operating said switch included in said second circuit, whereby current is interrupted through the first branch circuit, substantially as described.

5. In combination with a photo-electric resistance, a controlled medium arranged to reduce light admitted to said resistance, substantially as set forth.

6. In combination with a photo-electric resistance, a controlled medium arranged to send light to said resistance in decreasing intensity, substantially as set forth.

7. In combination, a selenium-cell, a controlled medium arranged to reflect light to said cell, substantially as set forth for the purpose set forth.

8. In combination, a pair of selenium-cells, a reflector arranged to concentrate light on one of said cells, and a reflector sensitive to light arranged to reflect light to the other, substantially as set forth.

9. In combination in an electric circuit, a pair of selenium-cells, a reflector of predetermined reflecting power arranged to direct light to one of said cells, and a removable controlled medium arranged to reflect light to the other, substantially as set forth.

10. In combination in an electric circuit, a pair of selenium-cells, a reflector sensitive to light and directing rays to said cells, and means for admitting light from different sources, substantially as set forth for the purpose set forth.

11. In combination, a selenium-cell, a tube admitting light to a non-variant reflector, a second reflector receiving light from the first, sensitive to light and arranged to reflect said light to the cell, substantially as set forth for the purpose set forth.

12. In a photometer, the combination with a source of electricity, of a selenium-cell and a solenoid electrically connected and a circuit-breaker operated by said solenoid, substantially as set forth.

13. In combination, a photo-electric cell, a tube admitting light to a non-variant reflector, arranged at an angle to said tube and cell to reflect light sent through the former to the latter; a second tube and photo-electric cell and a reflector sensitive to light arranged to reflect light sent through the second tube to the second cell, electrical connections, and means for indicating the relative intensity of the light, substantially as set forth.

14. In a photometer, the combination with a source of electricity, of a selenium-cell and a solenoid connected in series in one circuit, a circuit-breaker actuated by said solenoid and a recording instrument in a parallel circuit, substantially as set forth.

15. In a photometer, the combination with a source of electricity, of a pair of solenoids connected in parallel and a selenium-cell in one circuit; a circuit-breaker actuated by said solenoids and a recording device in another parallel circuit, substantially as set forth.

16. In a photometer, the combination with a source of electricity, of a pair of electromagnets, a photo-electric cell and a comparison photo-electric cell in one circuit, and a circuit-breaker operated by said magnets and electrically-operated indicating device in a branch circuit, substantially as set forth.

17. In a photometer, the combination with a source of electricity, of a pair of electromagnets, a standard and a comparison photo-electric cell in one circuit, and a contact moved by each magnet, and a suitable indicating device in a branch circuit, substantially as set forth.

18. In a photometer, the combination with a source of electricity, of a pair of solenoids each arranged to operate a spring-actuated contact, said contacts arranged to have their ends close circuit, and a standard and a comparison photo-electric cell in one circuit and said contacts, and a recording device in a branch circuit, substantially as set forth.

702,830. MAGNET HOLDING AND ADJUSTING APPARATUS FOR COMPENSATING BINNAGLES. ANDREW M. RITCHIE, BROOKLYN, N.Y. Filed Jan. 21, 1901. Serial No. 48,481. (No model.)

Claim.—1. An apparatus of the character specified, comprising a vertical standard, a plurality of magnet-holders each composed of an inner member fitted to slide without rotating on the standard, and an outer member rotatable horizontally on the inner member, means for giving each holder a vertical adjustment independently of the other, means for securing the holders in any position to which they may be vertically adjusted, and means for securing the outer members of the holders in any position to which they may be relatively adjusted.

2. An apparatus of the character specified, comprising a fixed stand-

and having a fixed elongated locking member, a magnet-holder adapted to slide vertically on said standard, a sliding locking member mounted on said holder, an adjusting device supported by the sliding locking member for vertically adjusting the magnet-holder when the sliding locking member is locked, and means for moving said sliding member and adjusting device toward and from the fixed member, the magnet-holder being free to receive a quick adjustment when said members are out of engagement with each other.

3. An apparatus of the character specified, comprising a fixed standard having a fixed elongated locking member, a magnet-holder adapted to slide vertically on said standard, a sliding locking member mounted on said holder, a vertical curve-and offset to the sliding member, an adjusting-out engaged with said standard and with horizontal guides on the magnet-holder, a horizontal adjusting-rod connected with the sliding locking member, and a nut engaged with the adjusting-rod and with vertical guides on the magnet-holder.

4. The combination of an elongated standard having an elongated locking member, a holder or carrier movable relatively to the standard, a movable locking member mounted on said holder, an adjusting device supported by the movable member, whereby the holder may be moved relatively to the movable locking member when the latter is locked, to give the holder a minute adjustment, and an adjusting-rod and a nut engaged therewith for moving the movable locking member into and out of engagement with the elongated locking member, the holder being quickly adjustable when the locking members are separated.

702,831. ADJUSTABLE ROCKING AND RECLINING CHAIR. JAMES H. ROBERTS, ANDOVER COUNTY, MA. Filed Aug. 10, 1901. Serial No. 85,204. (No model.)

Claim.—1. In an adjustable rocking and reclining chair, the combination with the frame, back and rockers, of the chair-seat, a foot-rest, a lever attached to said back near the point of its hinged connection with the seat and provided with a slot at its lower end, a bar provided with notches at one end and having pivotal connection with the lower part of said foot-rest whose upper end is hinged to the front edge of the chair-seat, of the pin across said slot adapted to engage said notches and the lever at the back of the lever to disengage the bar from said pin connection and permit the adjustment of the chair to a different angle, substantially as shown, for the purpose specified.

2. In an adjustable rocking-chair, the combination with the frame and rockers thereof, of a ratchet extending across one side of the chair, of a standard pivoted to the chair-frame and having extensions at the lower portion thereof adapted to contact with the floor, the arm of which extends near the arm of the chair, and of the pawl attached to said arm near its upper end and adapted to engage with the ratchet, the whole adapted to serve as a rocker-lock and hold the chair at any angle desired, substantially as described and for the purpose specified.

3. In an adjustable rocking-chair the combination with the frame and back thereof, of a ratchet at the side of the chair, of a standard pivoted to the chair-frame and having two feet or extensions at the lower portion thereof adapted to contact with the floor and the pawl attached to said standard and adapted to engage with said ratchet, substantially as described and for the purpose specified.

702,832. METAL TRUSS. EDWARD W. BAKER, IOWA, ILL. Filed Jan. 15, 1902. Serial No. 89,918. (No model.)

Claim.—1. A truss consisting of a tension member and a compression member, the ends of the compression member being lapped over the tension member to form joints, and said parts being suitably secured together at the joints, plates fastened to the tension and compression members, respectively, said plates having feet projecting beyond the flange of

the compression member, and struts secured to the webs of the tension and compression members respectively.

2. In a truss, tension and compression members, the webs of each being of variable depth, and the ends of the compression member overlapping the tension member and secured thereto and struts secured to the webs of the said tension and compression members.

3. In a truss, tension and compression members, the webs of each being of variable depth, and the ends of the compression member overlapping the tension member and secured thereto, struts secured to the webs of the said tension and compression members, and plates secured to the truss where the parts thereof overlap.

702,888. LOOK. MARTIN SCHAEFER, Chesham, Ohio. Filed Jan. 18, 1901. Serial No. 89,484. (No model.)

Claim.—In a lock, the combination of a casing having a cylinder immovably projecting therefrom and communicating with the interior thereof, said cylinder having an outer internal retaining flange, lock mechanism within the casing, a rotatable key-guide in the cylinder and casing and having a longitudinal slot extending the full length thereof and also provided with a slotted disk-head rotatably bearing against the inner portion of the flange of the cylinder, a key longitudinally insertible through the cylinder and key-guide, and a pull device attached to the outer extremity of the spindle and forming the sole means for securing the lock in applied position.

702,884. PUMP-PIPE GRAPPLE. LEVI N. SCHULTZ and SAMUEL H. SCHULTZ, Oregon, Mo. Filed Jan. 31, 1902. Serial No. 92,082. (No model.)

Claim.—1. In a grapple of the class described, the combination of a stock having a rigid jaw on one side, a cam-lever and a shoe-jaw pivoted to the stock, said shoe-jaw being disposed opposite the rigid jaw and adapted to bear against the cam, a bail connected to and longitudinally movable on the stock and a connection between the bail and the cam-lever, whereby the latter is operated by the bail, substantially as described.

2. In a grapple of the class described, the combination of a stock having a rigid jaw on one side and a longitudinal guide-disk, a cam-lever, and a shoe-jaw pivoted to the stock, said shoe-jaw being disposed opposite the rigid jaw and adapted to bear against the cam, a bail, a connecting element pivotally connecting the bail to the stock, said connecting

element operating in the guide-disk, and a link pivotally connected to the bail and the cam-lever, substantially as described.

3. In a grapple of the class described, the combination of a stock having a rigid jaw on one side thereof, the said rigid jaw having a lateral extension disposed opposite one side of the stock, a cam-lever and a shoe-jaw pivoted to the stock, said shoe-jaw being disposed opposite the lateral extension of the rigid jaw and adapted to bear against the cam, a bail connected to and longitudinally movable on the stock, and a connection between the bail and the cam-lever, whereby the latter may be operated to operate the shoe-jaw, substantially as described.

702,885. GRAIN-BINDER. JAMES L. WARE, St. Paul, Minn. Filed Sept. 7, 1900. Renewed May 2, 1902. Serial No. 106,004. (No model.)

Claim.—1. In a grain-binder employing a clip-former, a die composed of separable sections and means for separating the same, in combination with a driving device for forcing the clip-forming material into said die when the sections are closed.

2. In a grain-binder employing a clip-former, the combination with a die composed of separable sections, of automatic means for locating the ends of the band between said die-sections, means for forcing the clip within said die and around the ends of the band, and automatic mechanism for separating the die-sections to afford clearance for the discharge of the formed clip.

3. In a grain-binder employing a clip-former, the combination with a die composed of separable sections arranged to form a clip-forming throat with tangential entrance-passages for the clip-forming material, with automatic means for locating the ends of the band within the throat of said die, a driving device for forcing the clip-forming material through said entrance-passages into the throat and around the ends of said band, and automatic mechanism for separating the die-sections to afford clearance for the discharge of the formed clip.

4. In a grain-binder employing a clip-former, the combination with a die composed of separable sections arranged to form a clip-forming throat with tangential entrance-passages for the clip material, of automatic devices for locating the ends of the band within the throat of said die, a driving device operating to force the clip-forming material into the throat of said die and around the ends of said band and by a continued movement to link and press the same onto said band, and automatic mechanism for separating the die-sections.

5. In a grain-binder employing a clip-former, the combination with a banking-carriage against which the clip-forming material is pressed, of a die composed of separable sections arranged to form a clip-forming throat and receiving from said banking-carriage, a driver mounted to move at an angle to said banking-carriage whereby the nose of said driver is given an increasing projection from said banking-carriage in the driving action thereby insuring the engagement of the blank and giving an increasing hold while forming the clip, and means for separating the die-sections, substantially as described.

6. In a grain-binder employing a clip-former, the combination with a banking-carriage against which the clip-forming material is pressed, of a die composed of separable sections arranged to form a clip-forming throat and receiving from said banking-carriage, a driver mounted to move at an angle to said banking-carriage for the purpose of blank, said driver having a projecting beveled driving-rod and an extended linking edge, and means for separating the die-sections, substantially as described.

7. In a grain-binder employing a clip-former, the combination with a die composed of separable sections arranged to form a clip-forming throat with a tangential entrance thereto, of a clip-driver mounted to move

transversely of and into the clip-forming throat of said die, the said driver having a projecting beveled driving-rod and an extended linking edge for action on the clip, and means for separating the die-sections, substantially as described.

8. In a grain-binder employing a clip-former, the combination with a banking-carriage against which the clip-blanks are delivered laterally, of a die having a clip-forming throat, receiving from said banking-carriage, a blank-driver, and an adjustable guide-plate for said blank-driver, having a guiding-carriage extending at an angle to said banking-carriage, whereby said plate may be adjusted to take up the wear and preserve the proper position of said guide-carriage, substantially as described.

9. In a grain-binder employing a clip-former, the combination with a magazine for the clip-blanks, of a banking-carriage against which the blanks are delivered laterally from said magazine, a die having a clip-forming throat receiving from said banking-carriage, a blank-driver, and an adjustable guide-plate for said blank-driver, having its guiding-carriage extending at an angle to said banking-carriage, whereby said guide-plate may be adjusted to take up the wear and preserve the proper position of the guiding-carriage, substantially as described.

10. In a grain-binder employing a clip-former, the combination with a divided separable die having a clip-forming throat with an entrance for the clip-forming material, of connections for moving one of the die-sections with respect to the other, involving a yielding part, and a driver movable transversely of and into the clip-forming throat of said die, in the clip-forming action, said parts operating substantially as described.

11. The combination with a divided separable die having a clip-forming throat with an entrance-passages, one of the die-sections having laterally-extended spring jaws or plates, for the purpose of blank, and a driver mounted to move transversely of and into the clip-forming throat of said die, substantially as described.

12. In a grain-binder employing a clip-former, the combination with a die composed of separable sections arranged to form a clip-forming throat with an entrance-passages, of connections for moving one of said die-sections with respect to the other, comprising an actuating lever with a spring-arm or yielding part, and automatic mechanism for imparting positive and predetermined movement to the motion-receiving end of said lever whereby breaking or straining of the parts in the die-closing action is prevented.

13. In a grain-binder employing a clip-former, the combination with a die having a clip-forming throat, of a banking-carriage against which the clip-blanks are delivered laterally, a blank-driver, an adjustable guide-plate having a guiding-carriage against which said driver is mounted to move, and a cam or eccentric operating as a stop to said guide-plate, substantially as described.

14. In a grain-binder employing a clip-former, the combination with a die formed in separable sections and provided with a clip-forming throat, of means for moving one of the die-sections with respect to the other, comprising a reciprocating part carrying a clip-forming finger extending from the throat-section of the movable die member, and a driver for forcing the material from which the clips are to be formed, into the throat of said die, substantially as described.

15. In a grain-binder employing a clip-former, the combination with a divided die having a clip-forming throat, of means for moving one of the die-sections with respect to the other, comprising a reciprocating part carrying a cord-leading finger extending from the throat-section of the movable die member, a pivoted tucker cooperating with said finger and actuated by or with the movable die member, and a driver for forcing the material from which the clips are to be formed, into the throat of said die, substantially as described.

16. In a grain-binder employing a clip-former, the combination with a die composed of separable sections, each of said sections having cooperating approximately complementary notches forming a clip-forming throat, of cheek-plates having cord-leading notches and arranged to hold the cord or band clear of the walls of said throat when said die-sections are in closed relation, and means for locating the ends of the cord within the notches of said cheek-plates.

17. In a grain-binder employing a clip-former, the combination with a die composed of separable sections, said die-sections having cooperating approximately complementary notches forming a clip-forming throat, of cheek-plates having cord-leading notches extending approximately concentric with said throat-forming notches when said die-sections are in closed relation, and arranged to hold the cord or band clear of the walls of said throat, one of said cheek-plates having a projected cord-leading finger extended tangentially in the cord-leading notch thereof.

702,886. FITTING FOR STEAM-HEATING SYSTEMS. CHARLES A. HALL, Washington, D. C. Filed Mar. 3, 1902. Serial No. 98,967. (No model.)

Claim.—1. A fitting for steam-heating systems, consisting of a casing adapted to communicate with the radiator and return sides of the system, and a valve in said casing for establishing either direct communication

therethrough for cleaning or throwing out, or indirect communication for relief of entrained air and water of condensation.

2. A fitting for steam-heating systems, consisting of a casing adapted to communicate with the radiator and return sides of the system, and a valve in said casing for establishing either direct communication therethrough for cleaning or blowing out, or indirect and adjustable communication for relief of entrained air and water of condensation.

3. A fitting for steam-heating systems, consisting of a casing having an outlet, a partition therein dividing said casing into two chambers, one adapted to communicate with the radiator side of the system, means for affording relief of entrained air and water of condensation from the chamber on the radiator side to the other chamber, and a valve adapted to establish either direct communication between the chamber on the radiator side and the outlet or between the other chamber and the outlet.

4. A fitting for steam-heating systems, consisting of a casing having an outlet, a partition therein dividing said casing into two chambers, one adapted to communicate with the radiator side of the system, means for affording communication between said chambers, and a valve in said partition controllable from the exterior and adapted to establish either direct communication between the chamber on the radiator side and the outlet or between the other chamber and the outlet.

5. A fitting for steam-heating systems, consisting of a casing having an outlet and divided into two chambers, one adapted to communicate with the radiator side and the other normally with the outlet, and a substantially vertical pipe communicating between the two chambers for permitting the relief of entrained air and water of condensation from the chamber on the radiator side to the other chamber in an upward direction only.

6. A fitting for steam-heating systems, consisting of a casing having an outlet, a partition therein dividing said casing into two chambers, one adapted to communicate with the radiator side of the system, said partition having ports opening from each chamber into the outlet, a valve for controllably opening either of said ports or closing both of them, and means for affording communication between said chambers.

7. A fitting for steam-heating systems, consisting of a casing having an outlet, a partition therein dividing said casing into two chambers, one adapted to communicate with the radiator side of the system, said partition having ports opening from each chamber into the outlet, a valve for controllably opening either of said ports or closing both of them, and a pipe communicating between the two chambers for permitting relief of entrained air and water of condensation from the chamber on the radiator side to the other chamber in an upward direction only.

8. A fitting for steam-heating systems, consisting of a casing having an outlet, a partition dividing said casing into two chambers, one adapted to communicate with the radiator side and the other normally with the outlet, a substantially vertical pipe communicating between said chambers and projecting at its lower end into the chamber on the radiator side to a point above the bottom of said chamber, and a check-valve in said pipe permitting passage therethrough from the radiator side to the outlet side only.

702,887. BRAKE MECHANISM FOR CYCLES, MOTOR-CARS, &c. GEORGE E. BARNETT, Oroyden, England. Filed Mar. 10, 1902. Serial No. 97,989. (No model.)

Claim.—1. A brake, comprising in combination, a suitably fulcrumed operating-lever, an adjustably fulcrumed power-distributing rod, an operating part in proximity to each wheel, a connection extending from the opposite ends of said adjustably fulcrumed power-distributing rod to the operating parts and means for adjusting the fulcrum relatively to the opposite ends of said power-distributing rod, substantially as described.

2. A brake comprising, in combination, a lever, hinged upon one end, a tubular part supported by said lever, a rod adjustably fulcrumed to said tubular part, means serving to adjust said tubular part and the supported fulcrum of the rod relatively to said rod, an operating part in prox-

larity to each wheel, and a connection extending from each operated part to opposite ends of said rod, substantially as described.

3. The combination of a bifurcated tubular guide whose legs straddle the wheel-rim, and which are provided with guideways at their ends, brake-blocks sliding in said guideways; springs for disengaging the brakes from the wheel, and flexible connections which pass through the tubular guide to the brake-block slides, substantially as described.

4. A brake comprising, in combination, a lever, brackets upon said lever, a tubular part supported by said brackets, a rod adjustably fulcrumed to said tubular part, means serving to adjust said tubular part and the supported fulcrum of the rod relatively to said rod, a brake-stirrup consisting of a bifurcated tubular guide in proximity to each wheel, a slide-guideway at the extremity of each of said stirrup-legs, slides located in each guideway, bifurcated connections extending from the opposite ends of said adjustably-fulcrumed rod to the said slides, and brake-blocks pivoted to said slides, substantially as described.

702,888. PAPER-HANGER'S TOOL. THOMAS E. BOER, Cincinnati, Pa. Filed Nov. 13, 1901. Serial No. 68,001. (No model.)

Claim.—1. In a device of the character described, the combination with a handle having at one end a brush-scurring device comprising a forked extension and a curved spring; of a socketed brush adapted to fit on the forked extension and provided with a lateral groove adapted to be engaged by said spring to normally hold the brush in engagement with the handle.

2. In a device of the character described, the combination with a handle having at one end a brush-scurring device comprising a forked extension and a curved spring; of a socketed brush adapted to fit on the forked extension and provided with a lateral groove adapted to be engaged by said spring to normally hold the brush in engagement with the handle, a sleeve on said handle and a laterally-arranged roller carried by said sleeve.

3. In a device of the character described, the combination with a telescopic handle having at one end a brush-scurring device comprising a forked extension and a curved spring; of a socketed brush adapted to fit on the forked extension and provided with a lateral groove adapted to be engaged by said spring to normally hold the brush in engagement with the handle.

4. In a device of the character described, the combination with a

handle having at one end a brush-scurring device comprising a forked extension and a curved spring; of a socketed brush adapted to fit on the forked extension and provided with a lateral groove adapted to be engaged by said spring to normally hold the brush in engagement with the handle, a tubular extension on one end of said handle, a plug inserted therein, and a removable hand-roller secured to said plug.

702,889. TELEGRAPHIC APPARATUS. RICHARD G. BROWN, Pat-
ent, England. Original application filed Mar. 20, 1900, Serial No. 10,666.
Divided and this application filed Jan. 30, 1901. Serial No. 66,284. (No
model.)

Claim.—1. An electric-telegraph apparatus, comprising constantly-rotating spindles, clutch-collars fixed to said spindles, clutch-slides mounted on said spindles, means for moving the clutch-slides along the spindles out of gear with the clutch-collars once during every revolution of the clutch, means operated by the clutch-slides for punching signaling-perforations in the tape, means for normally holding the clutch-slides out of gear with the clutch-collars, and means for releasing the clutch-slides when signaling-perforations are to be punched, substantially as described.

2. In an electric-telegraph apparatus, the combination of punches for perforating signals in a tape, a punch for perforating spaces in a tape, means operated by received signals from a line or cable circuit for actuating said punches, and means for limiting the length of blank tape perforated by the spacing-punch when no signals are received, substantially as described.

3. Electric-telegraph apparatus comprising constantly-rotating spindles, clutch-slides adapted to be moved lengthwise of said spindles, means operated by signals received from a cable or line which normally engage and hold said clutch-slides stationary but release the said-slides when signaling-currents are received, means for moving the clutch-slides into engagement with the rotary spindles when thus released, means operated by said clutch-slides for punching perforations in a signaling-tape, and means for limiting the length of blank tape passed through the apparatus after the cessation of signals, substantially as described.

4. Electric-telegraph apparatus comprising constantly-rotating spindles, clutch-collars fixed to said spindles, clutch-slides mounted on said spindles, cams carried by said clutch-slides, pins projecting laterally from said clutch-slides, means arranged in the path of said lateral pins and adapted to lift the clutch-slides out of gear with the clutch-collars during part of the revolution of the clutch-slides, means operated by said pins for punching signaling-perforations in a tape, means engaging with the lateral pins for normally holding the clutch-slides out of gear with the spindles and means for releasing the lateral pins when signaling-perforations are to be punched, substantially as described.

5. Electric-telegraph apparatus comprising constantly-rotating spindles, clutch-collars fixed to said spindles, clutch-slides mounted loosely on said spindles, cams carried by the clutch-slides, springs which tend to throw the clutch-slides into gear with the clutch-collars, pins projecting laterally from the clutch-slides, rollers arranged in the path of the

lateral pins and adapted to lift the clutch-slides out of gear with the clutch-collars during part of the revolution of the clutch, means operated by the pins for punching signaling-perforations in a tape, means for normally engaging the lateral pins for holding the clutch-slides out of gear with the clutch-collars, and means for releasing the lateral pins for punching perforations in a tape, substantially as described.

6. Electric-telegraph apparatus comprising constantly-rotating spindles, clutch-collars fixed to said spindles, clutch-slides mounted loosely on said spindles, cams carried by the clutch-slides, springs which tend to throw the clutch-slides into gear with the clutch-collars, pins projecting laterally from the clutch-slides, rollers arranged in the path of the lateral pins and adapted to lift the clutch-slides out of gear with the clutch-collars during part of the revolution of the clutch, means operated by the pins for punching perforations in the tape, means for normally engaging with the lateral pins so as to hold the clutch-slides out of gear with the clutch-collars, and electromagnets adapted to be energized and to move the armatures so as to release the lateral pins to receive received signals, substantially as described.

7. Electric-telegraph apparatus comprising three constantly-rotating spindles, clutch-slides mounted on said spindles, cams on said clutch-slides, strikers operated by said cams two of which strikers are adapted to operate lateral punches for perforating lateral signaling-holes and also a central punch for perforating central holes in a tape, and the third of which punches is adapted to operate the clutch-slides for operating the lateral punches out of gear with their rotary spindles, means for throwing the clutch-slides for separately operating the central punch out of gear after the cessation of signals and when a definite length of tape has passed through the apparatus and means for throwing the clutch-slides for operating the lateral punches into gear with their spindles for perforating signals, substantially as described.

8. Electric-telegraph apparatus comprising three constantly-rotating spindles, clutch-slides mounted on said spindles, cams on said clutch-slides, strikers operated by said cams two of which strikers are adapted to operate lateral punches for perforating lateral signaling-holes and also to simultaneously operate a central punch for perforating central holes in a tape, and the third of which strikers is adapted to operate the central punch only, means for normally holding the clutch-slides for operating the lateral punches out of gear with their rotary spindles, a stop operated by pawl and ratchet-wheel gear for throwing the clutch-slides for separately operating the central punch out of gear when a definite length of tape has passed through the apparatus after the cessation of signals, means for releasing the clutches for operating the lateral punches and for simultaneously releasing the pawls and permitting the said stop and ratchet-wheel to return to zero, and means for holding the clutch-slides for separately operating the central punch out of gear when the clutch-slides for operating the lateral punches are in action, substantially as described.

9. Electric-telegraph apparatus comprising three constantly-rotating spindles, clutch-collars fixed to said spindles, clutch-slides mounted loosely on said spindles, cams carried by the clutch-slides, springs which tend to throw the clutch-slides into gear with the clutch-collars, pins projecting laterally from the clutch-slides, rollers arranged in the path of the lateral pins and adapted to lift the clutch-slides out of gear with the lateral pins and adapted to lift the clutch-slides out of gear with the clutch-collars during part of the revolution of the clutch, strikers operated by said cams two of which strikers are adapted to operate lateral punches for perforating lateral signaling-holes and also to simultaneously operate a central punch for perforating central holes in a tape, and the third of which strikers is adapted to operate the central punch only, means for normally engaging the lateral pins of and holding out of gear the clutch-slides which operate both the lateral and central punches, means for engaging the lateral pins of and holding out of gear the clutch-slides which operate the central punch when a definite length of tape has passed through the apparatus after the cessation of signals, means for releasing the clutch-slides which operate the lateral punches, and means for simultaneously engaging the lateral pins of and holding out of gear the clutch-slides which operate the central punch, substantially as described.

10. In electric-telegraph apparatus the combination of three constantly-rotating spindles, clutch-collars fixed to said spindles, clutch-slides mounted loosely on said spindles, cams carried by the clutch-slides, springs which tend to throw the clutch-slides into gear with the clutch-collars, pins projecting laterally from the clutch-slides, rollers arranged in the path of the lateral pins and adapted to lift the clutch-slides out of gear with the clutch-collars during part of the revolution of the clutch, strikers operated by said cams two of which strikers are adapted to operate lateral punches for perforating lateral signaling-holes and also to simultaneously operate a central punch for perforating central holes in a tape, and the third of which punches is adapted to operate the central punch only, means for normally engaging the lateral pins of and holding out of gear the clutch-slides which operate both the lateral and central punches, a lever carrying a projection adapted to be moved into the path

of the lateral pin on the clutch-slides adapted to operate the central punch, a ratchet-wheel, spring-pawl adapted to rotate said ratchet-wheel by a step-by-step movement against the pressure of a spring, a pin carried by said ratchet-wheel, means operated by said central clutch-slides for operating the said pawl at every revolution of said slide, whereby the pin carried by the ratchet-wheel is caused to strike the lever carrying the projection and thus move said projection into the path of the lateral pin of the central clutch-slide after the central clutch-slide has made a definite number of revolutions, means for releasing the clutch-slides which operate the lateral punches when signaling-perforations are to be punched in the tape, and means operated by said lateral clutch-slides when thus released for releasing the pawls from the ratchet-wheel so as to permit said ratchet-wheel to return to zero under the influence of its spring, and means operated by the lateral clutch-slides when released for operating the lever carrying the projection so as to move said projection into the path of the lateral pin on the central clutch-slide, substantially as described.

702,840. MACHINE FOR MAKING CUSHIONS. GEORGE BOW-
MAN, Burlington, N. J. Filed Apr. 10, 1901. Serial No. 64,922. (No
model.)

Claim.—1. The combination in a cushion-making machine, of a supporting frame, pressing device, and a sliding carriage and yielding bearings therefor, substantially as set forth.

2. The combination with the sliding carriage of a cushion-making machine, of a table supported thereby, rails upon which said carriage runs, and yielding bearings for said rails, substantially as set forth.

3. The combination with the frame of a cushion-making machine, of recessed beams, rails fitted to the recesses in said beams, springs supporting the rails, and a sliding carriage provided with wheels resting upon the rails, substantially as set forth.

4. The combination in a cushion-making machine, of a supporting frame, pressing device, a movable carriage, yielding bearings for the carriage, and a fixed bearing to be engaged by the carriage when the yielding bearings are depressed, substantially as set forth.

5. The combination of the carriage 6, yielding supports therefor, a table 7 pivoted to said carriage, pressing device, and a support 8 in position to be engaged by the middle portion of the carriage when the latter is depressed, substantially as set forth.

6. The combination of the carriage 6 and yielding supports therefor, and a table 7 pivoted to said carriage and pressing device, substantially as set forth.

7. The combination with the frame, the table, and the follower-board, of a cushion-making machine, of a movable presser-beam, and adjustable blades carried by the said beam, substantially as set forth.

8. The combination of the frame, the table, the follower-board, the presser-beam provided with slots 9, and the blades 1 provided with bolts extending through the slots and with nuts bearing upon the presser-beam, substantially as set forth.

702,841. PLANING-MACHINE. WILSON W. CARR, Lowell, Mass.
Filed Dec. 17, 1901. Serial No. 66,281. (No model.)

Claim.—1. In a beam or hand planing-machine, the combination of back and front tables, a cutter-carrying head-stock of yoke form, the transverse portion of which is adapted to bear flatwise against the framework of the machine, and each framework having elongated vertical slots, curves adapted to pass through the respective slots, and the transverse portion of the head-stock having tapered ends to receive said curves, and said

head-stock having legs at its opposite ends, and the framework having co-operating legs arranged in vertical alignment with the other legs, and independent adjusting means connected with the respective legs.

2. In a beam or head plating-machine, the combination of beam and front tables, a cutter-carrying head-stock of yoke form, the transverse portion of which is adapted to bear flatwise against the framework of the machine, and each framework having elongated vertical slots, curves adapted to pass through the respective slots, and the transverse portion of the head-stock having tapered ends to receive said curves, and said head-stock having legs arranged in vertical alignment with the other legs, and right and left headed adjusting-screws tapped into the respective legs.

702,842. VALVE-ACTUATING MECHANISM FOR RADIATORS. WILLIAM F. CLARK, Everett, Mass., assignor of two-thirds to Gustavus Cooper, Cambridge, Mass., and Almon Coleman, Boston, Mass. Filed Oct. 3, 1901. Serial No. 77,574. (No model.)

Claim.—1. A radiator provided with a valve having a rotatable spindle, provided with a usual hand-wheel connection for operating the valve, a pinion interengageable with said hand-wheel, means for securing the pinion detachably to said connection, a bracket detachably mounted on and supported by the valve-rod and provided with a shaft-bearing, a manually-operated actuating-shaft supported to rotate in said shaft-bearing and held from longitudinal movement, said shaft having a gear in mesh with the said pinion on the valve-spindle, and a second bearing for the shaft secured to the upper part of the radiator, rotation of the shaft acting through the gear and pinion to operate the valve.

2. A radiator provided with a valve having a rotatable spindle, provided with a usual hand-wheel connection for operating the valve, a pinion interengageable with said hand-wheel, means for securing the pinion detachably to said connection, a bracket detachably mounted on and supported by the valve-rod, said bracket being provided with a shaft-bearing, a manually-operated actuating-shaft supported at its lower end by and to rotate in said bearing and held from longitudinal movement, a gear carried by said shaft in mesh with the pinion on the valve-spindle, a second bearing for the shaft secured to the upper part of the radiator, rotation of the shaft acting through the gear and pinion to operate the valve, and a housing carried by the bracket and including the gear and pinion.

3. A radiator and its controlling-valve having a rotatable spindle having at its end a usual hand-wheel connection, a wide-faced pinion rigidly but detachably secured at the end of the spindle to said connection, a bracket having a shaft-bearing, means to detachably secure the bracket to the gland of the valve-rod, a manually-operated upright actuating-shaft supported at its lower end in said bearing and carrying a gear in mesh with the wide-faced pinion, means to prevent longitudinal movement of the gear with respect to the wide-faced pinion and a second shaft-bearing secured to the top of the radiator to maintain the shaft in upright position.

4. A radiator-valve-actuating mechanism adapted to be detachably secured to the stem of any usual radiator-valve and comprising a bracket having a notched portion to receive the top of the valve-gland, means for securing the bracket by its notched portion to said gland to support the same and parts carried thereby, a pinion adapted for detachable engagement with the valve-stem, said bracket having a shaft-bearing, an upright shaft mounted at its lower end in said bearing, a gear fixed on said shaft and adapted to mesh with said pinion on the valve-stem.

5. A radiator and its controlling-valve having an upright rotatable spindle at the base of the radiator, a wide-faced pinion fixed on the spindle, a bracket having a notch to embrace the spindle-gland and opened to receive the spindle, a shaft-bearing on the bracket, an upright shaft mounted at its lower end in said bearing and having a gear thereon in mesh with and to rotate the pinion, means to prevent longitudinal movement of said shaft, a second bearing for the shaft, mounted on the upper part of the radiator, a housing on the upper end of shaft to rotate it, and a protective housing for the gearing, mounted on the bracket, said housing being open at its bottom to permit the ready attachment of the pinion to the top of the valve-stem.

702,848. COMMON RANGES AND WATER-HEATER. HARRIS and W. CONNOR, Boston, Mass. Filed Jan. 31, 1902. Serial No. 62,312. (No model.)

Claim.—1. A combined cooking-stove and water-heater having a top or support for stands, a water-chamber separated therefrom by a space or passage for the gases, upper and lower grates arranged in a tier, the lower grate being in direct heating relation to the walls of said chamber and the space which said grates occupy having an outlet to said passage, and a third grate positioned to one side of said grates and in heating relation to said chamber, the space which it occupies having a separate outlet for gases.

2. A combined cooking-stove and water-heater having a top or support for stands, a water-chamber separated therefrom by a space or passage for the gases, upper and lower grates arranged in a tier, the lower grate being in direct heating relation to the walls of said chamber and the space which said grates occupy having an outlet to said passage, a refractory lining forming the walls of said space above the upper grate, and a third grate positioned to one side of said grates and in heating relation to said chamber, the space which it occupies having a separate outlet for gases.

702,844. CORE-BUCKER AND FODDER-SHREDDER. JOHN CHERRY, Modesto, Minn. Filed July 13, 1901. Serial No. 65,947. (No model.)

Claim.—1. In a machine of the class described, the combination of a shredding mechanism, snapping-rolls which feed the mass, backing-rolls, a feed-pan into which shelled grains of corn are dropped from said backing-rolls, a feed-pan 35 into which the ear-corn is dropped from said backing-rolls, a stacker-tube and a blower to exhaust through the casing of the machine over said feed-pans and discharge a blast through the said stacker-tube, whereby the shelled fodder is pneumatically discharged from the machine and the shelled and husked corn is cleaned, substantially as described.

2. In a machine of the class described, the combination of a shredding mechanism, snapping-rolls which feed the mass, backing-rolls below said snapping-rolls, a feed-pan into which shelled grains of corn are dropped from said backing-rolls, said feed-pan having openings to discharge said grains, a feed-pan 35 below the first-mentioned feed-pan and into which ear-corn is dropped from said backing-rolls, and a pneumatic stacker for the shelled fodder, said pneumatic stacker including a drum having an intake opposite the discharge end of said pan, and a fan in said drum, to create an exhaust-current over said feed-pans and thereby clean said grains and ear-corn, and carry off the hullings from said feed-

pass, together with the shredded fodder, through said stacker, substantially as described.

3. The combination of a pair of snapping-rolls, means to rotate one of said rolls, gears on said rolls at one end thereof, a pair of intermeshed gears 13, 25, meshed respectively with the gears on said snapping-rolls, a link connecting the axle of said gear 13, 25, together, links connecting the said axle respectively to the axle of said snapping-rolls, supports, forming bearings for the latter, rods connecting said supports at the ends of said rolls, said rods being free to play laterally in said supports, and springs on said rods to press said snapping-rolls together, said rods having means to adjust them longitudinally and thereby vary the tension of said springs, substantially as described.

4. The combination of a snapping-roll, bearings at the ends thereof, a yoke-bar connecting said bearings, and an element at the center of said yoke-bar bearing frictionally on the center of said snapping-roll, said element and said yoke-bar forming a truss to sustain the central portion of said snapping-roll, substantially as described.

5. The combination of a snapping-roll, bearings at the ends thereof, a yoke-bar connecting said bearings and an element at the center of said yoke-bar bearing frictionally on the center of said snapping-roll, said element and said yoke-bar forming a truss to sustain the central portion of said snapping-roll, and means to lubricate said element, substantially as described.

702,845. THRESHING-MACHINE. ROWLAND DAVIS, Utica, Wis. Filed Sept. 23, 1900. Serial No. 36,774. (No model.)

Claim.—1. In a hand-cutter and feeder, the combination with the framework of a threshing-machine, of a plurality of cutter-bars mounted therein, a rock-shaft near one end thereof, rods extending parallel with said shaft, means connecting said rods with said cutter-bars, and means pivotally supporting the free end of said cutter-bars, substantially as described.

2. In a hand-cutter and feeder, the combination with the framework of a threshing-machine, of a crank-shaft carried thereby, a plurality of cutter-bars pivoted to said crank-shaft, a rock-shaft mounted in said framework, laterally-extending arms carried by said rock-shaft, rods parallel with said shaft, connecting said arms, means connecting said rods with said cutter-bars, means for rotating said crank-shaft, and means for controlling said rock-shaft in unison with said crank-shaft, substantially as described.

3. In a hand-cutter and feeder, the combination with the framework of a threshing-machine, of a crank-shaft carried thereby, a plurality of cutter-bars carried by the crank of said shaft, a rock-shaft in the rear of said crank-shaft and provided with a crank, a pinion connecting a crank on the crank-shaft with the crank of the rock-shaft, laterally-extending

arms carried by said rock-shaft, rods extending parallel to said rock-shaft and secured to said laterally-extending arms, alternate pairs of links connecting the opposite parallel rods with alternate bars carried by said crank-shaft, and fingers extending rearwardly and downwardly from said last-mentioned bars, substantially as described.

4. In a hand-cutter and feeder, the combination with the sliding of a threshing-machine, of a plurality of parallel bars pivotally supported at their front ends, a rock-shaft near the rear ends thereof, means for controlling said rock-shaft, means connecting said rock-shaft to said parallel bars, downwardly-extending fingers carried by each of said bars, movable bearings supporting said rock-shaft in said sliding, a rod connected to each of said bearings, an operating-lever connected with said rod, and means for retaining said lever in a given position, substantially as described.

702,846. LOOM SHIPPER MECHANISM. CHARLES M. DAY, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed Dec. 26, 1901. Serial No. 57,180. (No model.)

Claim.—1. In a loom, actuating means, including a clutch, a shipper operatively connected therewith, a device to hold the shipper in running position, and means to normally compel a definite movement thereof beyond such position as a prerequisite to engagement with the holding device, to insure complete and rapid initial action of the clutch.

2. In a loom, actuating means, including a clutch, a shipper operatively connected therewith, a device to hold the shipper in running position, and means to normally compel a definite movement thereof beyond such position as a prerequisite to engagement with the holding device, and to thereafter permit limited retrograde movement of the shipper to running position, for the purpose set forth.

3. In a loom, actuating means, including a clutch, a shipper operatively connected therewith, a notched holding-plate for the shipper, and means to normally compel a definite movement of the latter beyond its running position prior to engagement with the notched holding device, so thereby insure effective and rapid initial action of the actuating means when the clutch is set.

4. In a loam, actuating means, including a clutch, a shipper operatively connected therewith, a device to hold the shipper in running position, and means to the shipper to normally compel a definite movement thereof beyond such running position as a prerequisite to engagement with the holding device.

5. In a loam, actuating means, including a clutch, a shipper operatively connected therewith, a device to hold the shipper in running position, and a movable dog on the holding side of the shipper normally leaving a clearance between them, whereby movement of the shipper to start the loam must be extended sufficiently to permit engagement of the dog with the holding device, to effect complete and quick initial action of the clutch, retrogression of the shipper to running position being permitted by the clearance, to relieve the operative connection between the clutch and shipper from undue friction.

6. In a loam, actuating means, including a clutch, a shipper operatively connected therewith, a notched holding-plate for the shipper, and a gravity-controlled dog on the holding side of the shipper, normally swung out to leave a clearance between it and the shipper, whereby movement of the shipper to start the loam must be extended sufficiently to permit entrance of the dog into the holding-notch, to effect complete and rapid initial action of the clutch, the clearance permitting an equal retrograde movement of the shipper to running position thereafter, to relieve the operative connection between the clutch and shipper from undue friction.

702,847. FEEDING MECHANISM FOR CONVEYERS. JAMES H. DODGE and ARTHUR D. SHAW, Philadelphia, Pa., assignors to the Link Belt Engineering Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Dec. 12, 1900. Serial No. 26,708. (No model.)

Claim.—1. The combination of a conveyor, two hoppers mounted above the conveyor, a positively-driven discharge device for each hopper mounted clear of the conveyor, and means for operating the discharge device in unison so as to feed a certain proportion of material from each hopper into the conveyor and thereby mixing the same, substantially as described.

2. The combination of an endless bucket conveyor, two hoppers mounted above the conveyor and a positively-driven reciprocating discharge device for each hopper, and means for reciprocating the discharge device in unison, whereby each bucket is supplied with material from both hoppers and said material is thereby mixed, substantially as described.

3. The combination of a conveyor, two hoppers mounted above the conveyor, a discharge-carriage for each hopper arranged as to discharge the material from the hopper into the conveyor, means for operating the

mid carriage, and means for adjusting the operating mechanism so that the proportion of material discharged into the conveyor from each hopper can be varied to make the proper mixture, substantially as described.

4. The combination of a conveyor, two hoppers, two independent discharge-carriages, one carriage controlling the flow of material from one hopper and the other carriage controlling the flow of material from the other hopper, a lever, means for vibrating said lever, and means whereby the two carriages may be independently connected to the lever, substantially as described.

5. The combination of a conveyor, two hoppers mounted above the conveyor, a reciprocating carriage mounted between each hopper and the conveyor, two levers, means for vibrating said levers, an adjustable block on each lever, a rod connecting the block on one lever with one carriage and the block on the other lever with the other carriage, and means for adjusting said blocks to regulate the extent of movement of each carriage, substantially as described.

6. The combination of a conveyor, a hopper, a reciprocating carriage mounted between the hopper and the conveyor, a pivoted lever, means for vibrating said lever, a block, a screw for adjusting said block, means for turning said screw, and a rod connecting the block with the carriage, substantially as described.

7. The combination of a conveyor, a hopper, a reciprocating discharge-carriage for the hopper, a pivoted lever, means for moving the said lever, an adjustable block on said lever, a rod connecting the block with the carriage, a screw for adjusting the block, a shaft at the pivot-point of the lever geared to the screw, and means for turning the shaft to move the block to or from the pivot-point of the lever to alter the movement of the carriage, substantially as described.

702,848. DOOR SLIDE OR GUIDE FOR FURNITURE. FRANK L. FORTNER, Shelbyville, Ind., assignor of one-half to Jacob A. Conroy, Harry Conroy, and Albert H. Schroth, Shelbyville, Ind. Filed Jan. 10, 1902. Serial No. 28,167. (No model.)

Claim.—1. In combination with a case having a rod which is maintained parallel with and in proximity to the under side of the top, a vertically-swinging and horizontally-sliding door, and a jointed coupling which is pivotally attached to the door at one end and the other end being held in slidable engagement with the rod, substantially as shown.

2. In combination with a case having a guide-rod maintained within the case to be parallel with and in proximity to the under side of the top of the case, a vertically-swinging and horizontally-sliding door, and connected links which engage the door and guide-rod.

3. In combination with a case having a rod attached to the center to be maintained parallel and in proximity to the under side of the top, of a door, a plurality of connected links one of the end links being in slidable engagement with the rod, the other end link being attached to the door, substantially as shown.

4. The combination is a sectional case, of a top thereof having a recess adjacent and parallel to its front edge, pins which project from the ends and pins being below the recess, a central guide-rod maintained parallel with the top of the case, a vertically-swinging and horizontally-sliding door having hooks for engagement with the pins, and links which connect the door to the guide-rod, substantially as shown.

5. In a case having top, bottom, and end side walls, a vertically-swinging and horizontally-sliding door for the front thereof, a centrally-disposed rod carried by the case in close proximity and parallel to the top thereof, means for movably connecting the door to the rod, hooks attached to the door, and pins which project inward from the ends of the case near its front to be engaged by the hooks when the door is closed and by the under side of the door when it is open, substantially as shown.

6. The combination is a case, of a horizontally-sliding and vertically-swinging door, a guide-rod attached to the upper portion of the case on its under side, a recess in the under side of the top of the case parallel with and adjacent to its front edge, and a jointed coupling in slidable engagement with the rod and pivotal engagement with the door the point of attachment being on the lower side of the door and below its upper edge, substantially as shown.

7. In a case which is open on one side and provided with a recess in the under side of the top adjacent to its front edge, a rod having at its front an angular portion the upper end of which engages the top rear of the recess therein, means for supporting the rod at its rear end, a horizontally-sliding and vertically-swinging door, flexible connections between the

door and rod one end of said connections being attached to the door to be low in upper edge, substantially as shown.

8. A door connected to a case to slide horizontally therein and to be swung vertically to close the open end of the case, in combination with jointed and swinging connecting means attached pivotally at one end to the door below its upper edge when closed, a rod carried by the case which is controlled by one of the end portions of the connecting means, and a top for the case having a recess beyond the front end of the rod into which recess the upper edge of the door swings when its position is being changed from horizontal to vertical.

702,849. FLUID-OUTTER ATTACHMENT. IRVING C. HENR, Minneapolis, Minn. Filed Feb. 2, 1901. Serial No. 66,473. (No model.)

Claim.—1. The combination, of a sleeve, a shaft mounted eccentrically therein, a cutter carried thereby, an operating collar or sleeve loosely mounted on said sleeve, and an eccentric ring connecting said collar and shaft whereby the rotation of said operating-collar first rotates said shaft to throw said cutter against the boiler-flue and then rotates said sleeve and cutter within said flue, substantially as described.

2. The combination, of a sleeve, a shaft mounted eccentrically therein, a cutter carried thereby, an operating collar or sleeve loosely mounted on said first-named sleeve and adapted to be driven concentrically therewith, and means operatively connecting said loose collar and said shaft, substantially as described.

3. The combination, with a sleeve, of a shaft mounted eccentrically therein, a cutter carried thereby, an operating collar or sleeve mounted on said first-named sleeve, an eccentric ring connecting said operating collar and shaft, a collar fixed on said first-named sleeve, a friction-collar loosely mounted on said sleeve and adapted to engage said fixed collar, and means for forcing said friction-collar into engagement with said fixed collar, substantially as described.

4. The combination, with a sleeve, of a shaft mounted eccentrically therein, a cutter mounted in arm formed integral with said shaft, an operating-sleeve loosely mounted on said first-named sleeve, an eccentric ring mounted on said shaft and connecting said shaft and operating-sleeve, and a steady-collar adjustably mounted on said first-named sleeve, substantially as described.

5. The combination with a main sleeve, of a shaft mounted eccentrically therein and carrying a cutter, an operating-sleeve loosely mounted on said main sleeve, an eccentric ring connecting said operating sleeve and shaft, a collar fixed on said main sleeve, a friction-collar loosely mounted on said operating-sleeve, and means for throwing said friction-collar into frictional contact with said fixed collar, substantially as described.

6. The combination, with a main sleeve, of a shaft mounted eccentrically therein and carrying a cutter, an operating-sleeve loosely mounted on said main sleeve, an eccentric ring connecting said operating sleeve and shaft, and a friction feeding device whereby the rotation of said main sleeve may be retarded, substantially as described.

7. The combination, with a main sleeve, of a shaft mounted eccentrically therein and carrying a cutter, an operating-sleeve loosely mounted on said main sleeve, an eccentric ring connecting said operating sleeve and shaft, a collar fixed on said main sleeve, a friction-collar loosely mounted on said operating-sleeve, means for throwing said friction-collar into contact with said fixed collar, and a loose collar provided on the front end of said main sleeve, substantially as described.

8. The combination, of a sleeve, a shaft mounted eccentrically therein, a cutter carried thereby, operating means adapted to operate concentric with said main shaft whereby said shaft is rotated within said sleeve to automatically throw said cutter into engagement with the boiler-flue and then said sleeve rotated by and with said shaft revolving said cutter within and against said flue, and a loose collar provided on the front end of said sleeve, substantially as described.

9. The combination, with a sleeve, a shaft mounted eccentrically therein, a cutter carried thereby, operating means adapted to operate concentric with respect to said main sleeve whereby said shaft is rotated within said sleeve to automatically throw said cutter into engagement with

the boiler-flue and then said sleeve thereby rotated by and with said shaft revolving said cutter within and against the flue, and means whereby the rotation of said sleeve is retarded to accelerate the rotation of said shaft in said sleeve, substantially as described.

10. The combination, with a main sleeve, of a shaft mounted eccentrically therein, a cutter carried thereby, operating means operating concentric with respect to said main sleeve whereby said shaft is rotated to automatically throw said cutter into engagement with the boiler-flue and said sleeve then rotated by and with said shaft revolving said cutter within and against the flue, means whereby the rotation of said sleeve is retarded to accelerate the rotation of said shaft in said sleeve, and a loose collar provided on the front end of said sleeve, substantially as described.

11. The combination, with a main sleeve, of a shaft mounted eccentrically therein and carrying a cutter, an operating-sleeve 9, a groove 14 adapted to be passed into a slot in said sleeve 9 and rest in a groove in said main sleeve, a collar 15 fixed on said main sleeve, a friction-collar 17 mounted loosely on said sleeve 9 and adapted to engage with said fixed collar 15, an eccentric ring 12 fixed on said shaft and operatively connected with said operating-sleeve, and a loose collar 16 provided on said main sleeve, said operating-sleeve adapted to be connected with the motive power, substantially as described.

12. The combination, of a sleeve, a shaft mounted eccentrically therein, a cutter carried thereby, an operating collar or sleeve loosely mounted on said sleeve, an eccentric ring connecting said collar and shaft whereby the rotation of said operating collar or sleeve first rotates said shaft to throw said cutter against the boiler-flue and then rotates said sleeve and cutter within said flue, and a steady-collar mounted on said first-named sleeve, substantially as described.

13. The combination, of a sleeve, a shaft mounted eccentrically therein, a cutter carried thereby, an operating collar or sleeve loosely mounted on said sleeve, an eccentric ring connecting said collar and shaft whereby the rotation of said operating collar or sleeve first rotates said shaft to throw said cutter against the boiler-flue and then rotates said sleeve and cutter within said flue, a steady-collar mounted on said first-named sleeve, and a collar loosely mounted on the front end of said main sleeve, substantially as described.

14. The combination, with a main sleeve, of a shaft mounted eccentrically therein and carrying a cutter, an operating-sleeve loosely mounted on said main sleeve, an eccentric ring connecting said operating sleeve and shaft, a friction feeding device whereby the rotation of said shaft in said main sleeve may be accelerated, and a steady-collar mounted on said main sleeve, substantially as described.

15. The combination, with a main sleeve, of a shaft mounted eccentrically therein and carrying a cutter, an operating-sleeve loosely mounted on said main sleeve, an eccentric ring connecting said operating sleeve and shaft, a friction feeding device whereby the rotation of said shaft in said main sleeve may be accelerated, and a collar loosely mounted on the front end of said main sleeve, substantially as described.

16. The combination, with a main sleeve, of a shaft mounted eccentrically therein and carrying a cutter, an operating-sleeve loosely mounted on said main sleeve, an eccentric ring connecting said operating sleeve and shaft, a friction feeding device whereby the rotation of said shaft in said main sleeve may be accelerated, a steady-collar mounted on said main sleeve, and a collar loosely mounted on the front end of said main sleeve, substantially as described.

17. The combination, of a sleeve, a shaft mounted eccentrically therein, a cutter carried thereby, operating means whereby said shaft is rotated within said sleeve to throw said cutter into engagement with the boiler-flue and said sleeve rotated by and with said shaft revolving said cutter within said flue, and a friction feeding device whereby the rotation of said shaft within said sleeve may be accelerated, substantially as described.

18. The combination, with a main sleeve, of a shaft mounted eccentrically therein, a cutter carried thereby, operating means whereby said shaft is rotated within said sleeve to throw said cutter into engagement with the boiler-flue and said sleeve then rotated by and with said shaft as said shaft continues to rotate revolving said cutter within and against the flue, means whereby the rotation of said main sleeve may be retarded to accelerate the rotation of said shaft in said sleeve, a loose collar provided on the front end of said sleeve, and a steady-collar mounted on said main sleeve, substantially as described.

19. The combination, with a main sleeve, of a shaft mounted eccentrically therein, a cutter carried thereby, operating means adapted to rotate in a forward direction first rotating said shaft within said sleeve and then carrying said sleeve with said shaft automatically feeding said cutter outward by the rotation of said shaft within said sleeve, and a steady-collar mounted on said main sleeve, substantially as described.

20. The combination, of a main sleeve, a shaft mounted eccentrically therein, a cutter carried concentrically thereby, and an operating collar or sleeve loosely mounted on said main sleeve and operatively connected with said shaft, said operating-collar operating concentric with respect to

said main sleeve, whereby the forward rotation of said operating-collar first rotates said shaft within said main sleeve to throw said outer into operative contact with the boiler-flue and then rotates said main sleeve and shaft together within said flue carrying said outer around against the inner surface thereof, substantially as described.

21. The combination, of a main sleeve, a shaft mounted concentrically therein, a outer carried concentrically thereby, an operating collar or sleeve loosely mounted on said main sleeve and operatively connected with said shaft, said operating-collar operating concentrically with respect to said main sleeve, whereby the forward rotation of said operating-collar first rotates said shaft within said main sleeve to throw said outer into operative contact with the boiler-flue and then rotates said shaft and sleeve together within said flue carrying said outer around against the inner surface thereof, and means in connection with said main sleeve whereby the rotation thereof may be retarded to accelerate the rotation of said shaft within said main sleeve, substantially as described.

702,850. LABEL. GEORGE E. HOWARD, Washington, D.C. Filed Dec. 6, 1901. Serial No. 94,946. (No model.)

Claim.—1. A label comprising a sheet of gelatin, which is dissolvable in water and adhesive, and has the label subject-matter printed thereon in reverse on its reverse side, which subject-matter is translatable upon the object to be marked or labeled.

2. A label consisting of a webbing having a gelatin or film spread thereon and carrying the label subject-matter printed in reverse on the medium thus formed.

3. A label consisting of a webbing having an adhesive gelatin or film spread thereon and carrying the label subject-matter printed in reverse on the medium thus formed.

4. A transparent label composed of a webbing having a transparent gelatin or film spread thereon and the medium thus formed carrying the label subject-matter.

5. A transparent label composed of a textile of comparatively fine fiber and coarse mesh and a transparent gelatin or film spread thereon, the medium thus formed carrying the label subject-matter.

6. A transparent label composed of a coarsely-woven transparent web, a transparent gelatin or film thickly spread thereon and having an adhesive surface, the label subject-matter printed in reverse on the adhesive surface of the gelatin or film.

702,851. SEALING IMPLEMENT. HARRY W. ABBOTT, Chicago, Ill., assignor to Porter Safety Seal Company, a Corporation of Illinois. Filed Aug. 20, 1901. Serial No. 73,644. (No model.)

Claim.—1. In an implement of the character described, the combination with suitably-connected hand-levers and dies carried thereby, of a hand-operated cord or tie-tightening device located adjacent to said dies, substantially as and for the purpose set forth.

2. In an implement of the character described, the combination with suitably-connected levers and dies carried thereby, of a cord or tie-tightening device located adjacent to said dies, and comprising a pivoted movable gripping member supported from one lever and a second gripping member pivotally connected with said first-named gripping member and serving to rotate said first-named gripping member.

3. In an implement of the character described, the combination with suitably-connected levers and dies carried thereby, of a laterally-project-

ing bracket, a gripping member pivotally connected therewith, and a gripping member pivotally connected with said first-named gripping member.

4. In an implement of the character described, the combination with suitably-connected levers and dies carried thereby, of a laterally-projecting bracket adjacent to said dies, and a gripping device supported from said bracket and movable in a transverse plane, said gripping device serving for tightening a cord or loop, substantially as described.

5. In an implement of the character described, the combination with suitably-connected levers and dies carried thereby, of a yieldingly-held pivoted gripper-disk provided with an arm, and a gripper-lever pivotally connected with said arm, the lower end of said last-named lever and an adjacent surface of said gripper-disk having coating gripping-surfaces.

6. In an implement of the character described, the combination of two levers pivotally connected at their rear ends, dies carried by the front ends of said levers, and a lever pivotally connected with the front end of one of said last-named levers and engaging and serving to depress the other of said levers, substantially as and for the purpose set forth.

7. In an implement of the character described, the combination of two levers pivotally connected at their rear ends, dies carried by the front ends of said levers, a lever pivotally connected with the front end of one of said last-named levers and engaging and serving to depress the other of said levers, and a gripping device supported from the front end of one of said last-named levers and movable in a transverse plane.

8. In an implement of the character described, the combination of a lever, a die connected with the front end thereof, a laterally-projecting bracket connected with the front end of said lever, a lever pivotally connected with said enlargements, an intermediate lever pivotally connected at its rear end with the rear end of said first-named lever and actuated by said second-named lever, and a gripping device carried by said laterally-projecting bracket.

9. In an implement of the character described, the combination of suitably-connected levers, dies carried thereby, one of said dies having a lateral flange or stop, a laterally-projecting bracket, and a gripping device carried by said bracket and movable in a transverse plane, said flange serving to prevent movement of the sealing-block during the operation of said gripping device, substantially as and for the purpose set forth.

10. In an implement of the character described, the combination of a slotted lever having upwardly-projecting side enlargements at its front end, a lever pivotally connected between said enlargements, an intermediate lever slotted in said first-named lever and pivotally connected at its rear end with the rear end of said first-named lever, a bracket carried by the front end of said first-named lever, and a transversely-movable gripping device carried by said bracket, substantially as and for the purpose set forth.

702,852. STEAM-HEATING APPARATUS. CHARLES H. ATKIN, Chicago, Ill., assignor to Warren Webster, Merchantsville, N.J. Filed Mar. 20, 1902. Serial No. 2,002. (No model.)

Claim.—1. A relief-valve device for steam-heating apparatus, consisting of a valve-body provided with an inlet and an outlet, an automatic valve controlled by the conditions on the inlet side of said valve-body to control said outlet, said valve device being provided with an air passage-way between the inlet and the outlet beyond the automatic valve, and a steam-barrier interposed in said air passage-way and composed of porous material pervious to air but impervious to steam in a state of vapor, whereby the air may escape through said steam-barrier and air passage-way independently of the operation of said automatic valve.

2. A relief-valve device for steam-heating apparatus, consisting of a valve-body provided with an inlet and an outlet, an automatic valve controlled by the conditions on the inlet side of said valve-body to control said outlet, said valve device being provided with an air passage-way between the inlet and the outlet beyond the automatic valve, and a steam-barrier interposed in said air passage-way and composed of porous material pervious to air and impervious to steam in a state of vapor, in combination with means to create a partial vacuum or lower pressure in the outlet of the valve device, whereby the air may be drawn out through said steam-barrier and air passage-way independently of the operation of said automatic valve.

3. A relief-valve device for steam-heating apparatus, consisting of a valve-body provided with an inlet and an outlet, an automatic float-valve controlled by the water of condensation on the inlet side of said valve-body to control said outlet, said valve device being provided with an air passage-way between the inlet and the outlet beyond the float-valve, and a steam-barrier interposed in said air passage-way and composed of porous material pervious to air but impervious to steam in a state of vapor, whereby the air may escape through said steam-barrier and air passage-way independently of the operation of said automatic valve.

4. In a steam-heating apparatus, the combination of a steam-radiating device provided with an outlet, a return-pipe communicating with said outlet, means to create a partial vacuum or lower pressure in said return, an automatic valve to control the communication between said radiator-outlet and the return, an air by-pass forming a communication between the radiator-outlet and the return beyond the said automatic valve, and a steam-barrier interposed in said by-pass between the outlet of the radiating device and the return consisting of porous material pervious to air and impervious to steam in a state of vapor, whereby the air is drawn out of said radiating device through said steam-barrier into the return without loss of uncondensed steam and the water of condensation may be discharged through said automatic valve.

702,853. WATER AND AIR RELIEF-VALVE FOR STEAM-PIPES. CHARLES H. ATKIN, Chicago, Ill., assignor to Warren Webster, Merchantsville, N.J. Filed July 22, 1902. Serial No. 24,462. (No model.)

Claim.—1. In a relief-valve for the purposes described, the combination of a valve-body having an inlet and an outlet, a movable cage within said valve-body fitting said outlet and provided with a valve passage-way communicating therewith, said cage being provided with an air passage-way communicating with said outlet, an automatic valve within said cage controlling the valve passage-way therein, and a porous steam-barrier between the inlet and the air passage-way in said cage.

2. In a relief-valve for the purposes described, the combination of a valve-body having an inlet and an outlet, an automatic valve normally controlling the thoroughfare between said inlet and outlet, a removable cage within the valve-body carrying said automatic valve and provided with an air passage-way communicating with the outlet beyond said valve, and a porous steam-barrier between the inlet and the air passage-way in said cage.

3. In a relief-valve for the purposes described, the combination of a valve-body having an inlet and an outlet, an automatic valve normally controlling the thoroughfare between said inlet and outlet, a removable cage within the valve-body carrying said automatic valve and provided with an air passage-way communicating with the outlet beyond said valve, a cap for said valve-body carrying said cage provided with an air passage-way communicating with the air passage-way in said cage, and a porous steam-barrier carried by said cap and interposed between the inlet of the valve-body and the air passage-way in the cap.

4. In a relief-valve for the purposes described, the combination of a valve-body having an inlet and an outlet, an automatic valve normally controlling the thoroughfare between said inlet and outlet, a removable cage within the valve-body carrying said automatic valve and provided with an air passage-way communicating with the outlet beyond said valve, a cap for said valve-body carrying said cage and provided with an extension, a tubular porous steam-barrier carried by said cap and having one side in communication with the inlet, said cap being provided with an air passage-way leading from the other side of the tubular steam-barrier to the air passage-way in the cage.

5. In a relief-valve for the purposes described, the combination of a

valve-body having an inlet and an outlet, an automatic valve normally controlling the thoroughfare between said inlet and outlet, a cap closing said valve-body and carrying a casing having an air passage-way communicating with the outlet beyond the automatic valve, a tubular porous steam-barrier in said casing having one end sealed against the casing, a cap closing the other end of the casing and sealed against the other end of the said porous barrier, said air passage-way in the casing opening to the exterior of the tubular barrier and the interior of the barrier communicating with the inlet.

6. In a relief-valve for the purposes described, the combination of a valve-body having an inlet and an outlet, a cap closing said valve-body and having a supplemental threaded nipple, a valve-cage carried by said nipple independently of the valve-body and having a valve passage-way communicating with the outlet, a valve in said cage to control said valve passage-way, said cap being provided with an air passage-way communicating with the outlet beyond said valve, and a porous steam-barrier between said air passage-way and the inlet of the valve-body.

7. In a relief-valve for the purposes described, the combination of a valve-body having an inlet and an outlet, a cap closing said valve-body and having a supplemental nipple, a valve-cage carried by said nipple independently of the valve-body and having a portion fitting and partially closing said outlet and provided with a valve passage-way communicating therewith, and an automatic valve carried by said cage and controlling said valve passage-way.

702,854. SURVEYING INSTRUMENT. JOHN BRAL, Denver, Colo. Filed Feb. 5, 1902. Serial No. 23,265. (No model.)

Claim.—1. The combination, of a frame revolvably mounted and provided with two upwardly-projecting arms, a telescope transverse on said arms, a graduated concentric plate, attached to the telescope and occupying a plane perpendicular to the platform, one frame-arm having an offset end projecting upwardly therefrom and outwardly through an opening in the graduated plate, the arrangement being such that the plate is free to move with the telescope as the latter is turned on its transverse, the graduated part of the plate adjacent the offset of the frame-arm, being outside of the latter, substantially as described.

2. The combination of a frame revolvably mounted and comprising a base and upwardly-projecting arms, a telescope transverse on said arms at their upper extremities, a concentric graduated plate attached to the telescope and occupying a position perpendicular to the platform, one of the frame-arms having an offset, the said arm projecting upwardly and outwardly from said offset through an opening in the plate whose lower portion is outside of the frame, a micrometer-screw journaled on the offset part of the arm and engaging the edge of the plate which is toothed therefor, and an index or pointer mounted on the offset adjacent the graduated edge of the plate, substantially as described.

3. The combination of a frame revolvably mounted and comprising a base and upwardly-projecting arms, a graduated plate attached to the base of the frame parallel with the platform, a compass mounted on the base of the frame between the arms, a telescope transverse on the upper extremities of the arms, a graduated plate mounted to move with the telescope and occupying a position perpendicular to the platform of the instrument, one of the frame-arms having an offset projecting inwardly above the base of the frame, the said arm projecting outwardly through an opening in the last-named graduated plate, whereby the lower part of the latter is outside of the frame-arm, a micrometer screw journaled in the offset of the frame-arm and engaging the edge of the perpendicular plate which is toothed for the purpose, and an index or pointer mounted on the offset adjacent the said plate, substantially as described.

702,855. WARNING-MACHINE. DAVID BOORMAN and ALBERT F. SHARP, Auburn, Pa.; said Sharp assignor to WILLIAM H. SHARP and JOHN E. WILLIAMS, Allentown, Pa. Filed Nov. 15, 1901. Serial No. 736,908. (No model.)

Claim.—1. In a washing apparatus, the combination with a clothes-receptacle, a plunger disposed therein and a plunger-rod projecting through one end of the clothes-receptacle, of a cylinder secured to one end of the clothes-receptacle and into which plunger-rod projects, a piston secured to the plunger-rod within said cylinder, inlet-pipes communicating with the respective ends of said cylinder, a valve for controlling the alternate entrance and exhaust of motive fluid through said pipes and means connected with and actuated by the movements of the plunger in the clothes-receptacle for operating said valve, substantially as set forth.

2. In a washing apparatus, the combination with a clothes-receptacle, a plunger therein and a plunger-rod projecting through one end of the clothes-receptacle, of a cylinder secured to one end of the receptacle and into which said plunger-rod projects, a piston in the cylinder and secured to the plunger-rod, a valve-cock having four ports, supply-pipes connecting two of said ports with the respective ends of the cylinder and the other two ports constituting inlet and exhaust ports respectively, a valve in said cock to connect the respective supply-ports alternately with the inlet-port and exhaust-port, a plate or arm secured to the stem of the valve, a weighted arm mounted loosely on said stem and having a part to engage said plate or arm alternately at respective sides of its center, a rod connected to and movable with the plunger in the clothes-receptacle, and adjustable lugs on said rod to throw the weighted arm and effect the shifting of the valve as said plunger moves from end to end of its throw.

702,856. BAR-BELL. ALAN CALVERT, Philadelphia, Pa., assignor to himself and Anro Darby Lamm, trading as the McE Bar Bell Company. Filed Jan. 2, 1902. Serial No. 94,103. (No model.)

Claim.—1. A bar-bell having a hallow head, a mass of loose weighting pieces therein, a follower adapted to adjust the weight-receiving capacity of the chamber in said head and tighten said pieces, said follower being provided with an opening offering access to said chamber without displacement of the follower and a closure for said opening.

2. A bar-bell having a hallow head, a mass of loose polist-weights therein, a follower therein adapted to be moved in and out to adjust the

weight-receiving capacity of the chamber in said head, said follower being provided with an opening adapted to form a communication with said chamber from the exterior of the head, and a closure for said opening.

3. In a bar-bell, a hallow head, a screw rising from the base thereof, a follower in said head mounted on said screw, said follower being provided with an opening, means for connecting said screw with said head, means for connecting said head with the handle of the device and a removable closure for said opening.

702,857. DETONATING COMPOSITION. HANS VON DANKER, Vienna, Austria-Hungary. Filed Dec. 2, 1901. Serial No. 94,468. (No specimens.)

Claim.—1. A detonating composition consisting of a mixture of copper-ammonium nitrate, potassium nitrate, sulfur and aluminium, substantially as described.

2. A detonating composition consisting of a mixture of substantially from thirty to forty parts of copper-ammonium nitrate, forty-two to twenty-five parts of potassium nitrate, ten to seven parts of sulfur and eighteen to twenty-eight parts of aluminium.

3. A detonating composition consisting of a mixture of copper-ammonium nitrate, potassium nitrate, sulfur, aluminium and a suitable nitrate-of-ammonium explosive substantially as described.

702,858. PHOTOGRAPHIC CAMERA. ALBERT D. DAVIS, York, N. Y., assignor of one-half to Frederick W. Livermore, New York. N. Y. Filed Apr. 18, 1901. Serial No. 94,710. (No model.)

Claim.—1. In a camera, a frame carrying the focusing member of the camera, and a stop and spring co-operating together to maintain the focusing-member-carrying frame in an upright position, said spring exerting a pressure in one direction on said frame and the stop acting in opposition thereto, and said frame adapted to move away from the stop when the tension of the spring is overcome in the operation of closing the camera, substantially as described.

2. In a camera, a frame carrying the focusing member of the camera, an adjustable stop and means co-operating therewith to maintain the focusing-member-carrying frame, in an upright position at various adjustments, substantially as described.

3. In a camera, a frame carrying the focusing member of the camera, a support with which said frame has a swinging connection, a spring connected with a part of said frame and with a member against which it bears, and a stop co-operating with said spring to maintain said frame in an upright position, said spring exerting a pressure in one direction on said frame and the stop acting in opposition thereto, and said frame adapted to move away from the stop when the tension of the spring is overcome in the operation of closing the camera, substantially as described.

4. In a camera, a frame carrying the focusing member of the camera, a support with which said frame has a swinging connection, means for limiting the movement of said frame in one direction consisting of a stop and a pawl, and a spring co-operating with said means for maintaining said frame in an upright position, substantially as described.

5. In a camera, a frame carrying the focusing member of the camera, a support with which said frame has a swinging connection, means for limiting the movement of said frame in one direction consisting of a pawl and a series of steps for stopping the movement at various adjustments, and a spring co-operating with said means for maintaining said frame in an upright position, substantially as described.

6. In a camera, a frame carrying the focusing member of the camera, a support with which said frame has a swinging connection, means for limiting the movement of said frame in one direction consisting of a stop and a spring-influenced pawl, and a spring co-operating with said means for maintaining said frame in an upright position, substantially as described.

7. In a camera, a frame carrying the focusing member of the camera, a support with which said frame has a swinging connection, means for

limiting the movement of said frame in one direction consisting of a spring-influenced pawl and a stop, and means co-operating with said means for maintaining said frame in an upright position, substantially as described.

8. In a camera, a frame carrying the focusing member of the camera, a support for said frame, a piston effecting a swinging connection of said frame with said support, a spring connected at one point with said support and at another point with a part of said frame, a shell formed with a ratchet and connected to said frame, a pawl to engage said ratchet and having a slotted shank, through which a guiding pin or pinion passes, and a spring acting on said pawl, substantially as described.

702,859. GUN-CLEANING TOOL. ALFRED H. DUNSTON, Syracuse, N. Y. Filed Jan. 2, 1901. Serial No. 41,794. (No model.)

Claim.—1. A gun-cleaning tool comprising a main body, a part having its rear end normally fixed to the main body, supporting members arranged on opposite sides of said part and formed of spring material, said supporting members having their rear ends fixed relatively to the main body and their front ends movable lengthwise of said part, and abrasive members mounted on the supporting members, substantially as and for the purpose described.

2. A gun-cleaning tool comprising a main body, a part having its rear end adjustable lengthwise of the main body and normally fixed thereto, supporting members arranged on opposite sides of said part and formed of spring material, said supporting members having their rear ends fixed relatively to the main body and their front ends movable lengthwise of said part, and abrasive members mounted on the supporting members and connected to said part, substantially as and for the purpose specified.

3. A gun-cleaning tool comprising a main body, opposite supporting members formed of spring material and having their rear ends fixed to the main body, abrasive members mounted on the supporting members, and an adjusting part for forcing outwardly the intermediate portions of the supporting members, said adjusting part having its rear end adjustable lengthwise of the main body and normally fixed thereto and having its front end connected to the corresponding ends of the supporting members, substantially as and for the purpose described.

4. A gun-cleaning tool comprising a main body formed with a threaded longitudinal socket, opposite supporting members formed of spring material and having their rear ends fixed to the main body, abrasive members mounted on the supporting members, and an adjusting part for forcing outwardly the intermediate portions of the supporting members, said adjustable part having its rear end adjustable lengthwise in the threaded socket and normally fixed thereto and having its front end provided with a shoulder for forcing rearwardly the front ends of the supporting members, substantially as and for the purpose specified.

5. A gun-cleaning tool comprising a main body, opposite supporting members formed of spring material and having their rear ends fixed to the main body and their front ends provided with laterally-extending portions lapped upon each other, abrasive members mounted on the supporting members, and an adjusting part for forcing outwardly the intermediate portions of the supporting members, said adjusting part having its rear end adjustable lengthwise of the main body and normally fixed thereto and having its front end connected to the laterally-extending portions of the front ends of the supporting members, substantially as and for the purpose set forth.

6. A gun-cleaning tool comprising a main body formed with a threaded longitudinal socket, opposite supporting members formed of spring material and having their rear ends fixed to the main body and their front ends provided with laterally-extending portions lapped upon each other and formed with notches aligned with each other, abrasive members mounted on the supporting members, and an adjusting part for forcing outwardly the intermediate portions of the supporting members, said adjustable part having its rear end adjustable lengthwise in the threaded socket and normally fixed thereto and having its front end passed through the notches in the laterally-extending portions of the supporting members and provided with a shoulder arranged in advance of said laterally-extending portions for forcing the same rearwardly, substantially as and for the purpose described.

7. A gun-cleaning tool comprising a main body, opposite supporting members formed of spring material and having their rear ends fixed to the main body and their front ends separable, abrasive members mounted on the supporting members and having their rear ends fixed to the main body and their front ends united together in advance of the separable ends of the supporting members, and an adjusting part for forcing outwardly the intermediate portions of the supporting members, said adjusting part having its rear end adjustable lengthwise of the main body and normally fixed thereto and having its front end provided with a shoulder

arranged in advance of the point of union of the abrasive members, substantially as and for the purpose specified.

8. A gun-cleaning tool comprising a main body formed with a threaded longitudinal socket and slots arranged on opposite sides of the socket, opposite supporting members formed of spring material and having their rear ends fixed to the main body within said slots and their front ends separable and provided with laterally-extending portions lapped upon each other and formed with notches aligned with each other, abrasive members mounted on the supporting members and having their rear ends fixed to the supporting members within said slots and their front ends united together in advance of the separable ends of the supporting members, and an adjusting part having its rear end adjustable lengthwise in the threaded socket and normally fixed thereto and having its front end passed through the notches in the laterally-extending portions of the supporting members and provided with a shoulder arranged in advance of the point of union of the abrasive members, substantially as and for the purpose set forth.

702,860. AUTOMATIC-CUT-OFF SAWING-MACHINE. WILLIAM M. DUNSTON, Detroit, Mich. Filed Jan. 30, 1902. Serial No. 91,946. (No model.)

Claim.—1. In a device of the character described, the combination with the frame formed with guides and a feed-table secured thereto and located above the said frame-guides, of a shaft journaled in the frame; a cam and crank disk upon the shaft, means for rotating said shaft, a saw-carriage mounted in the said guides of the frame below the said feed-table, a rod connecting said saw and disk, a second rod co-operating with said cam and having its forward end mounted in bearings on the upper face of the feed-table, a yielding finger secured to the forward end of said second rod, a stop on said feed-table against which said finger is adapted to clamp the material to be cut, said finger and carriage being driven from a common shaft in timed relation to each other.

2. In a device of the character described, the combination with the main frame formed with guides, of a saw-carriage mounted in said guides, a shaft and actuating means therefor, a cam-disk carried by said shaft, a rod connecting said disk and carriage, a second rod extending above the saw-carriage and at one end carrying an antifriction-wheel traveling in rolling contact with said cam and bent at its other end at an approximate right angle, a tubular sleeve secured to outer end of said bent portion and lying in a plane parallel to the body portion of said rod, a finger provided with a curved-threaded shank mounted in said sleeve, a coil-spring connected to the said finger and sleeve, whereby the said finger will be yieldingly held, and adjusting-nuts on the inner end of the said screw-threaded shank.

702,861. STORAGE BATTERY. ARTHUR D. ROCHSTER, Philadelphia, Pa., assignor of one-half to Harry C. Oampton and John W. Jennings, Philadelphia, Pa. Filed Nov. 12, 1900. Serial No. 94,948. (No model.)

Claim.—1. In a storage battery of the character recited, the combination of the series of superposed, pan-shaped lead plates having their flaring sides provided with perforations, the perforations of each plate leading into the space between it and the next succeeding plate, whereby the excess of the electrolyte in one of said plates will overflow into the next plate, and so on, and a separating layer between said plates consisting of an absorbent, non-conducting, acid-resisting material, substantially as and for the purpose set forth.

2. In a storage battery of the character described, the series of superposed pan-shaped lead plates having their flaring sides provided with perforations on opposite sides of successive plates, the perforations of each plate leading into the space between it and the next succeeding plate, substantially as and for the purpose specified.

3. In a storage battery of the character described, the combination of the series of pan-shaped lead plates, having the perforated sides, intervening energizing substance, a separating layer between said plates consisting of an absorbent, non-conducting, acid-resisting substance, and means for effecting the recirculation of the electrolyte, and means for regulating the temperature of the same before it is returned to the battery, substantially as and for the purpose set forth.

702,862. TEST-CLIP. WILLIAM W. KENNEDY, Boston, Mass., assignor to Charles S. Gooding, Brookline, Mass. Filed Nov. 5, 1901. Serial No. 81,313. (No model.)

Claim.—1. As an article of manufacture, a test-clip for cables, comprising a plate adapted to be attached to a cable, provided with a chamber, and a cover detachably attached to said plate.

2. As an article of manufacture, a test-clip for cables comprising a plate adapted to be attached to a cable, provided with a chamber extending therefrom, and a cover detachably attached to said plate and closing said chamber on one side thereof.

3. As an article of manufacture, a test-clip for cables comprising a plate adapted to be attached to a cable, provided with a chamber, a cover detachably attached to said plate, and a packing introduced between said cover and plate.

4. As an article of manufacture, a test-clip for cables comprising a plate adapted to be attached to a cable, provided with a chamber, a cover detachably attached to said plate and means contained within said chamber for connecting the free ends of two wires to each other.

5. As an article of manufacture, a test-clip for cables comprising a plate adapted to be attached to a cable, provided with a chamber, a cover detachably attached to said plate, and means contained within said chamber and insulated from said test-clip for connecting the free ends of two wires to each other.

6. In combination, a cable consisting of strands of wire incased in a

lead covering, said covering having an opening in the periphery thereof and a test-clip fast to said covering and inclosing said opening.

7. In combination, a cable consisting of strands of wire incased in a lead covering, and a test-clip comprising a plate fast to said covering, provided with a chamber, and a cover detachably attached to said plate.

8. In combination, a cable consisting of strands of wire incased in a lead covering, a test-clip comprising a plate fast to said covering, provided with a chamber extending therefrom, and a cover detachably attached to said plate and closing said chamber on one side thereof.

9. In combination, a cable consisting of strands of wire incased in a lead covering, a test-clip comprising a plate fast to said covering, provided with a chamber, a cover detachably attached to said plate, and means contained within said chamber for connecting the free ends of two wires leading from said cable to each other.

702,863. FUL-LOCK AND KEY. JOHN F. FINNER, Dundee, Ill. Filed Apr. 5, 1901. Serial No. 84,484. (No model.)

Claim.—1. The combination with an axle having a reduced end portion, of a recessed nut adapted to such reduced portion and having a perforation for the reception of a locking-pin, and a spring-pressed locking-pin carried by the reduced portion of the axle and adapted to extend centrally through the perforation to prevent access of foreign matter therein, said pin having fixed limits of inward and outward movement.

2. The combination with an axle having a reduced end portion, of a nut adapted to said reduced end portion, and having a perforation for the reception of a locking-pin, and a spring-pressed locking-pin carried by the axle and adapted to said perforation, said pin having a shoulder for engagement with the inner wall of the nut, and a second shoulder adapted to prevent excessive inward movement of said pin.

3. The combination with an axle having a reduced end portion, of a recessed nut adapted to such reduced portion and having a perforation for the reception of a locking-pin, interfitting and abutting lugs provided on both the reduced end portion of the axle and the nut to prevent excessive movement of the latter, and a locking-pin carried by the axle and adapted to extend within said perforation.

4. The combination with an axle having a reduced end portion, a recessed nut adapted thereto and having a perforation for the reception of a locking-pin, interfitting and abutting lugs provided on the axle and nut, a locking-pin having an enlarged central portion forming end shoulders for preventing excessive outward movement of the pin, said pin being adapted to a suitable opening in the end of the axle, and a spring seated within said opening and normally projecting the pin, substantially as specified.

702,864. ELEVATOR SWITCH. JAMES J. FLINT, Denver, Colo. assignor to the Flint-Lamex Electric and Manufacturing Company, Denver, Colo. Filed July 20, 1901. Serial No. 70,082. (No model.)

Claim.—1. In an electric switch, the combination with a switch-base, push-button, and a frame attached to the base, of a rocking plate pivoted on the frame at its inner extremity and projecting laterally on opposite sides of said pivot, the plate having an outwardly-projecting arm, a rocking bar pivoted on the frame between the rocking plate and the push-button, and provided with a central opening into which the outwardly-projecting arm of the rocking plate passes, the rocking bar having inwardly-projecting arms arranged on opposite sides of the arm of the rocking plate, the outer extremity of the rocking-plate arm having a cross-piece, coil-springs connecting the respective extremities of the cross-piece with the inner extremities of the rocking-bar arms, and rods or links passing through the central opening of the rocking bar, and connecting the extremities of the rocking plate on opposite sides of the pivot, with the push-button.

2. In an electric switch, the combination with a switch-base and

push-button, of a frame attached to the base and having two separated inwardly-projecting parts whose inner extremities are bent toward each other, a rocking plate mounted between the inner extremities of the frame parts, a rivet connecting the said frame-part extremities and forming the fulcrum of the rocking plate which is provided with an arm, a rocking bar pivoted on the frame and provided with an arm, the plate and the bar being separated and having their arms projecting in opposite directions, a spring connecting the arms of the two parts and arranged to hold them firmly in either position of adjustment, and two links or rods attached to the push-button and connecting the rocking plate on opposite sides of its fulcrum.

3. In an electric switch, the combination with a base, a frame and push-button, of a rocking plate fulcrumed on the inner extremity of the frame, having laterally-projecting arms and an outwardly-projecting arm, a rocking bar pivoted on the frame and centrally bifurcated, the said bar being located between the rocking plate and the push-button, its opposite extremities being provided with contacts insulated from the body of the bar, the arrangement being such that the inwardly-projecting arm of the rocking plate passes into the central opening of the rocking bar which is provided with two inwardly-projecting arms, one extending from each part of its bifurcated portion, coil-springs connecting the inner extremities of the rocking-bar arms, with the outer extremity of the rocking-plate arm, and rods or links connecting the rocking plate on opposite sides of its pivot with the respective push-button.

4. In an electric switch, the combination with a base, a frame and push-button, of a rocking plate pivoted on the frame at its inner extremity, projecting equally on opposite sides from said pivot, the parts on the opposite sides of the pivot, having lateral projections, the rocking plate having also an outwardly-projecting arm, a rocking bar fulcrumed on the frame between the rocking plate and the push-button, said bar being centrally bifurcated, its extremities having contacts insulated from the body of the bar which is provided with two inwardly-projecting arms one extending from each part of its bifurcated portion, one of the said rocking-bar arms projecting into the path of the said lateral projections of the rocking plate, coil-springs connecting the outer extremity of the rocking-plate arm, with the inner extremities of the rocking-bar arms, and links or rods connecting the rocking plate with the push-button.

5. In an electric switch, the combination with a base, a frame, push-button, and brushes, of a rocking plate pivoted on the inner extremity of the frame and provided with parts extending equally on both sides of its pivot, and an outwardly-projecting arm, a rocking bar fulcrumed on the frame between the rocking plate and the push-button, said bar being centrally bifurcated, and its extremities being provided with contacts insulated from the body of the bar and arranged to engage the brushes, the inwardly-projecting arm of the rocking plate projecting into a central opening of the bar, the said bar having an arm projecting inwardly from each bifurcated part, coil-springs connecting the inner extremities of the rocking-bar arms with the outer extremity of the rocking-plate arm, and links passing through the central opening of the rocking bar, and connecting the rocking plate with the push-button.

6. In an electric switch, the combination with a base, a cover, push-button and brushes, of a frame attached to the base and having two separated inwardly-projecting parts whose inner extremities are bent toward each other, a bridge-piece connecting said extremities and secured to the cover, a rocking plate pivoted between the inner extremities of the frame parts, and provided with an outwardly-projecting arm, a rocking bar fulcrumed on the frame between the rocking plate and the push-button, its central part being bifurcated and its extremities having contacts insulated from the body of the bar and arranged to cooperate with the brushes, the arm of the rocking plate entering the central opening of the said bar which is provided with inwardly-projecting arms, one arm extending from each part of the bar's bifurcated portion, the rocking plate being provided with projections arranged to engage one of the rocking-bar arms, coil-springs connecting the arm of the rocking plate with the arms of the rocking bar, and rods or links connecting the rocking plate with the push-button, substantially as described.

702,865. GRABBING OR SCORING AND HITTING MECHANISM FOR PAPER-BOX MANUFACTURE. CHAMBERLAIN W. SALT, West Spring, Md. Filed Oct. 18, 1900. Serial No. 33,671. (No model.)

Claim.—1. In a paper-box-blank-making machine, the combination with cross-cutting devices comprising plates or blades arranged for operation as described, of a die for marginally operating on the blank, which is adjustable overwise of the machine, and having its follow die formed by a part of one of the cross-cutting blades.

2. In a paper-box-blank-making machine, a pair of cross-cutting plates or blades and supports on which they are endwise adjustable, opposite ends of the blades being V ends, of two dies for marginally operating on the blank, also adjustable on said supports, independently of

said plates, and in the line of the length of the latter, all arranged to have matching positions to transversely score and marginally miter blanks of different widths, substantially as described.

3. In a blank-making mechanism, the combination with the die-carrier 82, 83, each having three or more endwise-adjustable scoring-plates, and opposite ends thereof constituting marginally-operating die members, and means for confining said plates in their adjustments; of the die members 80 overlying opposite end portions of the scoring-plates, and each said member 80' consisting with a die-forming end of the relatively opposite scoring-plate, and having an angular extension overlying the face of its respective die-carrier; and having means engaged therewith for confining it in its adjusted position relatively to the length of the die-carrier.

4. The one die-carrier having a slot; and a die plate or blade, having its end formed V shape, provided with a threaded stud or bolt playing in and along said slot, and having a confining end therefor; combined with a second die support or carrier having a slot; and a mitering die provided with a threaded stud playing in and along said slot, and having a confining end therefor.

5. The combination with the die supports or carriers having the longitudinal slots 53 and 41; the scoring-die plates, or blades, 79 and 80, having their opposite ends constructed with V-shaped recesses 100, and having the threaded studs extending through the slots 53, and having the confining ends 47; of the mitering-die 80', having the angular extension 46, arranged to overlie opposite end portions of the die-plates 79, 80; screw studs or bolts, playing in and through the slots 47, and engaging the die extensions, and confining ends 80' therefor, substantially as described and shown.

6. In a paper-box-blank-making machine, the duplicated device for scoring the strip longitudinally each consisting of separated stationary die-walls having the space between each set stopped, and the stop in the one device being opposite the location of the stop in the other device.

7. In a paper-box machine, the duplicated device for scoring the strip longitudinally each consisting of separate stationary die-walls having the space between each set stopped, the stop in the one device being opposite the location of the stop in the other device, and each device being bodily adjustable overwise of the line of feed of the stock there-through, substantially as described.

8. In a paper-box-blank-making machine, cross-cutting devices comprising plates or blades arranged for operation as described, of a mitering-die which is adjustable overwise of the machine, and having its follow die formed as a part of one of the cross-cutting blades, combined with the pair of longitudinal scores each comprising separated die-walls having the space between them stop-formed, the stop of the one being opposite that of the other, and each device being bodily adjustable overwise, for the purpose set forth.

702,866. GATE. CHARLES R. FENNELL, Georgetown, Tex. Filed Nov. 4, 1901. Serial No. 81,000. (No model.)

Claim.—1. In a gate of the class described, the combination of a frame, an upright shaft having its ends journaled in bearings formed in or attached to the frame, arms radiating from and fixed by hubs to the

JUNE 10, 1902.

shaft, a band held to the arms concentrically with the shaft, and wire connecting the arms to the said band, substantially as described.

2. In a gate of the class described, the combination of a frame, an upright shaft having its ends journaled in bearings formed in or attached to the frame, arms radiating from and fixed to the shaft, and a band held to the arms concentrically with the shaft, substantially as described.

3. As an improved article of manufacture in a gate of the class described a shaft having its ends journaled in bearings, and having staple-shaped or analogous rods radiating therefrom, a band held to the said rods, and wire connecting the rods to the said band, substantially as described.

702,867. PNEUMATIC-TRANSFER-TUBE SYSTEM. FRANK W. JOURN, New York, N. Y., assignor to the Transfer Tube Company, New York, N. Y., a Corporation of New York. Filed Apr. 26, 1902. Serial No. 104,805. (No model.)

Claim.—1. The combination with a tube of a reversible air-pump connected to one end thereof, a hinged gate at one end of the tube, an electromagnetic device to hold the gate closed, an automatic circuit-breaker at each station in the path of a moving carrier, a circuit-closer at each station and two circuits each including said electromagnetic device, a circuit-closer at one station and an automatic circuit-breaker at the other station.

2. The combination of a pneumatic tube, a reversible, motor-driven, air-pump, a tubular connection between said pump and one end of the tube, a gate at one end of the tube, a motor-starting device at each station, a circuit-closer at each station operated by the starting device, an automatic circuit-breaker at each station in position to be moved by a passing carrier, an electromagnetic device to hold said gate closed and electrical conductors arranged in two circuits each circuit including said electromagnetic device, a circuit-breaker at one station and a circuit-closer at the other station.

702,868. REIN-HOLDER. THOMAS KEMPTER, Philadelphia, Pa. Filed Apr. 5, 1902. Serial No. 101,915. (No model.)

Claim.—1. A rein-holder consisting of a plate adapted to be attached to the dashboard of a vehicle, a slot in said plate, and a clip consisting of a plurality of yielding members which are on opposite sides of said slot.

2. A rein-holder consisting of a plate adapted to be secured to the dashboard of a vehicle, a longitudinally-extending slot in said plate, a clip composed of two members located in said slot, one of said members having an outwardly-flaring and projecting beyond the extremity of said slot.

702,869. BLACK SULFUR DYE AND PROCESS OF MAKING SAME. IVAN LEVINSKY and CARL MANNING, Manchester, England, assignors to Levinstein, Limited, Manchester, England. Filed Oct. 2, 1901. Serial No. 77,226. (Specimen.)

Claim.—1. The heretofore-described process for the production of black sulfid coloring-matters, which consists in heating in the wet way and with the condition of dilution maintained, the heretofore-described nitrophenols with oxysulfonates and with sulfur and a sulfid of an alkali metal, substantially as set forth.

2. As new black sulfid coloring-matters, a black powder produced by heating in the wet way and with the condition of dilution maintained, the heretofore-described nitrophenols with oxysulfonates and with sulfur and a sulfid of an alkali metal, which powder is insoluble in water, insoluble in alcohol, soluble in a solution of sodium sulfid with a greenish-black color, soluble in concentrated sulfuric acid and precipitated therefrom on dilution with water, and dyes unmercerized cotton shades varying from bright red-black to greenish black.

702,870. BED-RAIL. ERNE G. LANGEWEY, Los Angeles, Cal. Filed Mar. 2, 1902. Serial No. 94,504. (No model.)

Claim.—1. The combination with the bedstead of the supplementary extension-rail A provided with the head-block B, adjustably secured thereto; adjusting-strap D removably secured to said extension-rail, and adapted to partly surround the corner-posts of the bedstead and to hold the same, in combination therewith.

2. In a bedstead the combination with the bedstead of an extension-rail A, the head-block B, adjustably secured thereto, adjusting-strap D interposed between the block and the rail and having a longitudinal movement therebetween, the strap being adapted to partly surround the bed-post and hold the rail and head-block in engagement therewith, and binding-balls C to hold the rail, the head-block and the adjusting-strap in frictional engagement, substantially as shown and described.

702,871. MOTOR-DRIVEN DEVICE OR MECHANISM. EMERY A. MEYER, Cincinnati, Ohio. Original application filed Apr. 13, 1901. Serial No. 94,729. Divided and this application filed July 12, 1901. Serial No. 93,103. (No model.)

Claim.—1. In a motor-actuated mechanism, driving and driven members, and a wrist connection therebetween comprising a pin on one member, and a removable bushing, constituting the bearing for the other member, fitted on said pin and having an outer integral retaining-flange, substantially as described.

2. In a motor-actuated mechanism, driving and driven members, and a wrist connection therebetween comprising a threaded pin on one member, and an interiorly-threaded bushing constituting the bearing for the other member, secured upon said pin and having an outer peripheral flange, substantially as described.

3. In a motor-actuated mechanism, driving and driven members, and a wrist connection therebetween comprising a threaded pin on one member, and an interiorly-threaded bushing, constituting the bearing for the other member, secured upon said pin and having a screw-headed cap provided with a peripheral retaining-flange, substantially as described.

4. In a motor-actuated mechanism, driving and driven members, and a wrist connection therebetween comprising a hollow pin adapted to contain a lubricant and having a lateral oil-part, and a removable bush-

U. S. PATENT OFFICE.

3525

ing, constituting the bearing for the other member, fitted on said pin and having integrally therewith an outer cap and peripheral retaining-flange, substantially as described.

5. In a motor-driven mechanism, including an electric motor, the combination with the armature having a core, of the shaft enclosed within said core, a sleeve fitting on said shaft and coupling the same with the core, a crank driven by said shaft, and a block or cross-head reciprocated from said crank, substantially as described.

6. In a motor-driven mechanism including an electric motor, the combination with the armature having a core, of the shaft screw-threaded at one end, a coupling member screwing thereon and notched at one end to engage said core, said clutch member being threaded externally at its other end, a crank screwd thereon, a block or cross-head, and reciprocating connections between the latter and the crank, substantially as described.

7. In a motor-driven mechanism including an electric motor, the combination with the armature and its core, of the shaft screw-threaded at one end, a coupling member screwing thereon and notched at one end to engage said core, said clutch member being threaded externally at its other end, a crank screwd thereon, a block or cross-head, and reciprocating connections between the latter and said crank, substantially as described.

8. In a motor-driven mechanism, the combination with the motor-shaft, of a coupling member on one end thereof locking the shaft to the motor, said coupling member being grooved externally, and anti-friction-bearings comprising adjustable grooved rings and rotatable balls confined between the grooves of said rings and coupling member, substantially as described.

9. In a motor-driven mechanism including an electric motor, the combination with the armature-shaft, and the motor-frame having the circular frame at each side thereof, of the coupling member between the shaft and the armature, the same having an external groove, the stationary rings in said rings, the duplicate rings in each stationary ring sitting in forming raceways containing anti-friction-balls, a crank driven by the shaft, a block or cross-head, and reciprocating connections between said block and the crank, substantially as described.

10. In a motor-driven mechanism including an electric motor, the combination of the armature-shaft having a core, a coupling member locking the core to the shaft, a crank fitted on said coupling member and operating a device, and anti-friction ball-bearings for each end of said shaft, substantially as described.

702,872. CONDUCTOR FOR CONCRETE. WILLIAM W. MONTGOMERY, Chicago, Ill., assignor of one-half to Thomas H. Montgomery, Chicago, Ill. Filed May 27, 1901. Serial No. 92,084. (No model.)

Claim.—1. In an apparatus of the class set forth, the combination of a conveyor consisting of a series of hollow cylindrical sections telescoped partially into each other at their adjacent ends and having rigid, close joints at each of said telescopic connections, a supporting-cable detachably attached to each of said sections, means for raising and lowering said supporting-cable and the attached conveyor, and means detachably connected to the topmost section for introducing the material to be conveyed into said topmost section, whereby the conveyor may be swung about at its lower end without pivotal or telescopic action at the joints and may be

extended by the addition of sections to or shortened by the removal of sections from the upper end of the conveyor.

2. In an apparatus of the class described, the combination of a conveyor consisting of a series of hollow cylindrical sections having the same diameter and tapered to telescope partially into each other at their adjoining ends, these joints being rigid but detachable, a supporting-cable attached to the lowermost section of the conveyor and adapted thereby to support the entire conveyor, means for detachably connecting the remaining sections to the cable, whereby said sections may be removed one by one from the upper end of the conveyor as the conveyor is bodily raised, means for bodily raising and lowering the conveyor, and a hopper having a spout detachably connected to the topmost section of the conveyor, for the purposes set forth.

3. In an apparatus of the class set forth, the combination of a conveyor consisting of a series of hollow cylindrical sections detachably connected together and having closed rigid joints at their adjoining ends, a supporting cable and means for connecting it to the lowermost section and detachably to the remaining sections, means for raising and lowering said cable and the attached sections, and means detachably connected to the topmost section for depositing the material to be conveyed thereinto, for the purposes set forth.

4. In a device of the class described, the combination with a conveyor composed of separate sections, with telescoping joints, a slotted car on each section, a cable passing through the slots of all the cars, a latch on each car to confine the cable in the slot, means such as an enlargement of the cable beneath the several cars to prevent the same from drawing through said cars, and a winch upon which the cable may be wound to raise and lower the conveyor.

5. In a device of the class described, the combination, with a conveyor composed of separately-detachable sections rigidly connected together and having their ends telescoped into each other to make a tight joint and enable the conveyor to be shifted bodily laterally and vertically, means for raising and lowering the conveyor, and means for depositing the material to be conveyed into the upper end of the conveyor.

6. In a device of the class described, the combination with a conveyor composed of independently detachable and attachable sections, a spout fitting into the top of the upper section, a hopper connected with the other end of the spout, a cable supporting said conveyor, a winch or drum about which the said cable is wound to hoist or lower the conveyor, and means to permit said spout to fit within the said top-section of the conveyor in the different positions of the conveyor determined by the wrapping of the cable upon, or its unwrapping from, the said winch or drum.

7. In a device of the class described, the combination with a conveyor composed of independently-detachable partially-telescoped sections, a spout fitting into the top section, a hopper connected with the other end of the spout, a cable supporting said conveyor, a drum about which

the said cable is wound to hoist or lower the conveyor, said spool being made extensible by telescoping sections and provided with a rotatable connection with the hopper.

8. In combination with a series of depending supporting-sections detachably connected together, means for raising and lowering said sections and supporting them, of sections of a speaking-tube secured respectively to the sections of said support and adapted to register and connect when said supporting-sections are put together, as and for the purposes set forth.

9. In a device of the class described, the combination with conveyor-sections having slotted lugs or ears, speaking-tube sections secured to said conveyor-sections in similar relation to the said lugs or ears, a cable passing through said lugs or ears to support the conveyor-sections, the said tube-sections registering with each other when the conveyor is so built up.

702,878. LOCKING DEVICE FOR ELEVATORS. MARK E. MCKEIL, JR., Philadelphia, Pa., assignor of one-third to John S. Muckle and Thomas Carpenter Smith, Philadelphia, Pa. Filed Nov. 4, 1901. Serial No. 81,572. (No model.)

Claim.—1. The combination in an elevating mechanism, of a landing, a door, an arm on the door, a car, a plate on the car and a lever pivoted to the car, said lever being in the path of the arm, starting and stopping mechanism, a bolt arranged to engage with said mechanism, means connecting the operating-bolt and the lever, a casing on the plate and a spring-plunger carried thereby in engagement with the lever, said plunger being arranged to complete the movement of the lever when this is moved by the opening of the landing-door, together with means for limiting the motion of the lever, substantially as described.

2. The combination in an elevator, of the landing, a door at the landing having an arm, a car, a lever pivoted to the car and having two arms arranged to be engaged by the arm on the door, starting and stopping mechanism on the car, a bolt arranged to engage the said return, a connection between the bolt and the said lever, the lever having a projecting hub portion provided with two bearing-faces one at an angle to the other, a spring-plunger arranged to bear against either of said faces, bearing against one face when the door is opened and bearing against the other face when the car-door is closed, substantially as described.

3. The combination of an elevator, a landing, a door at the landing, an arm projecting from the door, a car, starting and stopping mechanism on the car, a locking-bolt arranged to engage the starting and stopping mechanism, a plate on the bottom of the car, a lever pivoted to said plate and connected to the locking-bolt, said lever having two bearing-faces one at an angle to the other and joining on a center line through the lever, a casing on the plate, a plunger in said casing having a head arranged to bear against either one or the other of the said bearing-surfaces of the lever, a spring back of the plunger within the casing, and a reservoir back of the spring, substantially as described.

702,874. AIR SUPERHEATER OR CARBURETOR. HARRY H. MCGILL, Pittsburg, Pa., assignor to Pittsburg Gas Engine Company, Pittsburg, Pa. Filed Mar. 7, 1902. Serial No. 97,979. (No model.)

Claim.—1. A device of the character as described, consisting of a heating-chamber, a sphere located in said chamber and adapted to deflect the elements as they are introduced into the chamber against the walls of the same.

2. An apparatus of the character as described, consisting of a heating-chamber, a deflector means located within said chamber, a valve-casing connecting said chamber, said casing having an inlet, a hollow needle-valve located in said casing and a means for adjusting said valve.

3. A device of the character as described, consisting of a heating-chamber, a deflector located in the interior of said chamber, a valve-casing connecting said chamber, said valve-casing having an inlet, a hollow needle-valve located within the casing and a means for adjusting said

needle-valve with relation to the casing to regulate the capacity of the opening into the chamber.

4. A device of the character as described, consisting of a heating-chamber, a deflector located in said chamber, a means for introducing an element into the chamber against said deflector, a coil connected with said chamber and located above the heating means, a reservoir being connected with said coil and also being located above said heating means.

5. A device of the character as described, consisting of a heating-chamber, a deflector located in said chamber, a valve-casing entering said chamber, said valve-casing having an inlet a hollow needle-valve located within said casing and a means for adjusting said needle-valve, a coil connected with said chamber being located above the heating means, a reservoir surrounded by said coil, and also being located above the heating means and being connected to said coil.

702,875. GAS-ENGINE. FRANK L. HENCKA, Brooklyn, N. Y., assignor of one-half to Walter W. Rootwick, Brooklyn, N. Y. Filed Oct. 13, 1900. Serial No. 23,912. (No model.)

Claim.—1. In an internal-combustion motor in combination, a casing, an admission-valve, an air-supply, a fuel-supply, a working piston, exhaust-ports adjacent thereto and controlled thereby, an annular compression-chamber within the casing and around the working piston, an air-passage from said chamber through the piston-head and to the exhaust-ports, and means to control the same.

2. In an internal-combustion motor in combination, a casing, an admission-valve, an air-supply, a fuel-supply, a working piston, exhaust-ports adjacent thereto and controlled thereby, an annular compression-chamber within the casing and around the working piston, an air-passage from said chamber through the piston-head and to the exhaust-ports, the working piston being the valve therefor.

3. In an internal-combustion motor in combination, a casing, an admission-valve, an air-supply, a fuel-supply, a working piston, exhaust-ports adjacent thereto and controlled thereby, an annular compression-cylinder, a piston within said cylinder carried by the working piston, and a passage from the compression-cylinder through the working piston through the combustion-chamber to the exhaust-ports, and means to control the same.

4. In an internal-combustion motor in combination, a casing, an admission-valve, an air-supply, a fuel-supply, a working piston, exhaust-ports adjacent thereto and controlled thereby, an annular compression-cylinder, a piston within said cylinder carried by the working piston, and a passage from the compression-cylinder through the working piston through the combustion-chamber to the exhaust-ports, the working piston being the valve therefor.

5. In an internal-combustion motor in combination, a casing, an admission-valve, an air-supply, a fuel-supply, a working piston, exhaust-ports adjacent thereto and controlled thereby, an annular compression-cylinder, a piston within said cylinder carried by the working piston, a compression-chamber formed by the crank-casing, an air-passage from the in-

side of said chamber around the compression-piston to the annular compression-cylinder to and through the working piston, combustion-chamber and exhaust-ports, and means to control the same.

6. In an internal-combustion motor, in combination, a casing, an admission-valve, an air-supply, a fuel-supply, a working piston, exhaust-ports adjacent thereto and controlled thereby, an annular compression-cylinder, a piston within said cylinder carried by the working piston, a compression-chamber formed by the crank-casing, an air-passage from the inside of said chamber around the compression-piston to the annular compression-cylinder to and through the working piston, combustion-chamber and exhaust-ports, said ports and passages being within the casing, the pistons acting as a valve therefor.

7. In an internal-combustion motor, a casing, exhaust-ports and air-passages therein, means comprising a working piston and a pump-piston integral therewith and of larger diameter, said means casing with said ports and passages as a valve therefor.

8. In an internal-combustion motor in combination, a closed casing, exhaust-ports and air-passages therein, means comprising a working piston, a combustion-chamber in the head thereof, and a compression-piston, an air-passage through the working piston, said means casing with the casing as a valve for the several ports and passages.

9. In an internal-combustion motor in combination, a closed casing, exhaust-ports and air-passages therein, means comprising a working piston, a combustion-chamber in the head thereof, and a compression-piston, an air-passage through the head of the working piston communicating with the combustion-chamber therein, said means casing with the casing as a valve for the several ports and passages.

10. In an internal-combustion motor in combination, a casing, exhaust-ports and air-passages therein, a working piston movable therein and controlling said exhaust-ports, an air-passage through the piston communicating with an annular cylinder around the piston, means for compressing the air in the space below the piston, an air-passage from said space communicating with the annular cylinder, and a valve for said air-passage.

11. In an internal-combustion motor in combination, a casing, exhaust-ports and air-passages therein, a working piston movable therein and controlling said exhaust-ports, an air-passage through the piston communicating with an annular cylinder around the piston at each end of the piston, means for compressing the air in the space below the piston, said means acting as a valve for said air-passage.

12. In an internal-combustion motor in combination, a working cylinder, a compression-cylinder, an air-compressing space formed by the crank-casing, a working piston, a compression-piston said piston acting as a valve controlling the ports from the crank-casing and also as a means for compressing air within the compression-cylinder.

13. In an internal-combustion motor in combination, a working cylinder, a compression-cylinder, an air-compressing space formed by the

crank-casing, a working piston, a compression-piston said piston acting as a valve controlling the ports from the crank-casing and also as a means for compressing air within the compression-cylinder, an air-storage tank and an air-passage between said tank and compression-cylinder, and a check-valve in said passage.

14. In an internal-combustion motor, in combination, a crank-casing, a working cylinder, a compression-cylinder of larger diameter with their corresponding pistons, ports from the compression-cylinder to the working cylinder and to a fuel-supply, and a port from said compression-cylinder to the crank-casing whereby said compression-cylinder is in conjunction with the ports forms the means of communication between the crank-casing and the working cylinder and also the means for compressing air to supply the engine with fuel.

15. In an internal-combustion motor in combination, a casing comprising, with their respective ports and passages, a working cylinder, a compression-cylinder, a crank-casing, movable means within said cylinders for controlling said ports, an admission-valve in the head of said working cylinder and located in the path of both the fuel and compressed-air supply and controlling the admission of the same into the working cylinder.

16. In an internal-combustion motor in combination, a casing comprising a working cylinder, a compression-cylinder, a crank-casing with their several ports and passages, a compound piston common to both cylinders, a combustion-chamber formed in the head thereof, an admission-valve located in the head of the working cylinder and communicating directly with the combustion-chamber and in the path of both the fuel and air supply and controlling the admission of the same to the combustion-chamber.

17. In an internal-combustion motor, the combination of the casing, the cooling device, the working piston, the combustion-chamber in the head thereof, an igniter, means for admitting fuel, an air-storage tank connected to said means, and means by which the piston furnishes air to said tank and for removing the spent charge.

18. In an internal-combustion motor in combination, a casing, a cooling device, means for admitting fuel-supply, an igniter device, a combustion-chamber formed in the head of the working piston, means within the casing for compressing air, means within the casing for removing the spent charge, means within the casing for pumping air to a supply-tank for supplying fuel to the engine, means for supplying air for the compression and for the pump.

19. In an internal-combustion motor in combination, a casing, a cooling device, means for admitting fuel-supply, an igniter device, a combustion-chamber formed in the head of the working piston, combining means for compressing air and for pumping air to a supply-tank for supplying fuel to the engine, a means for removing the spent charge, and a means for supplying air for the compression and for the pump.

20. In an internal-combustion motor in combination, a casing, a cooling device, a fuel-supply, means for injecting and atomizing fuel, an igniter device, a combustion-chamber formed in the head of the working piston, means for compressing air, means for removing the spent charge, means for pumping air to a supply-tank for supplying fuel to the engine, means for supplying air for the compression and for the pump.

702,876. RIBBON-CAP MACHINERY. LAWRENCE A. BORTER, Maywood, Ill., assignor, by mesne assignments, to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 22, 1900. Serial No. 98,994. (No model.)

Claim.—1. In a machine for bending sheet-metal disks or caps with solder, the combination with a ribbon-solder-feed device, of an inner pair of solder-ring cutting and forming dies, an outer pair of solder-ring cutting and forming dies, a cap or disk feed-chute and feeder, a cap-guide-ring, movable between plates thereof, solder ring and cap connecting dies or fingers, a transverse guide and cap-registering guide, removable guide-plates thereof, and a pair of folder-dies, substantially as specified.

2. The combination with a ribbon-solder-feed device or a cap-feeder, a pair of inner solder-ring-cutting dies, a pair of outer solder-ring-cutting dies, and a pair of hammer or folder dies, substantially as specified.

3. The combination with a ribbon-solder-feed device, of solder-ring-cutting dies, a cap feed-chute and feeder, a cap-guide having movable bottom plates, and means for raising the cap and solder ring, substantially as specified.

4. The combination with a ribbon-solder-feed device, of solder-ring-cutting dies, a cap feed-chute and feeder, a cap-guide having movable bottom plates, means for retracting said movable bottom plates, and means for raising the cap and solder ring, substantially as specified.

5. The combination with a ribbon-solder-feed device, of solder-ring-cutting dies, a cap feed-chute and feeder, a cap-guide having movable bottom plates, and hammer or folder dies, substantially as specified.

6. The combination with a ribbon-solder-feed device, of a cap feed-

chute and feeder, a lower die-plate, an upper or reciprocating die-plate, a pair of inner ring cutting and forming dies, a pair of outer ring cutting and forming dies, a cap-guide, a block on the lower die-plate, and movable bottom plates for said guide, a pair of folder-dies, substantially as specified.

7. The combination with a ribbon-solder-feed device, of a cap feed-chute and feeder, a lower die-plate, an upper or reciprocating die-plate, a pair of inner ring cutting and forming dies, a pair of outer ring cutting and forming dies, a cap-guide, a block on the lower die-plate, movable bottom plates for said guide, and a pair of solder-ring-connecting dies or fingers below the lower outer cutting-die, substantially as specified.

8. The combination with a ribbon-solder-feed device, of a cap feed-chute and feeder, a lower die-plate, an upper or reciprocating die-plate, a pair of inner ring cutting and forming dies, a pair of outer ring cutting and forming dies, a cap-guide, a block on the lower die-plate, movable bottom plates for said guide, a pair of solder-ring-connecting dies or fingers below the lower outer cutting-die, and a transverse cap-guideway below said lower outer-die, substantially as specified.

9. The combination with a ribbon-solder-feed device, of a cap feed-chute and feeder, a lower die-plate, an upper or reciprocating die-plate, a pair of inner ring cutting and forming dies, a pair of outer ring cutting and forming dies, a cap-guide, a block on the lower die-plate, movable bottom plates for said guide, a pair of solder-ring-connecting dies or fingers below the lower outer cutting-die, a transverse guideway below said lower cutting-die, and removable guide-plates for said guideway, substantially as specified.

10. The combination with a pair of solder-ring-cutter dies, of a cap-guide having movable bottom plates, and means for uniting the cap and solder ring, substantially as specified.

11. The combination with a pair of solder-ring-cutter dies, of a cap-guide having movable bottom plates, and means for retracting said movable bottom plates, and means for uniting the cap and solder ring, substantially as specified.

12. The combination with a pair of solder-ring-cutter dies, of a cap-guide having movable bottom plates, the upper die having a movable cap holding and centering plunger inside the same, substantially as specified.

13. The combination with a pair of solder-ring-cutter dies, of a cap-guide having movable bottom plates, the upper die having a movable cap holding and centering plunger inside the same provided with an inside centering-plunger engaging the vent-hole of the cap, substantially as specified.

14. The combination with a pair of solder-ring-cutter dies, a cap feed-chute and feeder, a cap-guide having movable bottom plates, a transverse guideway for the caps, and a pair of bending or folding dies, substantially as specified.

15. The combination with a pair of solder-ring-cutter dies, a cap feed-chute and feeder, a cap-guide having movable bottom plates, a transverse guideway for the caps, a pair of bending or folding dies, and a pair of solder-ring connecting or attaching dies or fingers, substantially as specified.

16. The combination with a pair of solder-ring-cutter dies, a cap feed-chute and feeder, a cap-guide having movable bottom plates, a transverse guideway for the caps, a pair of bending or folding dies, a pair of solder-ring connecting or attaching dies or fingers, and a cap guide or registering device furnished with upper movable guide-plates, substantially as specified.

17. The combination with an upper movable die-plate, provided with cap-plugs, of a cap-guide ring having movable bottom plates provided with caps or projections engaged by the cap-plugs on the upper die-plate, and a lower die-plate substantially as specified.

702,877. OIL-BURNER. JAMES R. PAYNE, Hartford, Cal., assignor to Hartford Oil Burner Company, Limited, a partnership. Filed Apr. 17, 1901. Serial No. 64,194. (No model.)

Claim.—1. The combination in an oil burner of a horizontal base plate having a draft-opening, a vaporizer consisting of a plurality of substantially flat parallel plates separated from each other to form a plurality of compartments, means whereby one compartment is made to communicate with another near one end of the plates, a supply-pipe entering one of said compartments, a discharge-opening in the lower portion of the final compartment, and a deflecting-plate substantially parallel with and separated from the final plate of the vaporizer, and rising above the base-plate so as to inclose the lower portion of the vaporizer said deflecting-plate having its sides diverging upwardly from the lower portion.

2. The combination in an oil-burner of a base-plate, said vaporizer consisting of three parallel plates bolted together at the edges said edges separated by interposed packing whereby the chamber is divided into two compartments, perforations in the upper part of the central partition by which the two compartments are connected, a feed-pipe entering one of said compartments, a discharge-opening in the lower portion of the other compartment, the said central plate being longer than the other whereby it is projected through the draft-opening in said base-plate and projected below said plate, and a deflecting-plate extending upwardly from said draft-opening to form a draft-flue.

3. The combination with a base-plate adapted to occupy substantially the position of a grate-bar in a combustion-chamber, and provided with a draft-opening, of a vaporizer rising from and inclined in relation to said base-plate and consisting of a plurality of flat plates and means separating them to form a plurality of compartments said compartments communicating one with the other at the upper portions of the plates and one of said plates extending below the others and into the line of draft, and a deflecting-plate rising from the draft-opening and forming substantially an inclosing housing for the lower portion of the vaporizer said deflecting-plate separated from the front and sides of the vaporizer to form a draft-passage.

702,878. CARBURETER. PAUL ROSENBERG and ALB. ORR, Chicago, Ill.; said Rosenberg assignor, by mesne assignments, of his right to Burton R. Rosen, Chicago, Ill. Filed Apr. 26, 1901. Serial No. 57,468. (No model.)

Claim.—1. In a gas-generator of the character described, the combination of a reservoir and a mixing-chamber connected therewith and provided with a gas-discharge opening, a compressed-air holder opening into said mixing-chamber, an air-tube within and discharging into said holder and adapted to be connected with an air-compressor, and a supply-tube for liquid fuel leading from said reservoir into the mixing-chamber.

2. In a gas-generator of the character described, the combination of a reservoir for liquid fuel and a mixing-chamber connected therewith and provided with a gas-outlet adapted to be connected with a pyrographical or other hand tool, a compressed-air holder in said reservoir, discharging into said mixing-chamber, an air-tube adjustably confined in said holder and forming with its discharge-opening a valve device, said tube being adapted to be connected with an air-compressor, and a supply-tube for liquid fuel leading from said reservoir into the mixing-chamber.

3. A gas-generator of the character described, formed of tubular sections coupled endwise together, one section forming a reservoir for liquid fuel and being closed at its opposite ends, an air-pipe passing through a mixing-chamber closed at its opposite ends, an air-pipe passing through

said reservoir and opening into said mixing-chamber and adapted to be connected at one end with an air-compressor, a supply-tube for the liquid fuel leading from said reservoir into said mixing-chamber and open therein to the compressed air discharged from said air-tube, and a gas-discharge opening in the mixing-chamber adapted to be connected with a pyrographical or other tool.

4. A gas-generator of the character described, formed of tubular sections coupled endwise together, one section forming a reservoir for liquid fuel and being closed at its opposite ends, and the other section forming a mixing-chamber closed at its opposite ends and provided at its outer end with a gas-discharge opening having a gas-neck extension for a rubber-tube connection with a pyrographical or other tool, an air-pipe passing through said reservoir and opening into said mixing-chamber and adapted to be connected at one end with an air-compressor, and a supply-tube for the liquid fuel leading from said reservoir into said mixing-chamber and open therein to the compressed air discharged from said air-tube.

5. A gas-generator of the character described, comprising sections A' and A'' coupled endwise together and forming, respectively, a reservoir for liquid fuel and a mixing-chamber, an air-pipe passing through said reservoir and opening into said mixing-chamber and adapted to be connected at one end with an air-compressor, a needle-valve device in said air-pipe at its communication with said mixing-chamber, and a supply-tube for the liquid fuel leading from said reservoir into said mixing-chamber.

6. A gas-generator of the character described, comprising sections A' and A'' coupled together and forming, respectively, a reservoir for liquid fuel and a mixing-chamber, an air-pipe passing through said reservoir and terminating at its inner end in a minute opening leading into the base of the mixing-chamber, an air-pipe extending through and adjacently connected with said air-pipe and terminating at its inner end in a needle-valve point to form with said opening a needle-valve, said air-pipe having one or more openings P, a tube leading from said reservoir into said mixing-chamber, and a gas-discharge opening in the outer end of said mixing-chamber.

7. A gas-generator of the character described, comprising sections A' and A'' coupled together and forming, respectively, a reservoir for liquid fuel and a mixing-chamber, an air-pipe passing through said reservoir and terminating at its inner end in a minute opening leading into the base of the mixing-chamber, said pipe being threaded about its protruding end, a hollow nipple covered upon the protruding end of said pipe and carrying therein an air-pipe terminating at its inner end in a needle-valve point P and provided with one or more openings P', a tube leading from said reservoir into said mixing-chamber, and a gas-discharge opening in the outer end of said mixing-chamber.

702,879. WRITING-MACHINE CARRIAGE. JOHN T. SHAW, Washington, D. C. Filed Apr. 14, 1902. Serial No. 102,224. (No model.)

Claim.—1. In a type-writing machine the combination of the carriage, a platen-carrier and means for connecting the platen-carrier with the carriage comprising a shaft journaled in bearings on the platen-carrier, supports fast on the shaft adapted to roll relatively to the carriage and flexible connections each secured at one end to the carriage and at the other end to one of the supports substantially as described.

2. In a type-writing machine the combination of a carriage, a platen-carrier and means for connecting the platen-carrier with the carriage comprising a shaft journaled in bearings on the platen-carrier, supports fast on the shaft adapted to roll relatively to the carriage and flexible connections each secured at one end to the carriage and at the other end to one of the supports substantially as described.

3. In a type-writing machine the combination of a carriage, a platen-carrier and means for connecting the platen-carrier with the carriage comprising a shaft journaled in bearings on the platen-carrier, supports fast on the shaft adapted to roll relatively to the carriage and a pair of flexible connections for each of the supports, one end of each of the flexible connections being secured at one end to the carriage and at the other end to one of the supports substantially as described.

4. In a type-writing machine the combination of a carriage, a platen-carrier and means for connecting the platen-carrier with the carriage comprising a shaft journaled in bearings on the platen-carrier, supports fast on the shaft adapted to roll relatively to the carriage and flexible connections each secured at one end to the carriage and at the other end to one of the supports, and a bracket secured to the carriage having an arm extending over the shaft substantially as described.

5. In a type-writing machine the combination of a carriage, a platen-carrier and means for connecting the platen-carrier with the carriage comprising a shaft journaled in bearings on the platen-carrier, supports fast on the shaft adapted to roll relatively to the carriage and flexible connections each secured at one end to the carriage and at the other end to one of the supports, and stops carried by the carriage for limiting the movement of the platen-carrier substantially as described.

6. In a type-writing machine and in combination, a carriage, a platen, a transversely shifting and tilting platen-carrier, a supporting member for the latter, and flexible connecting devices associated with each end thereof for imparting a uniform rotary movement to said ends in the shifting of said carrier, the said rotation of said member controlling the movement of the carrier, whereby the alignment of the same is maintained.

702,880. BATHING-TUB. HERMAN SCHULZ, Cumboldt, by Dresden, Germany. Filed Oct. 3, 1901. Serial No. 77,498. (No model.)

Claim.—A bath-tub, the bottom and one end of which are defined by an unbroken curve, and an approximately crescent-shaped plate in said tub having a semicylindrical foot on its under side located at one side of the center of gravity of said plate and the rear upper side of said plate being located normally above the upper edge of the bath-tub, whereby said plate is adapted to receive the back and shoulders of a man.

702,881. HAND-WHEEL. EDWARD H. SEDGWICK, Brookline, England. Filed Jan. 7, 1902. Serial No. 68,766. (No model.)

Claim.—A hand-wheel consisting of the combination of an annular rubber tube of a given diameter and having an inflating-valve, an annular rubber extension of smaller diameter on the inner periphery of the first-named tube, the cross-section of the tube with its extension being

approximately pear-shaped, and a metallic rim for said wheel, a plane smaller extension *c'* on the smaller rubber extension fitting upon said rim, a metal annulus, and fastening device for clamping said annulus and extension *c'*, to said rim.

702,882. APPARATUS FOR USE IN THE PRODUCTION OF TEXTILE FIBERS OR FILAMENTS FROM SOLUTIONS OF GELATINE OR OF OTHER MATERIAL FROM WHICH FIBERS OR FILAMENTS CAN BE FORMED, AND FOR TWISTING AND PUTTING INTO COIL FIBERS SUCH OR OTHER FIBERS OR FILAMENTS. CHARLES F. TURNER, Lew, England, assignor to James Yates Johnson, London county, England. Filed Jan. 15, 1901. Serial No. 63,412. (No model.)

Claim.—1. In apparatus for forming fibers, or filaments, from solutions of gelatine, or other material, a plug having a passage extending therethrough communicating with grooves in its external surface, a filtering medium covering the plug, a cap or isolating casing for the plug, and a forming-nozzle connected to the discharge-opening of said casing.

2. In apparatus of the kind described, a nozzle-pipe, a perforated cup-like forming-nozzle having a flange for removably connecting it to the nozzle-pipe.

3. In apparatus of the kind described, a filter and its isolating cap or casing, a nozzle-tube projecting into said cap or casing so as to leave an air-space about its inwardly-projecting end, and a forming-nozzle on the nozzle-tube.

4. In apparatus of the kind described, a filter, an isolating casing therefor adapted to be turned about a center, a supply-passage leading into the casing, a nozzle-pipe projecting at one end into the casing, the dimensions of said inwardly-projecting end being less than the internal dimensions of the casing so as to form an air-space about the same, means for allowing the air to be expelled from said space, and a perforated cup-piece or nozzle at the discharge end of the nozzle-pipe.

5. In apparatus for coiling filaments, the combination with a rotatable box having an inwardly-extending projection or overhang about an opening through which the filaments are introduced at the top of the box, means for rotating the box, and means for introducing the filaments through said opening.

6. In an apparatus for coiling filaments, the combination of a filter, a perforated nozzle arranged in close proximity to said filter, a rotatable box provided with a cover having a central aperture therein, means for rotating said box, and means for introducing the filaments through said aperture, substantially as described.

7. In an apparatus for coiling filaments, the combination of a rotatable vessel having a reduced opening in its upper portion, means for rotating said vessel, and means for introducing the filaments through said opening, substantially as described.

702,888. STOP-VALVE. WILLIAM C. TYLER, Philadelphia, Pa., assignor of one-half to Frank Tyler, Philadelphia, Pa. Filed Aug. 7, 1901. Serial No. 11,111. (No model.)

Claim.—1. The combination of a stop-valve located in the inlet-chamber of the valve-chest and having a check-valve projecting therefrom and capable of limited longitudinal movement independently thereof, with a valve-chest having two seats, one for the stop-valve and another, beyond the same, in the direction of the outlet from the chest for the check-valve, substantially as specified.

2. The combination of a stop-valve having a chamber therein, a check-valve projecting from said stop-valve and having a stem with enlarged head contained within the chamber of said stop-valve and having longitudinal play therein, and a valve-casing having a seat for the stop-valve, and, beyond the same, a seat for the check-valve, substantially as specified.

702,884. BRAKE MECHANISM. LUDWIG VAN COTT and JOHN D. KEELY, New York, N. Y. Filed May 12, 1901. Serial No. 63,622. (No model.)

Claim.—1. The combination with a vehicle, of a track-brake, a wheel-brake, mechanism actuated from the vehicle-wheels for setting said brakes, and mechanism including a single line of connection by which both brakes are operated, and means for throwing the setting mechanism into and out of action, substantially as described.

2. The combination with a vehicle of a set of track-brake shoes, a set of wheel-brake shoes, connections between the two sets of shoes whereby as the brakes are applied one set of shoes acts as a fulcrum for the other set of shoes, mechanism actuated from the vehicle-wheels for setting said brakes and mechanism including a single line of connection through which both brakes are operated, and means for throwing the setting mechanism into and out of action, substantially as described.

3. The combination with a vehicle, of a track-brake, a wheel-brake, friction mechanism actuated from the vehicle-wheels for setting said brakes, and mechanism including a single line of connection by which both brakes are operated, and means for throwing the friction mechanism into and out of action, substantially as described.

4. The combination with a vehicle, of a set of track-brake shoes, a set of wheel-brake shoes, connections between the two sets of shoes whereby as the brakes are applied one set of shoes acts as a fulcrum for the other set of shoes, friction mechanism actuated from the vehicle-wheels for setting said brakes, and mechanism including a single line of connection through which both brakes are operated, and means for throwing the friction mechanism into and out of action, substantially as described.

5. The combination with a vehicle, of a track-brake, a wheel-brake, a friction mechanism actuated from the vehicle-wheels for setting said brakes, and mechanism including a single line of connection whereby the brakes are operated, and hand-controlled means for throwing the friction mechanism into and out of action, substantially as described.

6. The combination with a vehicle, of a track-brake, a friction mechanism actuated from the vehicle-wheels for setting said brakes, hand-controlled means for throwing the friction mechanism into and out of action, and connections between the hand-controlled means and the friction

mechanism, said connections including a yielding device, the parts of which have a limited movement with respect to each other and are maintained under tension, substantially as described.

7. The combination with a vehicle, of a track-brake, a wheel-brake, friction mechanism actuated from the vehicle-wheels for setting said brakes, hand-controlled means for throwing the friction mechanism into and out of action, and connections between the hand-controlled means and the friction mechanism, said connections including a yielding device, the parts of which have a limited movement with respect to each other and are maintained under tension, substantially as described.

8. The combination with a vehicle, of a track-brake, a friction mechanism actuated from the vehicle-wheels for setting said brakes, hand-controlled means for throwing the friction mechanism into and out of action, connecting means between said hand-controlled means and said friction mechanism, and a connection including a spring maintained under tension and the parts of which have a limited movement with relation to each other located in said connecting means, substantially as described.

9. The combination with a vehicle, of a track-brake, a wheel-brake, a friction mechanism actuated from the vehicle-wheels for setting said brakes, hand-controlled means for throwing the friction mechanism into and out of action, connecting means between said hand-controlled means and said friction mechanism, and a connection including a spring maintained under tension and the parts of which have a limited movement with relation to each other located in said connecting means, substantially as described.

10. The combination with a vehicle, of a set of brake-shoes operating upon the track on which the vehicle runs, a set of brake-shoes operating upon the wheels of the vehicle, a friction mechanism actuated from the vehicle-wheels, hand-operated connections for throwing the friction mechanism into operation, and a single line of setting connections between the friction mechanism and the sets of brake-shoes, substantially as described.

11. The combination with a vehicle, of a set of brake-shoes operating upon the track upon which the vehicle runs, a set of brake-shoes operating upon the wheels of the vehicle, connections between the sets of shoes whereby one set acts as a fulcrum for the other set, a friction mechanism actuated from the vehicle-wheels, hand-operated connections for throwing the friction mechanism into operation, and a single line of setting connections between the friction mechanism and the sets of brake-shoes, substantially as described.

12. The combination with a vehicle, of a pair of brake-shoes operating upon the track on which the vehicle runs, a pair of brake-shoes operating upon the wheels of the vehicle, a pair of bell-cranks levers, each

of said levers operating a track-brake shoe and a wheel-shoe, a shaft to which the bell-cranks levers are connected, a crank-lever, connections between said lever and the shaft, a friction-plate mounted on one of the ends of the crank of the vehicle, and hand-operated connections by which the friction-plate is thrown into action and the brakes set, substantially as described.

702,885. LEVER-FASTENING FOR GLASSES. HENRY H. WATTS, Brooklyn, N. Y., assignor to Charles F. Wall, trading as the firm of Wall and Onda, Philadelphia, Pa. Filed June 21, 1901. Serial No. 63,422. (No model.)

Claim.—1. In a fastening for frame and lens of glasses, the combination with the lens, two arms adapted to lie upon opposite sides of the lens and a removable securing member passing through the lens and binding the arms thereto, of a removable sleeve surrounding the securing member within the side faces of the lens, said sleeve and an arm having interlocking irregularities to prevent the sleeve from turning.

2. In a fastening for frame and lens of glasses, the combination with the lens and arms adapted to be on opposite sides of the lens, said lens and arms having registering holes, of a separable sleeve passing through the hole in one arm and the lens, a securing member passing through the sleeve and binding the arms upon the lens, and means for preventing said sleeve from turning.

3. In a fastening for frame and lens of glasses, the combination with the lens and arms adapted to be on opposite sides of the lens, of a separable sleeve passing through one arm and the lens, and a screw passing through said sleeve and engaging the two arms to bind them upon the lens and means for preventing said sleeve from turning.

4. In a fastening for frame and lens of glasses, the combination with the lens and arms adapted to embrace the lens, of a separable sleeve passing through one arm and the lens, said sleeve and an arm having interlocking irregularities preventing the sleeve from turning, and a securing member passing through said sleeve and engaging the arms to bind them upon the lens.

5. In a fastening for frame and lens of glasses, the combination with the lens and arms adapted to embrace the lens, of a sleeve passing through one arm and the lens and having a flange on its outer end engaging the arm to limit its insertion, said sleeve and one arm having interlocking irregularities preventing the sleeve from turning, and a screw passing through the sleeve and engaging the opposite arm to bind the arms upon the lens.

6. In a fastening for frame and lens of glasses, the combination with the lens, and arms extending from the frame and adapted to engage the opposite sides of the lens, said arms and lens having registering holes, of a screw adapted to pass through said arms and lens, and a nut therefor independent of the arms and having a sleeve extending through one arm and interposed between said screw and lens, and means for engaging said nut with its engaged arm to prevent its turning.

7. In a fastening for frame and lens of glasses, the combination with the lens and arms adapted to embrace the lens, said arms and lens having screw-receiving holes adapted to register, of a screw, a sleeve not therefor adapted to be interposed between screw and lens and having a flange or head at one end and non-circular in outline, one of the arms having a recess in its inner surface adapted to receive said head.

8. In a fastening for frame and lens of glasses, the combination with the lens and arms adapted to engage opposite sides of the lens, said lens and arms having registering holes, of an interiorly-threaded removable sleeve having a head or flange on one end and adapted to pass through the hole in one arm and the lens and to enter the hole in the other arm, a screw engaging by its head the arm opposite that engaged by the head of the sleeve and screwing into said sleeve, and means for preventing turning of said sleeve.

702,886. COW-MILKER. DAVID T. WILSON, Cochransville, Pa., assignor of one-half to Robert Hamill, Cochransville, Pa. Filed June 12, 1901. Serial No. 63,173. (No model.)

Claim.—1. In a cow-milker, the combination with the body having open-sided teat-receiving recesses in its opposite side faces, of pressure elements pivoted to the body and extending across the open sides of the recesses, and operating levers located between and having opposite connections with each of the pressure elements for simultaneously and positively moving those of one set into and those of the other set out of their respective recesses.

2. In a cow-milker, the combination with a body having teat-receiving recesses, of movable pressure devices operating in said recesses, and means for operating the pressure devices, said means having independent detachable connections with outside of said devices.

3. In a cow-milker, the combination with a body having open-sided recesses in its opposite faces, of pressure elements pivoted upon the body and movable out of and into the recesses through their open sides, a shaft mounted upon the body, and separate connections between the shaft and each of the pressure elements to positively move them out of and into the recesses on the movement of the shaft.

4. In a cow-milker, the combination with a body having test-receiving recesses in its opposite faces, of pressure elements movably mounted upon the body and movable out of and into the recesses, a shaft mounted longitudinally upon the body between the opposite recesses, and connections between the shaft and the pressure elements.

5. In a cow-milker, the combination with a body having test-receiving recesses in its opposite faces, of pressure elements movably mounted upon the body and movable out of and into the recesses, a shaft mounted upon the body, and independent detachable connections between the shaft and the pressure elements.

6. In a cow-milker, the combination with a body having test-receiving recesses in its opposite faces, of independent pressure elements movably mounted upon the body and movable out of and into their respective recesses, a shaft mounted upon the body, and an independent detachable connection between the shaft and each pressure element.

7. In a cow-milker, the combination with a body having test-receiving recesses in its opposite faces, of pressure elements movably mounted upon the body and movable out of and into the recesses, a rock-shaft also mounted upon the body and having crank-arms, and an independent detachable connection between the crank-arms and each pressure device.

8. In a cow-milker, the combination with a body having recesses in its opposite faces, of pressure-plates pivoted to the body and carrying yielding blocks that are movable into and out of the recesses, a rock-shaft mounted upon the body between the recesses and having crank-arms, and latches connecting the plates and the crank-arms.

9. In a cow-milker, the combination with a body having recesses in its opposite faces, of pressure-plates pivoted to the sides of the body and between the recesses thereof, carrying yielding blocks that are movable into and out of said recesses, a rock-shaft journaled upon the body and having crank-arms, and latches pivoted to the crank-arms and detachably engaging the free ends of the plates.

10. In a cow-milker, the combination with a body having spaced test-engaging elements, of a rigid udder-praising device located upon the body between the test-engaging elements, and yielding supporting means connected to the body for supporting the same in operative relation to a cow's udder.

11. In a cow-milker, the combination with a body having spaced test-engaging elements, of a rigid udder-praising device located upon the body between the test-engaging elements and projecting above the upper face of the same, and means for yieldingly suspending the body in operative relation to a cow's udder.

12. In a cow-milker, the combination with a body having spaced test-engaging elements, of an udder-praising device located upon the body between the test-engaging elements and projecting above the upper face of the same, and yielding supporting means connected to the body and arranged to engage a cow to hold said body in operative relation to the udder thereof.

13. In a cow-milker, the combination with a body having spaced test-engaging elements, of a rigid udder-praising device located upon the body between the test-engaging elements and projecting above the upper face of the same, straps secured to the body and arranged to pass over the cow, and yielding devices interposed in said straps.

14. In a cow-milker, the combination with a body having spaced test-engaging elements, of a rigid udder-praising device located upon the body between the test-engaging elements and projecting above the upper face of the same, straps arranged to pass over the cow, and coiled springs interposed between and secured to the ends of the straps and the body.

15. In a cow-milker, the combination with a body, of test-engaging

devices carried by the body, a positioning-frame pivotally connected to the body and arranged when in operative position to engage the under side of a cow, and means for holding said frame in operative position.

16. In a cow-milker, the combination with a body, of test-engaging devices carried by the body, a positioning-frame comprising a body-band having hinge-eyes that are pivoted to the body, and a strap arranged to surround a cow, and having a detachable connection with one end of the body-band.

17. In a cow-milker, the combination with a body, of test-engaging devices carried by the body, and leg-engaging arms also carried by the body and arranged to engage the front portions of a cow's leg to prevent kicking.

18. In a cow-milker, the combination with a body, of test-engaging devices carried by the body, plates pivoted to the body, a strap arranged to surround a cow and connected to the free ends of the plates, and leg-engaging arms secured to the plates and arranged to engage the front portions of a cow's legs to prevent her kicking.

19. In a cow-milker, the combination with a body having open-ended test-receptacles, of a milk-receiving funnel located beneath the body and having openings in its side walls, and spring-latches carried by the body and engaging in the openings of the funnel.

20. In a cow-milker, the combination with a body having recesses in its opposite sides, of yielding pressure-blocks having a pivotal connection with the body and movable into and out of the recesses, said blocks tapering from their upper toward their lower ends and having their inner faces disposed in inclined relation to the opening walls of the recesses.

21. In a cow-milker, the combination with a body having open-sided test-receiving recesses and ears located between the recesses, of pressure elements pivoted to the ears and extending in opposite directions across the recesses, and means connected to the outer ends of the pressure elements to move them into and out of said recesses.

22. In a cow-milker, the combination with a body having recesses in its opposite faces, of pressure-plates pivoted to the sides of the body between the recesses thereof, and carrying yielding blocks that are movable into and out of said recesses, a rock-shaft journaled upon the body and having crank-arms, latches pivoted to the crank-arms and detachably engaging the free ends of the plates, and spring-pressed bolts mounted upon the latches to hold the same in operative position to lock the same to the plates.

702,387. CLINICAL THERMOMETER. JAY F. WINDOLPH and RICHARD C. STUTER, New York, N. Y. Filed Dec. 4, 1901. Serial No. 84,892. (No model.)

Claim.—1. A clinical thermometer, comprising a casing for containing an antiseptic solution, and provided with a head screwing on the open end of the said casing, a diaphragm held on the upper edge of the casing and engaged by an annular shoulder on the head to securely hold the diaphragm in position, and a cap screwing in the mid head and in which the upper end of the thermometer is rigidly secured, as set forth.

2. A clinical thermometer, comprising a casing for containing an antiseptic solution, and provided with a head screwing on the open end of the said casing, a diaphragm held on the upper edge of the casing and engaged by an annular shoulder on the head to securely hold the diaphragm in position, the head having an opening for the passage of a thermometer and a vent for the air from the casing, and a cap screwing in the mid head and in which the upper end of the thermometer is rigidly secured, as set forth.

3. A clinical thermometer, comprising a casing for containing an antiseptic solution, and provided with a head screwing on the upper end of the said casing, a diaphragm held on the upper edge of the casing and engaged by an annular shoulder on the head to securely hold the diaphragm in position, the latter having an opening for the passage of the thermometer, a valve integral with the diaphragm for normally closing the said opening, the valve being adapted to open downwardly on inserting the thermometer, and a cap screwing in the mid head and in which the upper end of the thermometer is rigidly secured, as set forth.

4. A clinical thermometer, comprising a casing for containing an antiseptic solution, and provided with a head screwing on the open end of the said casing, a diaphragm held on the upper edge of the casing and engaged by an annular shoulder on the head to securely hold the diaphragm in position, the latter having a central opening, a valve integral with the diaphragm for normally closing the said opening and adapted to open inwardly on inserting the thermometer, the valve sliding into a recess on the under side of the diaphragm to close the opening when the thermometer is withdrawn, and a cap screwing in the mid head and in which the upper end of the thermometer is rigidly secured, as set forth.

5. A clinical thermometer, comprising a casing for containing an antiseptic solution, and provided with a head screwing on the open end of the said casing, a diaphragm held on the upper edge of the casing and engaged by an annular shoulder on the head to securely hold the diaphragm in position, the latter having a central opening, a valve integral with the diaphragm for normally closing the said opening and adapted to open inwardly on inserting the thermometer, the valve sliding into a recess on the under side of the diaphragm to close the opening when the thermometer is withdrawn, and a cap screwing in the mid head and in which the upper end of the thermometer is rigidly secured, as set forth.

6. A clinical thermometer, comprising a casing for containing an antiseptic solution, and provided with a head screwing on the open end of the said casing, a diaphragm held on the upper edge of the casing and engaged by an annular shoulder on the head to securely hold the diaphragm in position, the latter having a central opening, a valve integral with the diaphragm for normally closing the said opening and adapted to open inwardly on inserting the thermometer, the valve sliding into a recess on the under side of the diaphragm to close the opening when the thermometer is withdrawn, and a cap screwing in the mid head and in which the upper end of the thermometer is rigidly secured, as set forth.

702,888. AUTOMATIC SHEET-METAL DISK OR CAP FOLDING MACHINE. JOHN F. WINE, Maywood, Ill., assignor by mesne assignments to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 22, 1900. Serial No. 22,822. (No model.)

Claim.—1. In a machine for automatically folding metal disks or caps, the combination with a tilting or vibrating box or receptacle furnished with a series of discharge-cripples at one end and provided with a yielding gate permitting the passage of caps or disks which are right side up and arresting those which are wrong side up, and means for slightly opening and relieving the gate when the box is tilted downward thus releasing the arrested caps, a series of chutes or passage-ways for the caps, each provided with a vibrating cap-fed controller permitting the caps to pass along one by one, mechanism for operating said cap-fed controllers successively one after another, a collecting chute or passage-way, and a delivery chute or passage-way provided with a cap-fed controller, substantially as specified.

2. The combination with a tilting box or receptacle furnished with a narrow, horizontally-extending discharge-cripples and a gate, of a series of chutes or passage-ways provided with cap-fed controllers, and means for successively operating the cap-fed controllers, substantially as specified.

3. The combination with a tilting receptacle having a narrow, horizontally-extending discharge-cripples and a yielding gate permitting the passage of disks right side up, and means for slightly opening said gate when the receptacle is tilted downward, substantially as specified.

4. The combination with a tilting box or receptacle having a narrow, horizontally-extending discharge-cripples and a gate furnished with a spring for holding it in its normal position, and provided with a projecting arm, and a stop which said arm engages when the box is tilted downward, substantially as specified.

5. The combination with a tilting box or receptacle having a series of narrow, horizontally-extending discharge-cripples for disks or caps, of a series of chutes or passage-ways, and a collecting-chute, substantially as specified.

6. The combination with a tilting box or receptacle having a series of discharge-cripples for disks or caps, of a series of chutes or passage-ways, a collecting-chute, and a series of cap-fed controllers in said series of chutes or passage-ways, substantially as specified.

7. The combination with a tilting box or receptacle furnished with a narrow, horizontally-extending discharge-cripples, of mechanism for imparting a quick downward or dropping movement and a slow rising movement to said box or receptacle, substantially as specified.

8. The combination with a tilting box or receptacle furnished with a discharge-cripples, of mechanism for imparting a quick downward or dropping movement and a slow rising movement to said box or receptacle, said mechanism comprising a revolving shaft having an arm and a vibrating lever furnished with a curved portion, substantially as specified.

REISSUES.

11,999. STRAIN-TURNER. JOHN J. JONES, Rio Janeiro, Brazil. Filed Dec. 24, 1891. Serial No. 57,228. Original No. 941,074, dated Jan. 8, 1900.

Claim.—1. The combination, in a steam-turbine, of an external fixed cylinder and an internal revolving drum, having their interior and exterior surfaces provided with a series of longitudinal steam-directing blades, and a series of transverse steam-directing partitions intersecting said blades; the blades and partitions terminating centrally between the ends of the cylinder and drum to provide a central annular steam-chamber and the outer edges of said partitions being substantially in line with the outer edges of the blades.

2. The combination, in a steam-turbine, of a fixed cylinder having attached steam-directing blades 23 and partitions 27 on its interior, a revolving drum arranged within said cylinder and having attached steam-directing blades 24 and partitions 29 on its exterior coacting with those on the interior of the fixed cylinder, and steam-ports and a steam-covering valve arranged centrally between the ends of said cylinder and drum and governing all of said ports, to admit steam at the center and exhaust from the opposite ends of the cylinder and drum, or to admit steam at the opposite ends of said cylinder and drum and exhaust from the center thereof, substantially as described.

3. The combination, in a steam-turbine, of a fixed cylinder having an annular steam-chamber centrally between its ends, and a plurality of steam-directing blades and partitions on its interior from the annular steam-chamber to its opposite ends, a revolving drum arranged within the fixed cylinder and having a plurality of steam-directing blades and partitions on its exterior from said annular steam-chamber to its opposite ends, the steam-ports leading from the center of the cylinder to its opposite ends and to said annular steam-chamber, and a steam-covering valve controlling said ports to admit steam direct to the central annular steam-chamber and exhaust from opposite ends of the cylinder and drum or to admit steam to the opposite ends of the cylinder and drum and exhaust from the central annular steam-chamber, substantially as described.

4. The combination, in a steam-turbine, of a fixed cylinder having a set of steam-ports and an annular steam-chamber centrally between its ends, a longitudinal, rotary meter-shaft, a rotary drum arranged on said shaft within the fixed cylinder, and an oscillatory reversing-valve controlling the set of steam-ports at the center of the cylinder and serving to admit steam direct to said central annular steam-chamber and exhaust from opposite ends of the cylinder and drum, or to admit steam to the opposite

ends of the cylinder and drum and exhaust from the central annular steam-chamber, substantially as described.

8. The combination, in a steam-turbine, of an external fixed cylinder and an internal revolving drum having their interior and exterior surfaces provided with a series of longitudinal steam-directing blades, and a series of transverse steam-directing partitions intersecting said blades; the blades and partitions terminating centrally between the ends of the cylinder and drum to provide a central, annular steam-chamber, with a steam-inlet and steam-valve in the cylinder opposite to, or in coincidence with, said central, annular steam-chamber, substantially as described.

12,000. CASH-REGISTER. RALPH F. THORNTON, Springfield, Ohio, assignor to the National Cash Register Co., Dayton, Ohio, a Corporation of Ohio. Filed May 28, 1896. Serial No. 582,885. Original No. 582,884, dated Jan. 22, 1895.

Claim.—1. In a cash-register, the combination with a cover adapted to inclose the keys, a cancel-card and intermediate device connecting the said cover and said card and acting to display the card when the cover is opened.

2. In a cash-register, the combination with a pivoted cover adapted to inclose the keys, cam mechanism, a lever actuated thereby, said cover moving with the cam during at least a part of the latter's motion, and a cancel-card connected to said lever, the cam mechanism including a race adapted to maintain the card displayed until the cover is substantially closed.

3. In a cash-register, the combination with the pivoted cover adapted to inclose the keys, a cam connected with the cover and having a main slot and a branch slot, a pivoted lever engaging with the walls of the slot by a stud and adapted by the movement of the cam to be elevated and lowered at one end and to have said end maintained elevated, and a cancel-card connected with said end.

4. In a cash-register, the combination with a series of keys, and indicators adapted to be displayed by the keys, of a key-cover normally inclosing the keys, and devices intermediate of the cover and keys which operate to return a depressed key to normal position as the cover is opened and before the cover is sufficiently opened to expose the keys.

5. In a cash-register, the combination with a series of keys, a cover normally inclosing them, indicators attached to the keys, and intermediate primer devices arranged to force a depressed key back to normal position by the action of the cover as it is opened.

6. In a cash-register, the combination with a cover adapted to inclose a series of keys, a series of such keys mounted on a pivot, an indicator connected to each of said keys, primer devices and trip devices between the keys and the cover, the cover being adapted to depress the primer devices until each key yields to the opening of the cover and the trip devices permitting the cover to close without being affected by the depressed key.

7. In a cash-register, the combination with a pivoted cover having a plate connected therewith, a series of pivoted keys inclosed by the cover, a rod connected to each key and carrying an indicator, a pivoted primer-bar engaging with the keys and a trip carried by said plate and engaging in one end engaging in the other direction with and from the primer-bar,

the arrangement being such as to depress the keys by the opening of the cover, yet permitting the cover to close while a key remains depressed.

8. In a cash-register, the combination with a cover, a series of keys adapted to be normally inclosed thereby, and exposed on opening the cover, registering mechanism operated by depressing the outer end of the keys, indicators displayed by operating the keys, supporting devices for the keys to maintain any actuated key in actuated position, primer devices for the keys, and intermediate devices which, by opening the cover, release the supporting devices and operate the primer devices, whereby the cover cannot open except by returning the depressed key to normal position and withdrawing the indicator.

9. In a cash-register, the combination with a cover, a series of keys adapted to be normally closed thereby, and exposed on opening the cover, registering mechanism operated by said keys, indicator-cards displayed by said keys, supporting devices for the keys, primer devices therefor, a cancel-card and a lever connected thereto, and intermediate devices which by opening the cover release said supporting devices, actuate said primer devices and display said cancel-card in the proper succession.

10. In a cash-register, the combination with a cover, a series of keys adapted to be normally closed thereby, and to be exposed on opening the cover, indicators displayed by said keys, registering mechanism operated by said keys through pawls which also act to support said keys, stop devices for said pawls, primer devices for said keys, a cancel-card and a lever connected thereto, and devices connected with the cover and adapted to release the operating and supporting pawls, to actuate the primer devices, and return a depressed key to normal position and to actuate said lever to display the cancel-card, all in the proper succession.

11. In a cash-register, the combination with a cover, a series of keys normally covered thereby and exposed on opening the cover, indicators displayed by said keys, a lever and a cancel-card displayed by said lever, and intermediate devices connected with the cover and adapted to press a depressed key back to normal position as the cover is opened and also adapted to actuate said lever, in the proper succession.

12. In a cash-register, the combination with a cover, a series of keys adapted to be normally inclosed thereby, and exposed on opening the cover, an indicator displayed by each key, a primer-bar for the keys, a lever and a cancel-card displayed thereby, a cam, and a trip device connected to said cam and adapted to operate the primer-bar to return a depressed key to normal position as the cover is being opened and to operate said lever, and display a cancel-card in proper succession.

13. In a cash-register, the combination with a cover, a series of keys adapted to be normally inclosed thereby, and exposed on opening the cover, primer devices for the keys, registering mechanism and intermediate devices actuated by the keys to operate said mechanism, a stop bar or device to engage with the said devices between the keys and register mechanism to prevent their disengagement from the latter at the limit of the throw, to prevent "overthrowing" and devices connected to said cover and arranged to release the stop bar or device and to actuate the primer device, whereby on returning a depressed key to normal position the stop bar or device is released.

14. In a cash-register, the following instrumentalities: a cover, a series of keys adapted to be normally inclosed thereby and exposed on opening the cover, an indicator displayed with each key, a primer device for all the keys, a key-pawl for each key and an associated arresting-pawl, register mechanism engaged and operated by each key-pawl, a stop-bar for the key-pawls, a lever, a cancel-card displayed thereby, a money-drawer, locking device therefor and a sounding-gong, a cam-plate connected to the cover and acting to operate the primer-bar, the stop-bar, the drawer lock and gong; the actuation of these several parts being properly timed, whereby a depressed key is made incompressible after registering, whereby each key is pressed back to normal position as a condition to the opening of the cover, whereby the cancel-card is displayed as the indicator is so withdrawn, and whereby "overthrowing" is prevented.

15. In a cash-register, the following instrumentalities: a cover, a series of pivoted keys adapted to be inclosed thereby when closed, and exposed when open, a pivoted primer-bar for all the keys, an indicator for each key, a pawl carried by each key, and register mechanism operated by each of said pawls, an associated arresting-pawl for each key-pawl, a pivoted stop-bar adapted to engage with all of the key-pawls to prevent "overthrowing," a pivoted arm carrying a pivoted trip to actuate the stop-bar, a lever connected with a cancel-card, a drawer, a lock therefor and a sounding-gong, a cam-plate connected with the cover and having a main and branched slot, a pivoted trip and projecting lug and operating a plunger to release the drawer-lock and operate the bell, the said slot, pivoted trip and lug of the cam-plate, respectively opening the said lever the primer-bar and the stop-bar-actuating arm, all substantially as described.

16. In a cash-register, the combination with a series of keys, of a pivoted primer-bar extending across the entire number of keys and having a projection by which it is operated, a cover and intermediate de-

vices between the cover and said projection adapted to move in contact with the latter and move the same, substantially as and for the purpose described.

17. In a cash-register, the combination with a series of registering-wheels, of a series of keys, a key-pawl carried by each key and engaging with the registering-wheel, and a retaining-pawl for each wheel, the key-pawls being adapted to engage with the retaining-pawls and to withdraw the latter from engagement with the wheels when the key-pawls are manually drawn outward, whereby the said wheels may be set back to zero by thus releasing them from engagement with the key-pawls and retaining-pawls.

18. In a cash-register, the combination with a series of keys, and registering mechanism, of a pawl pivoted to each key, extending upward and so engaging with said mechanism as not to slip or slide thereon, and a stop-bar extending across the line of said pawls and arranged to engage with them to prevent their withdrawal from engagement with said mechanism and then dropping down, whereby said pawls are made to act to suspend and hold the keys in operated position.

19. In a cash-register, the combination with a registering mechanism, operating keys and pawls, of a stop-bar located near to said pawls and arranged to come in contact with them on operating device for the stop-bar actuated from outside of the machine-casing, and intermediate device within the casing connecting the outside operating device with the said stop-bar, whereby the stop-bar may be manually moved out of engagement with the pawls.

20. In a cash-register, the combination with the registering mechanism, a series of keys and pawls pivoted to and actuated by the latter and engaging with teeth in the former, of arresting-pawls also engaging with said teeth and a stop-bar arranged to oppose the key-pawls, and prevent their disengagement from said teeth at or about the limit of their throw, whereby "overthrowing" is prevented and the keys are suspended, the arresting-pawls preventing back motion of the registering mechanism.

21. In a cash-register, the combination with registering mechanism consisting in part of a rotatable wheel, and a double-shouldered spring-pawl attached thereto, of a fixed plate having a slot, the double-shouldered pawl being arranged to engage with said plate, substantially as shown and described.

22. In a cash-register, the combination with a series of keys, a pawl connected with each key, a pawl associated with each key-pawl, a spring connecting each key-pawl with its associated pawl and registering mechanism including toothed wheels with which both kinds of said pawls engage, the key-pawls to actuate the wheels and the other pawls to prevent the return movement of the wheels, whereby the keys are suspended as well as the wheels actuated.

23. In a cash-register, the combination with an outer casing, registering-wheel mounted therein, keys and actuating-pawls for operating said registering-wheel, arresting-pawls for preventing the registering-wheel from turning backward, a movable stop-bar for holding the actuating-pawls in engagement with the registering-wheel at the end of the stroke, the movable key-cover and suitable intermediate mechanism for operating the stop-bar to release said actuating-pawl and allow it to engage the succeeding teeth when the cover is opened.

24. In a cash-register, the combination with a series of keys, a key-controller, and a key-primer device, of an operating device, and connecting mechanism between said operating device and said key-controller and key-primer, respectively, whereby a movement of said operating device will press a previously-moved key back to normal position and will permit any of the keys to be moved to indicating position.

25. In a cash-register, the combination with a series of keys, a key-controller, and a key-primer device, of an operating device, a plate connected to said operating device a trip carried by said plate and adapted to act on the primer in one movement of the plate but not on the other movement, and a connection between said plate and key-controller which acts on the latter after said action on the primer.

26. In a cash-register, the combination with a series of keys, of a key-controller, an operating device, and connecting mechanism between said operating device and said controller, whereby one movement of said operating device will permit any of said keys to be moved to indicating position, and another movement thereof will prevent any of said keys from being moved while any key is still in indicating position.

27. In a cash-register, the combination, of a series of keys, a key-controller, an operating-lever, and a connection between said lever and said controller which acts on the latter to move it relatively to the keys by the movement of the lever so that one movement of said controller will permit any of said keys to be moved to indicating position and another movement thereof will prevent any of said keys from being moved while any key is still in operating position.

28. In a cash-register, the combination of a series of keys, a key-controller, an operating-lever, a plate connected to said lever, and a con-

nection between said plate and a key-controller which acts on the latter to move it relatively to the keys by the movement of the lever.

29. In a cash-register, the combination of a series of keys, a key-primer, an operating device, and connecting mechanism between said primer and operating device whereby one movement of said operating device will press any key in indicating position back to normal position, and means for locking the keys in their operated position when the machine is in normal position.

30. In a cash-register, the combination with a series of keys, a key-primer extending across said series of keys, an operating-lever, and a connection between said lever and said primer, whereby one movement of the lever will press said primer against any key in indicating position and return it to normal position, and means for locking the keys in their operated position when the machine is in normal position.

31. In a cash register and indicator, the combination of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, means controlled by an independent lever or handle for preventing operation of the key-levers while said lever or handle is in normal position, means for temporarily holding the key-levers in depressed position when moved thereto after the handle or lever has been moved from normal position to permit their operation, and means cooperating with said handle or lever for releasing the depressed key-levers upon the next succeeding movement of said handle or lever, whereby operation of the key-levers is prevented until said handle is moved from normal position, and whereby the key-levers are temporarily held in depressed position after being operated subsequent to the movement of the handle from normal position, and whereby the operated key-levers are released and returned to normal position upon the next succeeding movement of said handle from normal position.

32. In a cash register and indicator, the combination of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, means controlled by an independent handle or lever for preventing operation of the key-levers while said handle or lever is in normal position, means for temporarily holding the operated key-levers in depressed position when operated subsequent to the movement of the handle from normal position, and means controlled by said handle for releasing the operated key-levers and positively returning them to normal position at the next succeeding movement of said handle from normal position.

33. In a cash register and indicator, the combination of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, an independent handle or lever and means controlled by the same for preventing operation of the key-levers while said handle is in normal position, a money-drawer and a latch for holding it in closed position, and connections between said handle and drawer-latch, whereby operation of said handle serves both to permit depression of the key-levers and to release the money-drawer.

34. In a cash register and indicator, the combination of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, an independent handle or lever and means controlled by the same for preventing operation of the key-levers while said handle is in normal position, a money-drawer, and a latch for holding it in closed position, an alarm-gong and a striker therefor, and connections between the independent handle and the drawer-latch and gong-striker, whereby operation of said handle serves to permit depression of the key-levers and also to release the money-drawer and sound the gong.

35. In a cash register and indicator, the combination of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, indicators cooperating with said levers to indicate the values of the operated levers, means for temporarily holding the operated levers in depressed position, an independent handle or lever and means controlled by the same for releasing the operated levers when said handle is moved from normal position, and cancel cards or screens actuated by said handle for hiding or obstructing the view of the indicators when said handle is moved from normal position to release the previously-depressed key-levers.

36. In a cash register and indicator, the combination of a series of key-levers adapted to be operated by depressing their front ends, indicators cooperating with said levers to indicate their respective values, means for temporarily holding the operated key-levers in depressed position, a money-drawer and a latch for normally holding the same in closed position, cancel-cards adapted to alternately hide and expose the indicators, and an independent handle or lever and means cooperating therewith to release the operated key-levers, to move the cancel cards or screens into position to hide the indicators, and to release the money-drawer, upon operating said independent handle.

37. In a cash register and indicator, the combination of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, indicators cooperating with said levers to indicate their respective values, a handle or lever movable independently

of the key-levers and means controlled by the same for preventing operation of the key-levers while said handle is in normal position, and cancel cards or screws cooperating with said handle and moved by it into position to hide the indicators when said handle is moved from normal position to permit operation of the key-levers.

38. In a cash register and indicator, the combination of a series of key-levers adapted to be operated by depressing their front ends, indicators cooperating therewith to indicate their respective values, means for temporarily holding the operated key-levers in depressed position, an independent handle or lever and means controlled by the same for preventing operation of the key-levers while said handle is in normal position and operating when the handle is moved from normal position to not only permit operation of the key-levers but also release the key-levers depressed at the preceding operation of the machine, and cancel cards or screws for the indicators cooperating with said independent handle and moved by it into position to hide the indicators when said handle is moved to permit operation of the key-levers and release previously-operated key-levers.

39. In a cash register and indicator, the combination of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, an independent handle or lever and means controlled by the same for preventing operation of the key-levers while said handle is in normal position, a money-drawer and a latch for normally holding the same closed, indicators cooperating with the key-levers to indicate their respective values, cancel cards or screws cooperating with the indicators, and means intermediate said independent handle and the drawer-latch and cancel-cards for releasing the drawer and canceling the indication upon operating said handle.

40. In a cash register and indicator, the combination of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, indicators cooperating therewith to indicate their respective values, means for temporarily holding the operated key-levers in depressed position, an independent lever or handle and means controlled by the same for preventing operation of the key-levers while said handle is in normal position and operating when the handle is moved from normal position to not only permit operation of the key-levers but also to release the key-levers depressed at the preceding operation of the machine, a money-drawer and a latch for normally holding the same closed, cancel cards or screws cooperating with the indicators, and means intermediate said independent handle and the drawer-latch and cancel-cards for releasing the drawer and canceling the indication upon operating said handle.

41. In a cash register and indicator employing a forwardly and backwardly sliding money-drawer, and a latch for normally holding it closed and a spring for throwing it open, the combination, with said drawer and its latch or latch, of a series of key-levers representing different amounts and adapted to be operated by depressing their front ends, means for temporarily holding the operated key-levers in depressed position, an independent handle or lever, and means controlled by said handle for preventing movement of the key-levers from normal position and for releasing the money-drawer and the depressed key-levers upon operating such independent handle after the depression of any of the key-levers.

42. In a cash register and indicator employing a forwardly and backwardly sliding money-drawer, a latch for normally holding it closed and a spring for throwing it open, and an alarm-gong, the combination, with the money-drawer and its latch and with the alarm-gong and its stirrer, of a series of key-levers adapted to be operated by depressing their front ends, means for temporarily holding the operated key-levers in depressed position, an independent handle or lever, and means controlled by said handle for preventing movement of the key-levers from normal position and for releasing the operated key-levers, sounding the gong and releasing the money-drawer upon operating such handle or lever subsequent to depression of any of the key-levers.

43. In a cash-register the combination with a series of keys, of a lock for holding the keys in their depressed positions when operated, an independent handle and means connected to said handle for operating the key-locking means upon the initial movement of the handle to permit the keys to return to normal position and means for preventing operation of the keys until the handle is moved from its normal position.

44. In a cash-register the combination of a series of keys and locking means for retaining the same in their depressed positions, an operating-handle, a cash-drawer, a latch for the drawer, means connecting the handle for operating the key-locking means, means connecting the handle and drawer-latch and means actuated by the handle for preventing the operation of the keys until the handle has been moved from its normal position.

45. In a cash-register the combination of a series of keys as independent handle or lever, means controlled by the lever for preventing operation of the keys while said handle is in normal position, an alarm-gong and connections between the handle and gong, whereby the operation of said handle sounds the gong and permits the depression of the keys.

46. In a cash-register the combination of a series of keys as independent handle or lever, means controlled by the lever for preventing operation of the keys while said handle is in normal position, a series of indicators operated by the keys, a flash for said indicators operated by the handle; the construction being such that the operation of the handle will leave the keys free to be operated and will raise the flash.

47. In a cash-register the combination of a series of keys, a series of indicators controlled by the same means for locking the keys in their depressed positions so that an indicator corresponding to the depressed key will remain exposed as independent handle, a flash for the indicators controlled by the handle and means carried by the handle for releasing the keys that are in depressed position.

48. In a cash-register the combination with a series of keys, a series of pawls operated by said keys, a series of registering-wheels actuated by said pawls, a movable locking device for locking the pawls to the registering-wheels and a handle for operating said locking device.

49. In a cash-register the combination with a series of keys, of a series of registering-wheels, a series of pawls operated by the keys and engaging the registering-wheels, movable locking device for locking the pawls to the wheels, a cash-drawer and a handle arranged to control the movable locking device and to release the cash-drawer.

50. In a cash-register the combination with a series of keys of a pivoted frame arranged to cooperate with all of said keys, an operating-handle, means operated by said handle for preventing the operation of the locking-frame by the keys when the handle is in one position and permitting such operation when the handle is in a different position.

DESIGNS.

85,985. PICTURE-FRAME. MARTIN V. KARRACK, Toledo, Va., assignor of one-half to Charles G. Grimes, Portsmouth, Va. Filed Mar. 20, 1902. Serial No. 100,694. Term of patent 7 years.

Claim.—The design for a picture-frame, as herein shown and described.

85,986. BADGE. JEAN BAPTISTE HOLIE, Montreal, Canada. Filed Jan. 11, 1902. Serial No. 99,368. Term of patent 14 years.

Claim.—The design for a badge as herein shown and described.

85,987. CUT STONE. RICHARD C. H. SCHNEIDER, Orange, N. J. Filed Apr. 7, 1902. Serial No. 101,006. Term of patent 14 years.

Claim.—The design for a cut stone, substantially as shown and described.

85,988. CUT STONE. RICHARD C. H. SCHNEIDER, Orange, N. J. Filed May 8, 1902. Serial No. 104,600. Term of patent 14 years.

Claim.—The design for a cut stone, substantially as herein shown and described.

85,989. NAME-PLATE. WILLIAM D. HAMILTON, Allegheny, Pa. Filed Apr. 22, 1902. Serial No. 104,401. Term of patent 7 years.

Claim.—The design for a name-plate substantially as herein shown and described.

85,940. CLOCK-CASE. PAUL TETTERMAN, Chicago, Ill., assignor to the Angelus Prayer Clock Company, Chicago, Ill., a firm. Filed Mar. 18, 1902. Serial No. 99,942. Term of patent 7 years.

Claim.—The design for a clock-case, substantially as herein shown and described.

85,941. SCALE-BASE. ORANGE O. OHAR, Dayton, Ohio. Filed July 6, 1900. Serial No. 22,793. Term of patent 14 years.

Claim.—The design for a scale-base, substantially as shown and described.

85,942. CUP. GEORGE LANE, Dallas, Tex. Filed May 10, 1902.
Serial No. 100,542. Term of patent 7 years.

Claim.—The design for a cup, substantially as herein shown and described.

85,943. CALENDAR. HENRY BOTTE, New York, N.Y. Filed Apr. 1, 1902. Serial No. 100,563. Term of patent 24 years.

Claim.—The design for a calendar as herein shown and described.

85,944. PAPER BOX. ROBERT L. MYERS, Brooklyn, N.Y., assignor to J. and P. B. Myers, New York, N.Y., a firm. Filed May 5, 1902. Serial No. 100,106. Term of patent 24 years.

85,944.

Claim.—The design for a paper box, substantially as herein shown and described.

85,945. FONT OF PRINTING-TYPE. EDWARD EVERARD, Bristol, England. Filed May 2, 1902. Serial No. 100,100. Term of patent 14 years.

A B C D E F G H I J K L
M N O P Q R S T U V W
X Y Z a b c d e f g h i j
k l m n o p q r s t u v
x y z a b c d e f g h i j
1 2 3 4 5 6 7 8 9 0

Claim.—The design for a font of printing-type, substantially as shown and described.

85,946. SIDINGBOARD OR SIMILAR ARTICLE. MARTIN V. HAMMACK, Thibault, Va., assignor of one-half to Ophimus O. Grimes, Portsmouth, Va. Filed Mar. 1, 1902. Serial No. 99,360. Term of patent 7 years.

Claim.—The design for a sidingboard, or similar article, substantially as herein shown and described.

85,947. BUREAU OR SIMILAR ARTICLE OF FURNITURE. MARTIN V. HAMMACK, Thibault, Va., assignor of one-half to Ophimus O. Grimes, Portsmouth, Va. Filed Mar. 1, 1902. Serial No. 99,361. Term of patent 7 years.

Claim.—The design for a bureau or similar article of furniture, substantially as herein shown and described.

85,948. BUREAU OR SIMILAR ARTICLE. MARTIN V. HAMMACK, Thibault, Va., assignor of one-half to Ophimus O. Grimes, Portsmouth, Va. Filed Feb. 24, 1902. Serial No. 99,120. Term of patent 14 years.

Claim.—The design for a bureau or similar article substantially as herein shown and described.

85,949. Mosaic FLOOR-COVERING. EDWIN B. WHARTY, Chicago, Ill. Filed Apr. 20, 1902. Serial No. 100,517. Term of patent 24 years.

Claim.—The design for mosaic floor-covering herein shown and described.

85,950. MONUMENT. RAY E. WOLFF, Mansfield, Ohio. Filed Mar. 17, 1902. Serial No. 99,674. Term of patent 24 years.

Claim.—The design for a monument substantially as illustrated and described.

85,951. VEHICLE-BODY. WINFIELD S. ROSEN, Kama, N. H.
Filed Apr. 14, 1902. Serial No. 100,940. Term of patent 7 years.

Claim.—The design for a vehicle-body substantially as herein shown and described.

85,952. TRIMMING. GEORGE E. TAYLOR, New York, N. Y., assignor to the Kurewood Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Apr. 22, 1902. Serial No. 100,122. Term of patent 24 years.

Claim.—The design for a trimming substantially as shown and described.

TRADE-MARKS

REGISTERED JUNE 10, 1902.

88,417. EYE-GLASSES FOR EYEGLASSES AND SPECTACLES. BENNETT & CO., Chicago, Ill. Filed Apr. 22, 1902.

Two substantially horizontal upwardly-curved and shaded lines, between which are downwardly-depending lines forming a loop which connects the upwardly-curved lines. Used since March 4, 1902.

88,418. PRINTED COTTON DRESS GOODS. THE BOUTINIERE MFG. CO., Philadelphia, Pa. Filed Apr. 22, 1902.

A low-relief profile portrait of the late Queen Victoria and the words "VICTORIA DEI GRATIA." Used since 1890.

88,419. COTTON SHIRTING. ANDERSON COTTON MILLS, Anderson, S. C. Filed Oct. 10, 1901.

The representation of the picture known as "Pharaoh's Horse," consisting of three horses' heads inclosed within a circle, the two outer ones with outstretched necks and the center one having its neck arched. Used since October, 1890.

88,420. SHIRTING, SHIRTING, AND DRILLS. EDWARD L. CUTLER, New York, N. Y. Filed May 1, 1902.

The word "WANASSETT." Used since March 22, 1902.

88,421. Hosiery. PHILIP E. KIMMOT, Galveston, Tex. Filed May 4, 1902.

The words "BLACK CROW" associated with the representation of a crow perched upon a stocking. Used since March, 1899.

88,422. BOOTS AND SHOES. HANF PHOENIX & CO., INCORPORATED, Spencer and Boston, Mass. Filed May 7, 1902.

The word "INDUSTRY." Used since May 1, 1899.

88,423. CUSHION-GOODS. ADAM EMM. ST. JOSEPH, Mo. Filed Apr. 4, 1902.

The letters "E. Z." Used since February 15, 1902.

88,444. SEWING AND TYPE-WRITER MACHINES. **BONITA**.
HARDWARE & STAMP CO., San Francisco, Cal. Filed Mar. 12, 1902.

BONITA

The word "BONITA." Used since February 1, 1902.

88,445. WASHBOARD. **THE AMERICAN WASHBOARD CO.**, Cleveland, Ohio. Filed Apr. 25, 1902.

The representation of Uncle Sam, an eagle, and two aliens, Uncle Sam being seated in a chair, holding a washboard in his lap, explaining its characteristics to the aliens, and the eagle being perched upon the back of the chair. Used since January 1, 1902.

88,446. RIBS, STRAPTS, SPURS, AND BUCKLES. **NEXTOSTEEL**.
LINTON & CO., New York, N. Y. Filed May 2, 1902.

NEXTOSTEEL

The word "NEXTOSTEEL." Used since January 7, 1902.

88,447. SOFT-COAL FUEL-BURNER. **SOLID COMFORT**. **FRANK FENNELL**, Akron, Ohio. Filed Oct. 24, 1901.

SOLID COMFORT

The words "SOLID COMFORT." Used since September 15, 1901.

LABELS

REGISTERED JUNE 10, 1902.

DECISIONS

OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

CORY AND BARKER v. TROUT.

Decided May 8, 1908.

INTERFERENCE—ADDITION OF NEW PARTY—DECISION RENDERED
ON PRIORITY.

After a decision by the Examiners-in-Chief and the Commissioner upon the question of priority of invention it is too late to add a new party to the interference.

ON MOTION.

SET-WORKS FOR SAW-MILL CARRIAGES.

Application of Michael Cory and Ruben F. Barker filed December 14, 1899, No. 740,620. Application of William H. Trout filed August 18, 1897, No. 648,691.

Mr. L. K. Gillson and Mr. H. H. Bliss for Cory and Barker.

Messrs. Dodge & Sons for Trout.

ALLEN, Commissioner:

This case comes up on a motion by Trout that the decision of the Commissioner of Patents (73 MS. Dec., 374) awarding priority of invention to Cory and Barker be withheld, that proceedings be suspended, and that the issue be suggested to one McDermott with a view to a redeclaration of the interference including McDermott as one of the parties.

Cory and Barker have made a motion to dismiss Trout's motion on the ground that it is not warranted by the rules.

This interference having proceeded so far that a decision on priority has been rendered by the Examiner of Interferences, the Examiners-in-Chief, and the Commissioner, it is too late, under the well-settled practice of the Office, to dissolve it merely for the purpose of adding a new party. If there is another applicant before this Office claiming or entitled to claim the invention here in controversy, he may, after the decision in this case has become final, be placed in interference with the successful party.

The motion by Trout being without merit should be denied rather than dismissed because of irregularity. Both motions are therefore denied.

EX PARTE SMITH.

Decided May 8, 1908.

DIVISION—SHOE-SEWING MACHINE.

Where the stitch-forming mechanism and the combined awl and feeding mechanism of a shoe-sewing machine have not acquired a distinct status in art and manufacture and are not separately classified in this Office, *Held* that division should not be required notwithstanding the fact that the mechanisms are capable of separate use.

99 O G—11—11

ON petition.

SHOE-SEWING MACHINE.

Application of Eugene Smith filed August 8, 1901, No. 71,825.

Mr. Walter F. Rogers for the applicant.

ALLEN, Commissioner:

This is a petition from that part of the Examiner's action requiring division between claims 1, 2, and 3, which cover a stitch-forming mechanism, and claims 4, 5, and 6, which cover a combined awl and feeding mechanism.

The invention relates to improvements in a shoe-sewing machine for sewing welts to the uppers and insoles of shoes.

The stitch-forming mechanism and the combined awl and feeding mechanism, though independently operated by a common cam, are so related to each other that they cooperate to produce a unitary result. While it may be true, as the Examiner contends, that any other awl and feeding mechanism might be substituted for the one invented by the petitioner and that any other known or unknown stitch-forming mechanism might be substituted for the one here disclosed and claimed, it does not appear that a stitch-forming mechanism and an awl and feeding mechanism have acquired a distinct and independent place in the arts and manufactures and are independently manufactured and sold.

They are not separately classified by the Office. It is true that each of these mechanisms is separately constructed and either one of them can be removed from the machine without disturbing the other; nevertheless each one so coacts with the other as to mutually contribute to produce a unitary result, and in view of the further fact that they are not recognized by the inventors and manufacturers as having a distinct place in the arts and manufactures, in that they are not separately manufactured and sold, the requirement of division should not be insisted upon.

The petition is granted.

PATTEN v. WIESENFELD.

Decided May 10, 1908.

1. INTERFERENCE—RECORD DATE—TWO APPLICATIONS DISCLOSED INVENTION.

Where W. had two applications pending in either of which the claims in controversy could be made and he elects to make them in the later case, *Held* that he is entitled to the date of his earlier case as his record date upon the question of priority.

2547

2. SAME—IRREGULARITY—MERELY TECHNICAL OBJECTIONS.

Where priority was awarded to W. by reason of a prior application not directly included in the interference and P. moves to dissolve on the ground of irregularity, alleging that the earlier case should have been positively included in the interference, *Held* that the motion relates to a technicality rather than to the merits and was properly denied.

APPEAL ON MOTION.

DOCKING TOL.

Application of James S. Patten filed February 5, 1901, No. 46,112. Application of Robert S. Wiesenfeld filed March 6, 1901, No. 50,024.

Messrs. Munn & Co. for Patten.

Messrs. Watson & Watson for Wiesenfeld.

ALLEN, Commissioner:

This is an appeal by Patten from the decision of the Primary Examiner denying a motion to dissolve the above-entitled interference on the ground that there has been such irregularity in declaring the same as will preclude a proper determination of the question of priority.

The records show that Wiesenfeld has two applications which disclose this invention, which were filed, respectively, on December 8, 1900, and March 6, 1901. Patten filed his application on February 5, 1901. The interference was declared between Patten's application and the later of the two applications filed by Wiesenfeld.

Before declaring the interference it was found that Patten was entitled to some of the claims of the Wiesenfeld application and that Wiesenfeld was entitled to some of the claims of the Patten application. These claims were duly suggested to each party under the provisions of Rule 93. Before the interference was declared the earlier of the two Wiesenfeld applications was withdrawn from issue and Wiesenfeld was notified that he should elect which one of the two applications filed by him he wished to prosecute and abandon the other.

Wiesenfeld elected to prosecute the later application, but did not formally abandon the earlier application. When the application filed by Patten and the later application filed by Wiesenfeld were in proper condition, the Examiner declared the interference between them, making Patten and Wiesenfeld, respectively, the senior and junior parties thereto, and omitted to refer in any way to the earlier application filed by Wiesenfeld.

After the preliminary statements had been received and approved and times had been set for taking testimony the Examiner informed the Examiner of Interferences that—

in arranging the parties as required by Rule 97, Wiesenfeld should have been made the senior party, since he has an earlier application, No. 39,181, filed December 8, 1900, for precisely the same invention, action upon which has been suspended at his request, until the termination of this interference.

The Examiner of Interferences thereupon made Wiesenfeld the senior party and Patten the junior party and duly informed them of this action.

On the same date judgment of priority on the record was awarded to Wiesenfeld in accordance with the provisions of Rule 114.

The Examiner stated in his decision that—when the interference was declared, the circumstances were such that the earlier application was ignored or forgotten.

[Vol. 99. No. 11.]

It is contended by Patten on this appeal that the irregularity consists in the fact that the Primary Examiner erred in not including the earlier application in the interference. It is insisted that if the earlier application is to be considered at all in this interference it should be directly included therein and not referred to, as is now the case.

The points argued raise the question of form and do not go to the merits of the case. The contention is that the interference was irregularly declared, in that the practice followed by the Examiner was not strictly regular, not that the irregularity consists in such vital defects as to preclude the proper determination of the question of priority. It is nowhere contended that the earlier application of Wiesenfeld does not disclose the same invention as that disclosed by the later application. It is not contended that had the interference included the earlier application of Wiesenfeld instead of the later one the award of priority would have been different from that rendered.

In *Bundy v. Rumbarger* (93 O. G., 2002) it was said:

As stated by the court in *Cain v. Park*, the Office is justified in taking notice of facts shown by its records in order that justice may be done. (See also *Hunter v. Wightman*, C. D., 1907, 178; 81 O. G., 1783.)

The invention in issue being disclosed in the prior application and the second application being filed while the first was pending, the second is a continuation of the first for the purpose of giving . . . the benefit of its date for a constructive reduction to practice.

In the case of *Silverman v. Hendrickson* (90 O. G., 1171) the Court of Appeals of the District of Columbia said:

The appellee Hendrickson on June 9, 1897, filed his original application in the case, for which the application now in interference (filed August 20, 1897) is only a substitute. This original application disclosed the invention in controversy and must be regarded, according to the usual rule, as a constructive reduction to practice . . . as of the date of June 9, 1897.

It is clear from the records of this interference that there has been no such irregularity in the declaration of the same as to preclude the proper determination of the question of priority of invention.

The decision of the Primary Examiner refusing to dissolve this interference is affirmed.

EX PARTE HOLLAND.

Decided May 13, 1902.

INTERFERENCE—REJECTED CLAIMS—COUNTERCLAIMS.

Where the claims of an application are rejected upon references and without overcoming the rejection the applicant petitions to have an interference declared with a patent to another party granted while his application was pending, *Held* that his remedy is by an appeal from the rejection when it shall have been repeated.

ON petition.

PLAYING-CARDS.

Application of Thomas Osborne Holland filed October 6, 1897, No. 654,143.

Mr. R. G. Dyrenforth for the applicant.

ALLEN, Commissioner:

This is a petition that the Examiner be directed to reconsider his action rejecting the claims of the above-entitled application on the ground of lack of invention and to declare an interference between said application and a certain patent to Holman.

It appears that the Examiner has rejected all of the claims in this application for lack of invention in view of certain references and for reasons which are of record. Included in these claims are four claims which were copied from the patent to Holman referred to above. The application on which this patent was granted was pending contemporaneously with the present application. For this reason it is urged by petitioner that the claims of this application should be allowed and placed in interference with those of the patent. There has been but one rejection of the claims as amended.

It is clear from this statement of the case that the present petition has no standing. The Examiner has not acted twice upon the question presented by it. For this reason alone it should be dismissed. (*Ex parte Shone*, 90 O. G., 863.) Moreover, the question presented is one relating to the merits of the case. Lack of invention is one of the grounds for rejection specified in Rule 133. From a second rejection of the claims on this ground appeal lies under this rule to the Examiners-in-Chief.

The petition is dismissed.

EX PARTE POWRIE.

Decided May 15, 1902.

1. INTERFERENCE—RULE 105—CONCEALING PART OF INVENTION FROM OPPONENT—PROCESS AND PRODUCT.

Where an interference is declared as to a process and one of the parties has claims to the product which is the necessary result of the process, *Held* that he will not be permitted to conceal his product claims from his opponent by filing certified copies of the parts of his application relating to the process under Rule 105.

2. SAME—SAME—ADDITIONAL STEP TO PROCESS—INDEPENDENT INVENTION.

Where an interference is declared as to a process and one of the parties has claims to an additional step performed after the process as set forth in the issue is completed and the opposing party does not disclose that step, *Held* that the additional step may be concealed from the other party to the interference under Rule 105.

ON petition.

PHOTOGRAPHS IN COLORS AND METHOD OF PRODUCING SAME.

Application of John H. Powrie filed October 25, 1901, No. 79,967.

Mr. L. K. Gillson for the applicant.

ALLEN, Commissioner:

This is a petition from an action of the Examiner holding that the above-entitled application is not properly divisible and refusing to permit the use of certified copies of a part of the application to be used in an interference in which it is involved.

The claims of this case which are included in the interference cover a process. The application contains other claims covering a product resulting from this process and also one claim which covers the process more specifically than those which are in the interference. An inspection of this claim (claim 7) shows that it includes a step in the process which is not included in the other process claims. By reason of this step the process covered by claim 7 is a different process from that covered by the other claims and would be patentable thereover if

[Vol. 99. No. 11.]

included in a separate application. Moreover, it is not essential to a complete understanding of the process covered by the remaining claims that the additional step included in claim 7 should be disclosed. Claim 7, therefore, is for an invention distinct from the other process claims and one which is not a part of the invention included in the issue of the interference. It may therefore, together with parts of the specification relating thereto, be withheld from inspection by the other party to the interference, as provided by Rule 105.

Claims 1 to 4 cover the product resulting from the process set forth in the other claims. This product is the necessary result of the process, though it might, perhaps, be made in other ways. A disclosure of the process, therefore, is necessarily such a disclosure of the product as to form a basis for claims for the product, and a party disclosing and claiming the process would be entitled to claim the product either in the same application or in a separate application—that is, the inventions are not absolutely independent and a party claiming both should not be allowed to conceal one of them from a party claiming the other. (*Ex parte Walrath*, 87 O. G., 1397; *Zwietusch v. Wittemann*, 75 O. G., 183.)

Claims 1 to 4 should be left open to inspection to the other party to the interference.

To the extent above indicated the petition is granted.

EX PARTE MORIARTY.

Decided May 17, 1902.

DIVISION—COMBINATION CLAIM AND CLAIM TO A SPECIFIC ELEMENT.

Held that division was properly required between a combination including a buoy as one of the elements and a claim to a specific form of buoy where that buoy is capable of use in other relations.

ON petition.

MEANS FOR LOCATING SUNKEN ARTICLES.

Application of Thomas J. Moriarty filed November 8, 1901, No. 81,546.

Messrs. Edgar Tate & Co. and Mr. Wm. N. Cromwell for the applicant.

ALLEN, Commissioner:

This is a petition from the action of the Examiner requiring division in the above-entitled application.

The records show that the Examiner originally divided the claims into three groups and held that two of the groups covered two distinct species of the same generic invention and that the third group covered a separate and independent invention from that covered in the first two groups of claims.

The Examiner has withdrawn his requirement of division on the ground that two separate forms of the same generic invention are specifically claimed, but insists on his requirement of division between the third group and the remaining claims in the case.

The third group comprises claims 17, 18, 19, 20, and 21.

The claims, except those numbered 17, 18, 19, 20, and 21, cover combinations more or less specifically stated between a vessel, a floating device or buoy attached to the same, and a connecting means between the two. The object of the float or buoy is to indicate the position of the vessel when sunk, the connecting mechanism being so constructed that the float will be released from the vessel and rise to the surface of the water when the vessel sinks, thereby indicating the position of the sunken vessel.

Claims 17, 18, 19, 20, and 21 cover a specific form of buoy. A buoy alone is a distinct subject-matter of invention from a combination of elements which includes a buoy as one of said elements. The buoy which is included as an element in the combination claimed is not limited to any particular construction. The specific buoy defined in claims 17, 18, 19, 20, and 21 is useful in other relations and for other purposes than as an element in the combination claimed. Each of these inventions is capable of separate and independent use. They should not, therefore, be presented in the same application.

The petition is denied.

DICKINSON v. THIBODEAU v. HILDRETH.

Decided May 17, 1902.

INTERFERENCE—MOTION TO DISSOLVE—AFFIDAVITS AS TO OPERATIVENESS.

Where on a motion to dissolve the question as to the operativeness of one of the inventions is raised, *Held* that affidavits supporting or traversing the allegation may be received and considered.

ON motion.

CANDY-PULLING MACHINE.

Application of Herbert M. Dickinson filed November 5, 1901, No. 81,377. Application of Charles Thibodeau filed November 26, 1900, No. 37,734. Application of Herbert L. Hildreth filed September 21, 1900, No. 30,703.

Mr. Edward Taggart and Mr. James L. Norris for Dickinson.

Messrs. Wright, Brown & Quimby for Thibodeau.

Mr. Alex. P. Browne and Messrs. Watson & Watson for Hildreth.

ALLEN, Commissioner.

This is a motion by Thibodeau that certain affidavits filed by Hildreth and Dickinson in connection with a motion to dissolve the above-entitled interference be removed from the files and such disposition thereof made as the Commissioner may determine.

It appears that a motion to dissolve the interference has been transmitted to the Primary Examiner for his determination and is now pending before him. This motion was brought by Hildreth and is based on the ground, among others, that the Dickinson machine is inoperative and is for this reason not patentable. In connection with this motion Hildreth and Dickinson have filed affidavits by various persons supporting or traversing

[Vol. 99. No. 11.]

the proposition that the Dickinson machine is inoperative.

In the *ex parte* prosecution of an application affidavits supporting or traversing a rejection on the ground that a device is inoperative may be received under the provisions of Rule 76, and there appears to be no good reason why such affidavits should not be received when the question of operativeness is raised in *inter partes* proceedings. This question is of course to be determined from the record; but there is no reason why arguments relating thereto should not be considered. The fact that such arguments are presented under oath in the form of affidavits does not render them irrelevant.

The moving party has based his motion on the decision in the case of *McKensie v. Gillespie v. Ellis v. McElroy v. Ocumpaugh v. Norton*, (93 O. G., 2103). In this case, however, affidavits were presented tending to show that the invention was unpatentable because of more than two years prior public use. That such a question will not ordinarily be considered during interference proceedings is well established; nor can such a bar be established by *ex parte* affidavits. As was said, therefore, in this case—

upon motion to dissolve an interference on the ground that the issue is not patentable affidavits which under the law cannot be considered in determining the patentability of the issue should not, when their true nature is perceived, remain in the files.

In the present case the affidavits are presented in connection with a question to which under the law they are relevant. They should therefore remain in record and have such consideration as they are entitled to receive.

The motion is denied.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

ROE v. HANSON.

Decided April 1, 1902.

1. INTERFERENCE—PRIORITY.

Where Roe conceived the invention in November, 1898, made a machine embodying it in August, 1899, and operated it at that time in such manner as to show its practicability, and in March, 1900, first used it in a mill and made the first commercial test of it, *Held* that he is entitled to the decision on priority as against Hanson, who conceived in April, 1899, and reduced to practice in July, 1899.

2. SAME—REDUCTION TO PRACTICE—COMMERCIAL USE UNNECESSARY.

Where Roe in August, 1899, completed the shifting device for the saws of a gang-edger and embodied it in a full-sized machine adapted for practical use and then tested it, but did not place it in a sawmill and test it commercially until March, 1900, *Held* a reduction of the invention to practice in August, 1899.

3. SAME—PRIORITY—DILIGENCE.

Where Roe conceived the invention in November, 1898, completed drawings in April, 1899, and then commenced work on a machine which was completed in August, 1899, and it appears that he was a very busy man and devoted all of the time that he could spare to work upon this invention, *Held* that he was not lacking in diligence.

4. SAME—SAME—DELAY IN COMMERCIAL USE.

Where Roe completed his machine in August, 1899, and wished to place it in the sawmill which he was then building for his company, but was not permitted to do so, and where he placed it in the next mill built in March, 1900, *Held* that there was no unreasonable delay by him in making commercial use of his invention.

Messrs. Wilkinson & Fisher for the appellant.

Messrs. Dodge & Sons for the appellee.

MORRIS, J.:

This is an appeal from the Commissioner of Patents in an interference case, wherein the subject-matter of controversy is the question of priority of invention of an improvement in machines for sawing timber, which is described in four issues formulated in the Patent Office, as follows:

1. In a gang-edger, the combination of a saw-arbor, a series of saws mounted thereon, a series of slides of like form and dimensions having their outer ends at an angle to the body of the slide, and connections between said slides and the saws.
2. In a gang-edger, the combination of a saw-arbor, a series of saws mounted thereon, a series of slides of like form and dimensions having their outer ends at an angle to the body of the slide, an arm connected to each of said slides, a guide for said slides and arms, and connections between said slides and the saws.
3. In a gang-edger, the combination of a saw-arbor, a series of saws mounted thereon, guides or ways adjacent to said arbor, a series of slides of like form and dimensions, mounted on said ways, said slides having a straight body portion with their outer ends bent at an angle thereto; an arm extending from each of the slides at an angle to the straight portion and in a direction opposite to that of the bent portion of the slides; a guide for said slides and arms, and connections between said slides and the saws.
4. In a gang-edger, the combination of a saw-arbor, a series of saws mounted thereon, guides or ways, a series of slides of like form mounted thereon, said slides having their outer ends bent at an angle substantially as described, arms extending from the under face of the slides to one of the guides, means for holding the slides in their adjusted position, and connections between said slides and the saws.

A gang-edger is a gang or combination of circular saws for splitting and edging boards; or, as it is defined in the *Century Dictionary*, it is—

a machine having from three to six circular saws on a common mandrel, capable of being so adjusted as to split wide planks into boards or scantlings of the width required.

It is a machine well known and widely used in the lumber regions of the Western States of our Union. In the issues above recited, which are taken from the claims of the application of the appellant Roe, a complete gang-edger is described; but the subject-matter of the controversy between the parties, and the subject of invention here, is greatly more limited. It is merely the shifting device for adjusting the circular saws into their desired positions. This adjustment is effected by the use of hand-levers.

The appellant Alphens E. Roe, who is the junior applicant, alleges in his preliminary statement that he conceived the invention, first made drawings of it, and disclosed it to others, on or about November 1, 1898; that on or about May, 1899, he showed and explained these drawings to his opponent, the appellee Dempsey B. Hanson; that he first embodied his invention in a full-sized machine which was completed and operated before August 1, 1899, and which was at that time examined by Hanson; that, on March 19, 1900, this machine was successfully operated and used in the city of New Whatcom, in the State of Washington, where the appellant resided; that he has since continued to use the same; and that he has also manufactured another machine for use in the sawmills of the company by which he was employed, the Bellingham Bay Im-

[Vol. 99. No. 11.]

provement Company. He filed his application for a patent on January 2, 1900.

The appellee Dempsey B. Hanson in his preliminary statement alleges that he conceived the invention on or about March 25, 1899; that he communicated it to others about April 1, 1899; that he made drawings or sketches of it about April 15, 1899, or rather that he caused such drawings or sketches to be made by a draftsman for him; that the invention was commenced to be embodied in full-sized operative form about May 1, 1899, and completed in the early part of July, 1899; and that other machines have since that time been in public use.

Hanson's application for patent was filed in the Patent Office on September 6, 1899, and Letters Patent were issued to him on January 9, 1900, seven days after the filing of Roe's application, and probably in ignorance of the filing of that application. At all events, although a patentee, he cannot, as against Roe, be entitled to any special advantage from his patent. He is, however, the senior applicant; and, as such, he is entitled to have the burden of proof placed upon his opponent Roe. This was the relative position in which they were placed by the Patent Office.

Upon the testimony and the record made for themselves by the parties, the Examiner of Interferences and the Board of Examiners-in-Chief held that the appellant Roe was entitled to judgment of priority of invention. But upon appeal to the Commissioner of Patents, the Assistant Commissioner, who sat in his place, reversed the decision of the Board, and awarded judgment of priority of invention to the appellee Hanson. By all three of the tribunals of the Office it was held that Roe was the first to conceive the invention, but second to Hanson in his reduction to practice. The decision, therefore, turned upon the question of the due diligence of Roe; and in this regard the Examiner of Interferences and the Board of Examiners held in his favor, and the Assistant Commissioner against him.

From the decision of the Assistant Commissioner the applicant Roe has appealed to this court.

That the appellant Roe was the first to conceive the invention in controversy may be assumed as the result of the testimony in the case. It is so held by all the tribunals of the Patent Office, and is not very seriously controverted on behalf of the appellee Hanson. We deem it unnecessary, therefore, to examine the testimony so far as it relates to this point. The conception and disclosure are shown to have occurred in November, 1898.

The appellee Hanson's conception and disclosure are not claimed to have occurred until about April 1, 1899, five months after the disclosure of the invention by Roe. Undoubtedly, therefore, in the matter of conception of the invention he was anticipated by the latter. The difficulty in the case is as to the question of reduction to practice, and as to the diligence of Roe, if it should appear that Hanson was the first to reduce to practice. If there were no actual reduction to practice by either party

before September 6, 1899, the date of the filing of Hanson's application, the latter would be entitled to priority of first constructive reduction to practice. But there is proof tending to show actual reduction to practice by both parties before that date.

Both parties were evidently working at the invention during the same period of time, the spring and summer of 1899. Hanson was undoubtedly the more diligent about this time; although there may have been a special motive for his activity, if the attempt on the part of Roe to show that Hanson derived the idea from disclosure to him by Roe about May 1, 1898, be regarded as successfully shown by the testimony. On this point, however, it is unnecessary to express an opinion.

It seems that about the end of April, 1899, Hanson communicated his idea to the Vulcan Iron Works, a company which constructed machines of this general character, and that drawings were made for him by a draftsman in the employment of the company. Thereupon during the months of May, June, and July, a machine embodying the invention was built by that company at its factory, in the city of Seattle, in the State of Washington, which was sold on July 14, 1899, to the Rock Creek Lumber Company, and thereafter used by this latter company. Hanson at this time had no specially engrossing occupation; while Roe, who was a mechanical engineer in the service of a company known as the Bellingham Bay Improvement Company, with its headquarters at New Whatcom, in the same State, was an extremely busy man, and could only give his attention to the invention at odd moments when his time was not demanded by the service of his company. After his conception and disclosure of the invention in November of 1898, it is shown that he worked diligently enough in the preparation of drawings, which he finished in April or May of 1899; and thereupon that he commenced forthwith the construction of a machine embodying the invention, which was finished in August of 1899. He was occupied at the time in the restoration of a mill for his company which had been destroyed in June of the previous year. He first constructed a small mill, and thereafter a larger one. The gang-edger, which he had procured to be finished in August he was desirous to place in the first or smaller of the two mills, which was finished soon afterward; but

[Vol. 99.

the officers of the company preferred to have their old gang-edger repaired and used in this mill. The gang-edger with the appellant's shifting device was placed in the larger mill subsequently completed and was first operated in that mill in March of 1900. This was the first commercial test of it; but it had already been operated in such manner as to show its practicability, and it was and remained in condition adapted for practical operation.

Under these circumstances we cannot hold that there was any want of diligence on the part of the appellant. His device was complete and embodied in a full-sized machine adapted for practical application in August of 1899. For the failure to test it by putting it forth with into practical commercial use, there is sufficient reason shown. It was tested in fact at the time and shown to be operative; and when it was finally put to the test of actual commercial use, it was shown that there was nothing wanting to its practicability. We think that in this regard this case falls within the principle of the case of *Mason v. Hepburn* (18 D. C. App., 86; 84 O. G., 147) and *Lindemeyer v. Hoffman*, (18 D. C. App. 1.)

The Examiner of Interferences and the Board of Examiners-in-Chief are not clear that the construction of Roe's machine in August of 1899, without actual test of it by commercial use, was reduction to practice; and the Commissioner in great measure basing his opinion upon the theory that Roe's reduction to practice was not earlier than the filing of his application on January 2, 1900, holds that there was too great delay and want of due diligence on his part. We are of opinion that the construction of his machine in August of 1899 was actual reduction to practice by him, that the delay in using that machine commercially and thereby testing it by actual use was not unreasonable under the circumstances, and that there was no want of due diligence on his part between his conception and disclosure in November of 1898 and his actual reduction of the invention to practice in August of 1899. And being of this opinion we must hold, in opposition to the decision of the Assistant Commissioner, that judgment of priority of invention should be awarded to the appellant Alpheus E. Roe.

The clerk of this court will certify this opinion and the proceedings in this court in the premises to the Commissioner of Patents according to law.

Classification Bulletin.

CLASSIFICATION BULLETIN No. 6, containing the revision made during the months of March and April, 1902, is now out. Price, ten cents.

Communications to the Patent Office.

RULE 2. A separate letter should in every case be written in relation to each distinct subject of inquiry or application. Assignments for record, final fees, and orders for copies or abstracts must be sent to the Office in separate letters.

Amendment to English Patent Law.

CHAPTER 12.

An Act to amend the Law with reference to International Arrangements for Patents, 17th August 1901.

Be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:

1.—(1) In the first proviso to subsection one of section one hundred and three of the Patents, Designs, and Trade Marks Act, 1888 (which section relates to the time for making applications for protection under international arrangements), the words "twelve months" shall be substituted for the words "seven months."

(2) An application under that section shall be accompanied by a complete specification, which, if it be not accepted within the period of twelve months, shall, with the drawings (if any), be open to public inspection at the expiration of that period.

2.—(1) This Act may be cited as the Patents Act, 1901, and may be cited and shall be construed as one with the Patents, Designs, and Trade Marks Acts, 1888 to 1891.

(2) This Act shall come into operation on the first day of January one thousand nine hundred and two.

Design Patents.

AN ACT to amend section forty-nine hundred and twenty-nine of the Revised Statutes, relating to design patents.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section forty-nine hundred and twenty-nine of the Revised Statutes be, and the same is hereby, amended so as to read as follows:

"Sec. 4929. Any person who has invented any new, original, and ornamental design for an article of manufacture, not known or used by others in this country before his invention thereof, and not patented or described in any printed publication in this or any foreign country before his invention thereof, or more than two years prior to his application, and not in public use or on sale in this country for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fees required by law and other due proceedings had, the same as in cases of inventions or discoveries covered by section forty-eight hundred and eighty-six, obtain a patent therefor."

Approved May 9, 1902.

Hearings.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 16, 1902.

Notice is hereby given that there will be no cases placed upon the docket to be heard by either the Commissioner or the Assistant Commissioner during the months of July and August, 1902.

F. I. ALLEN,
Commissioner.

PATENTS

GRANTED JUNE 17, 1902.

702,889. DRAWER-SUPPORT. FRANK O. ARDENSON, Jamestown, N. Y. Filed July 5, 1901. Serial No. 67,097. (No model.)

Claim.—1. A drawer-support having its upper edge formed as a guide for the upper edge of the drawer end, the rear end of said support attached and the front end supported and left free for lateral adaptation to the drawer end, a suitable case or frame for mounting said support, substantially as shown.

2. A drawer-support having its upper and under edges formed as a guide for the upper and under edges of drawer end, the rear end of said support attached and the front end supported and left free for lateral adaptation to the drawer end, a suitable case or frame for mounting said support, substantially as shown.

3. Drawer-supports consisting of a single strip for each drawer end, said strip grooved on its upper edge and having its rear end attached and the front end supported and free for lateral adaptation to the drawer end, a suitable case or frame for mounting said support, substantially as shown.

4. Drawer-supports consisting of a single strip for each drawer end, said strip grooved on its upper and under edges to receive the top and bottom of drawer end and having its rear end attached and the front end supported and free for lateral adaptation to the drawer end, a suitable case or frame for mounting said support, substantially as shown.

5. A drawer-support consisting of a grooved strip a suitable case or frame for mounting said support, the rear end of said strip attached to the frame and the front end supported and free to move sideways for lateral adaptation to the drawer end, said front end extended out as a drawer-stop, substantially as shown and described.

6. In drawers, commodes and like pieces of furniture, the frame having the front cross-piece, grooved on its inner side, a single strip for a drawer-end support attached to said frame at the rear end, said strip grooved on its upper side and having a tongue to fit said groove in said front cross-piece, the front end of said strip left free for lateral adaptation to the drawer end, said front end extended out as a drawer-stop, substantially as shown and for the purpose specified.

702,890. MEAN FOR UNITING FABRICS. BATTERMAN ARNOLD, Verona, N. J., assignor to Anna M. Arnold, Verona, N. J. Filed Mar. 17, 1902. Serial No. 700,657. (No model.)

Claim.—1. The combination with abutting folded edges of fabric or similar materials, of uniting-stitches passing through the fabric obliquely to the plane of the fabric, substantially as described.

2. The combination with abutting folded edges of fabric or similar materials, of uniting-stitches passing through the folded portions and body of the fabric obliquely to the plane of the fabric, substantially as described.

3. The combination with abutting folded edges of fabric or similar materials, of overseam-stitches securing the edges together and consisting of covering-stitches binding down the folded portions of the edges and uniting-stitches passing through the folded portions and body of the fabric obliquely to the plane of the fabric, substantially as described.

and uniting-stitches passing through the fabric obliquely to the plane of the fabric, substantially as described.

4. The combination with abutting folded edges of fabric, or similar materials, of overseam-stitches securing the edges together and consisting of covering-stitches binding down the folded portions of the edges and uniting-stitches passing through the folded portions and body of the fabric obliquely to the plane of the fabric, substantially as described.

5. The combination with abutting edges of fabric or similar materials folded over on the back of the fabric, of uniting-stitches passing through the fabric obliquely to the plane of the fabric and lying substantially within the face of the fabric, substantially as described.

6. The combination with abutting edges of fabric or similar materials folded over on the back of the fabric, of uniting-stitches passing through the folded portions and body of the fabric obliquely to the plane of the fabric and lying substantially within the face of the fabric, substantially as described.

7. The combination with abutting folded edges of fabric or similar materials, of overseam-stitches securing the edges together and consisting of covering-stitches binding down the folded portions of the edges and uniting-stitches passing through the fabric obliquely to the plane of the fabric and lying substantially within the face of the fabric, substantially as described.

8. The combination with abutting folded edges of fabric or similar materials, of overseam-stitches securing the edges together and consisting of covering-stitches binding down the folded portions of the edges and uniting-stitches passing through the folded portions and body of the fabric obliquely to the plane of the fabric and lying substantially within the face of the fabric, substantially as described.

9. The combination with abutting folded edges of fabric or similar materials, of overseam-stitches securing the edges together and consisting of covering-stitches and uniting-stitches of equal length with the covering-stitches on the back of the fabric and binding down the folded edges and the uniting-stitches oblique to the plane of the fabric and lying substantially within the face of the fabric, substantially as described.

10. The combination with abutting folded edges of one-edge knit fabric, of overseam-stitches securing the folded edges together and consisting of covering-stitches binding down the folded portions of the edges and uniting-stitches passing through the knit fabric obliquely to the plane of the fabric, substantially as described.

11. The combination with abutting folded edges of one-edge knit fabric, of overseam-stitches securing the folded edges together and consisting of covering-stitches binding down the folded portions of the edges and uniting-stitches passing through the folded portions and body of the fabric obliquely to the plane of the fabric and lying substantially within the face of the fabric, substantially as described.

702,891. DIE FOR CUTTING MOSAIC BLOCKS. WILLIAM A. ARNOLD, Paterson, N. J. Filed Apr. 30, 1901. Serial No. 52,122. (No model.)

Claim.—1. A female die for cutting mosaics, having an inner cutting edge in combination with exterior cutting edges or ridges, points and valleys, for the purpose of crushing and carrying away the covered and waste portions from the outer edges of the mosaic pieces as and for the purpose set forth and described.

W. O. G.—153

2. The combination between a punch having a cutting edge *l* and a cutting edge *m*; and a female die having an ordinary cutting inner edge in connection with auxiliary triangular-shaped exterior cutting edges and rows of points *n* and for the purpose set forth and described.

3. In a female die for cutting means having an ordinary cutting inner edge in combination with an auxiliary triangular-shaped exterior cutting edge and rows of perforating-points forming the same shaped piece as the required piece, as set forth and described.

4. The combination in an ordinary female die having an ordinary cutting edge, and an auxiliary exterior triangular-shaped cutting edge and in connection with additional rows of perforating pyramidal points, parallel to the first-mentioned cutting edge, and covering or cutting lines, *n* *a*, *n* *a*, and for the purpose set forth and described.

5. The combination between a punch having cutting edge *l* and cutting edge *m*, and a female die, the cutting edges of the triangles, the perforating-points *n*, the covering-lines *n* *a*, covering-line *h*, and valleys *h'* for carrying away the broken portions as and for the purpose set forth and described in the annexed drawings and specification.

702,892. CIRCUIT AND CUT-OUT FOR ELECTRIC-ARC LAMPS.
MILWAUKEE E. BAKER, Newark, N. J., assignor to Manhattan General Construction Company, a Corporation of New York. Filed June 10, 1901. Serial No. 63,398. (No model.)

Claim.—1. In an arc-lamp, a shunt-magnet having a high-resistance winding and a low-resistance winding, means for cutting out the high-resistance winding and starting the lamp through the low-resistance winding, and means for restoring the high-resistance winding and cutting out the low-resistance winding when the lamp begins to operate.

2. In an electric-arc lamp, an initial circuit of low resistance for starting the lamp, inductive restraining means applied to the said circuit for preventing the premature starting of the lamp, and means for cutting out the restraining means and permitting the low-resistance circuit to operate without hindrance.

3. In an electric-arc lamp, means for preventing excessive tension in the lamp-circuit at the starting of the lamp, such means consisting of a low-resistance starting-circuit, inductive restraining means applied thereto, means for automatically cutting out the restraining means, and devices for cutting out the starting-circuit when the lamp begins to operate.

4. In an electric-arc lamp, a divided initial circuit one part of which is of low resistance and the other part of which constitutes an inductive restraint upon the low-resistance circuit, and automatic means for cutting out the restraining means and permitting the low-resistance part of the circuit to operate without hindrance.

5. In an electric-arc lamp, a high-resistance initial circuit and a low-resistance initial circuit, means for cutting out the high-resistance circuit and starting the lamp through the low-resistance circuit, and means for restoring the high-resistance circuit and cutting out the low-resistance circuit, when the lamp begins to operate.

6. In an electric-arc lamp, means for preventing excessive tension in the lamp-circuit at the starting of the lamp and for operating the lamp as an ordinary arc-lamp, such means consisting of a low-resistance starting-circuit, a high-resistance initial circuit acting as an inductive restraint upon the first-mentioned circuit, devices for cutting out the starting-circuit when the lamp begins to operate, and devices for cutting in the high-resistance circuit alone as a shunt to the arc for carrying on the operation of the lamp.

7. In an electric-arc lamp, a high-resistance initial circuit connected through a shunt-magnet to one terminal of an electromagnetic cut-out, a second initial circuit of low resistance connected through the same shunt-magnet to one terminal of a second electromagnetic cut-out, means for operating the first-mentioned cut-out, at the starting of the lamp, and thereby breaking the high-resistance circuit, means operated by the low-resistance

ance coils of the shunt-magnet for breaking the circuit of the second cut-out and permitting the restoration of the high-resistance initial circuit for controlling the further operation of the lamp.

8. In an electric-arc lamp, a high-resistance initial circuit connected through a shunt-magnet to one terminal of an electromagnetic cut-out, a second initial circuit of low resistance in inductive relation to the first-mentioned circuit, connected through the shunt-magnet to one terminal of a second electromagnetic cut-out, means for operating the first-mentioned cut-out and thereby breaking the high-resistance circuit, means operated by the low-resistance coils of the shunt-magnet for breaking the circuit of the second cut-out and thereby breaking the low-resistance circuit, and means for short-circuiting the first-mentioned cut-out, and restoring the contacts thereof, whereby the lamp will continue to operate as an ordinary arc-lamp.

9. The combination with an electric-arc lamp, of a double cut-out consisting of a pair of solenoids arranged side by side, a pair of cores therefor, and a pair of springs, each supporting one of the said cores, the cores having free movement within the solenoids, one of the solenoids being in series with the carbons and the other in shunt thereto.

10. The combination with an electric-arc lamp, of a double cut-out consisting of two solenoids arranged side by side, cores for the said solenoids having free movement within the same, and separate springs attached to and supporting the cores, the springs being themselves secured to a common support, one of the said solenoids being in series with the carbons and the other in shunt thereto.

702,893. SHIFTING DEVICE FOR PIERES &c. WILLIAM D. BALDWIN, New York, and AUGUST SUMER, Yonkers, N. Y., assignors to Otis Elevator Company, East Orange, N. J., a Corporation of New Jersey. Filed Dec. 17, 1901. Serial No. 58,398. (No model.)

Claim.—1. The combination with a capstan, and its shaft, of a driving-disk upon the said shaft, a motor provided with a shaft supporting pinions on opposite sides of the shaft of the capstan, and means for swinging the motor to bring one or the other of the pinions into frictional engagement with the disk, substantially as set forth.

2. The combination with a capstan, and its shaft, of a driving-disk upon the said shaft, a motor provided with a shaft supporting pinions on opposite sides of the shaft of the capstan, means for swinging the motor to bring one or the other of the pinions into frictional engagement with the disk, and means for shifting the pinions to vary the speed imparted to the disk, substantially as set forth.

3. The combination with a capstan, its shaft, and disk, of a motor adapted to turn in one direction only arranged below the disk and supported upon trunnions, a shaft extending to opposite sides and carrying pinions 10, 12, and means for rocking the motor to bring either pinion into frictional engagement with the disk, substantially as set forth.

4. The combination with a capstan, disk, motor arranged below the disk and provided with pinions 10, 12, of supports for the motor adapting it to swing therein, and means extending to a position adjacent to the capstan for swinging the motor, substantially as set forth.

5. The combination of a capstan, shaft, disk, and motor supported upon trunnions below the disk and provided with pinions 10, 12, rods extending upward to a position adjacent to the capstan, and connections between the rods and frame of the motor, whereby the motor may be swung by pressure upon the rods, substantially as set forth.

6. The combination with a capstan, disk, swinging motor provided with pinions, and devices for swinging the motor from a position adjacent to the capstan, of a device *B* arranged adjacent to the capstan and

connected to shift the pinions in respect to the center of the disk, substantially as and for the purpose set forth.

702,894. RUBBER-DAM HOLDER. EDWARD H. BELL, St. Louis, Mo. Filed Mar. 27, 1902. Serial No. 100,348. (No model.)

Claim.—1. A dam-holder comprising a body portion having hooks thereon adapted to engage the mouth, substantially as described.

2. A dam-holder comprising a body portion having adjustable hooks thereon adapted to engage the mouth, substantially as described.

3. A dam-holder comprising a flexible body portion having hooks thereon for engaging the mouth, substantially as described.

4. A dam-holder comprising a body portion having fastening devices for holding a rubber dam and also having hooks thereon adapted to hold said body portion in position, substantially as described.

5. A dam-holder comprising a body portion and hooks thereon adapted to engage the mouth, said body portion being arranged to vary the distance between said hooks, substantially as described.

6. A dam-holder comprising a body portion and hooks thereon adapted to engage the mouth, said body portion being arranged to vary the distance between said hooks, and a device for locking said body portion as desired, substantially as described.

7. A dam-holder comprising a body portion, hooks adjustably secured on said body portion and adapted to engage the ends of the mouth, and means on said body portion for engaging the dam, substantially as described.

702,895. SHAW-CORD FASTENER. EDWARD L. BAKERMAN, Brooklyn, N. Y. Filed Mar. 27, 1901. Serial No. 65,388. (No model.)

Claim.—1. A Shaw-cord fastener consisting of a plug adapted to be interposed between the cord and its pulley to choke the aperture in the face-plate through which the cord runs, means for placing the plug between the cord and the pulley and means for retracting the plug to position after use.

2. A Shaw-cord fastener consisting of a plug adapted to press upon the cord and choke the aperture between the cord and the face-plate through which the cord runs in combination with elastic means for normally holding the plug away from the cord.

702,896. SUSPENDER-END. WILLIAM BLOOMING, New York, N. Y. Filed Dec. 18, 1901. Serial No. 66,411. (No model.)

Claim.—1. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise to form a pendant drawer-support.

2. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise to form a drawer-support, and said support being secured to hang intermediate the edges of the tabs.

3. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise to form a drawer-support, and said support being secured to hang intermediate the edges of the tabs on the inner side thereof.

4. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise to form a drawer-support, and said support being secured to hang intermediate the edges of the tabs and provided with attaching means to a garment.

5. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise to form a drawer-support, and said support being secured to hang intermediate the edges of the tabs and provided with a clamp for attachment to a garment.

6. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise a suitable distance from each edge thereof to form duplicate appendages or drawer-supports, and means uniting the lower ends of said appendages adapted for attachment to a garment.

7. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise a suitable distance from each edge to form duplicate appendages or drawer-supports, said supports being secured to hang within the edges of the tabs at the inner side thereof, and means uniting the free ends of said appendages adapted for attachment to a garment.

8. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise a suitable distance from each edge to form duplicate appendages or drawer-supports, said supports being fixed outwardly and secured to hang intermediate the edges of the tabs, and means uniting the supports at their lower ends and maintaining the flexure thereof, said means being adapted for attachment to a garment.

9. A suspender-end comprising tabs for attachment to trousers, one of said tabs being slit lengthwise a suitable distance from each edge to form duplicate appendages or drawer-supports, said supports being fixed outwardly and secured to hang within the edges of the tabs, and a clamp uniting the supports at their lower ends and maintaining the flexed relation thereof, said clamp being provided with a clamp for attachment to a garment.

10. A blank from which to form suspender-ends combining both a trousers-support and a drawer-support, the same comprising a suitable strip formed with buttonholes at the ends and slit from one end only thereof a suitable distance from the edge.

702,897. BLIND-FASTENING DEVICE. HATHAN O. BURN, Hingham, Mass. Filed Aug. 2, 1901. Serial No. 71,474. (No model.)

Claim.—1. In a blind-fastener device, a cylindrical casing, legs bent inward from the sides of said casing, also formed by bending inward said legs, a pivoted catch adapted to extend through said casing, and engage a fixed member, and springs mounted between the legs and the

JUNE 17, 1902.

catch to force it into engagement with the fixed member substantially as described.

2. In a blind-fastener device the combination of a double-ended pivoted catch, a cylindrical casing, legs bent inward from said casing slots through which the ends of the catch project, springs mounted on the catch, and carried by the legs, and an extender or rod by means of which the catch may be forced against the pressure of the springs.

702,398. SUPPORTING DEVICE. EVA M. BOWYER, Chicago, Ill. Filed June 18, 1901. Serial No. 64,784. (No model.)

Claim.—As an article of manufacture, a relatively broad strap of flexible material, one end thereof being adapted to depend over a belt or the like and provided with glove-buttons for fastening the same thereon and having near its other end a plurality of elastic straps or bands having the ends thereof projecting on opposite margins of the strap and having complementary fastening means on the ends thereof, said strap being materially reduced in width at the point of connection therewith with said elastic straps.

702,399. LIFE-BOAT. LAMUEL BROWN, Bangor, Mich. Filed June 7, 1901. Serial No. 63,953. (No model.)

Claim.—1. The herein-described life-boat comprising a central compartment and end sections, a false bottom, a pivotally-mounted floor-section in the form of an auxiliary boat suspended from above and above the false bottom, and means for adjusting the height of said floor-section and allowing it to rock to compensate for the rocking movement of the boat, all substantially as shown and described.

2. In boats of the character specified, a water-tight opening comprising the disk 19 suitably secured in the wall of the boat and having a central opening and a yielding closure for said opening formed of rubber or the like said closure adapted to serve as a water-tight closure and affording the sole support for an ear having an opening adapted to tightly receive the handle of an ear whereby the ear may be operated without admitting water to the boat all substantially as specified and for the purpose set forth.

702,400. METALLIC RAILWAY-TIE. CAMPER BURNER, Sandusky, Ohio. Filed Aug. 7, 1901. Serial No. 71,348. (No model.)

Claim.—1. A metallic railway-tie comprising a single, vertical, integral web, top flanges extending each side of the web and presenting a plain level surface to receive track-rails, bottom flanges extending each side of the web and of greater width than the top flanges, and anchoring means projecting from the under surface of the lower flanges of the tie, and extending crosswise thereof; the said top flanges adjacent the ends, where they are to receive the flanges or bases of the track-rails, being integral and of the same width as the other portions of the top flanges.

2. A metallic railway-tie having a web, top flanges, bottom flanges, and depressions formed in the lower flanges to serve as anchoring means.

3. The combination with a metallic railway-tie having a single, vertical, integral web, top flanges with holes each side of the web, bottom flanges, and anchoring means at the lower flanges extending crosswise of the tie and projecting downwardly, of track-rails, perforated clamping-

plates; and bolts; the said clamping-plates being located upon the top plain surface of the flanges of the tie and being provided with lips which engage the base of the track-rail.

702,401. SEED-PLANTER. HENRY L. CARAWAY, Piquette, Ark. Filed Sept. 20, 1901. Serial No. 70,890. (No model.)

Claim.—1. In a seed-planter, the combination with a seed-plate, of operating mechanism adjustable to effect differential movements of the said plate.

2. In a seed-planter, the combination with the seed-plate, of reciprocating mechanism adjustable to effect differential movements of the said plate.

3. In a seed-planter, the combination with the seed-plate, of reciprocating mechanism adjustable from an approximately vertical to an approximately horizontal plane, whereby to increase or decrease the throw of the said plate in accordance with the work to be done.

4. In a seed-planter, means for imparting differential rates of movement to the seed-plate, comprising a motion-imparting member, a reciprocating member associated therewith, a vibratory member operatively connected with the motion-imparting member and the reciprocating member, means for changing the working planes of the latter member thereby to vary the throw of the vibratory member, and connections between the reciprocating member and the seed-plate.

5. In a seed-planter employing two seed-plates, means for imparting like or differential rates of reciprocation to the plates, comprising a crank-shaft, slide-rods mounted on the terminals thereof, pitman-rods mounted on the crank and connecting with the slide-rods intermediate of their ends, slide-rod-shifting means, and connections between the slide-rods and the seed-plates.

6. In a seed-planter, a seed-hopper, seed-plates arranged therein and having seed-escape openings of different sizes, and reciprocating mechanism connected with the said plates and adjustable to effect differential movements thereof.

7. In a seed-planter, a frame supporting a seed-hopper, a crank-shaft

JUNE 17, 1902.

U. S. PATENT OFFICE.

2559

journalled in suitable bearings on the frame and carrying the frame-supporting wheels, slide-rods mounted on the terminals of the shaft, pitman-rods mounted on the crank and connecting with the rods intermediate of their ends, seed-plates carried by the hopper, connections between the seed-plates and the slide-rods, and rock-levers carrying guides engaged by the upper terminals of the slide-rods and provided with means whereby the said slide-rods may be locked at any desired adjustment.

8. In a seed-planter, two seed-plates, in combination with means for imparting like or differential rates of reciprocation thereto.

9. In a seed-planter, two seed-plates having different-sized seed-escape openings, in combination with means for imparting like or differential rates of reciprocation to the said plates.

10. In a seed-planter, a rock-lever movable about a fixed axis and including locking mechanism, a slide-rod carried by the lever, a seed-plate, means for pivotally connecting the slide-rod and the seed-plate, and means for imparting a reciprocating motion to the slide-rod.

702,402. SEED-DRILL. ALBERT CHAPMAN, Warsaw township, Seneca county, Kans. Filed Jan. 2, 1901. Serial No. 41,804. (No model.)

Claim.—1. In a seed-drill, the combination of a wheeled frame, having seed-dropping mechanism, a seed-planting mechanism below and connected to the same, comprising a collar at its front end, a covering-wheel at its rear end, a shoe between and in line with the collar and covering-wheel and provided with a seed-escap, and parallel bars connecting the shoe, the collar, and the covering-wheel, headed rods pivoted at their lower ends to and near the opposite ends of said bar, and provided with shoulders, on cybers slidingly connecting said rods, spiral expansive springs upon said rods and engaging said shoulders and cybers at their opposite ends, a pair of rock-shafts provided with crank-arms pivotally connected to said cybers at their free ends, and means to operate said rock-shafts and secure them at the desired point of adjustment, substantially as described.

2. In a seed-drill, a frame consisting of a pair of parallel bars a furrow-making device carried at the front end and centrally of the space between said bars, a furrow-closing device centrally and secured at the rear end of said frame, and a drill-chase interposed between said furrow making and closing devices and consisting of a perforated thin front portion arranged centrally of said bar, a bracketed rear portion, a base-plate surrounding and adapted to discharge into the chamber formed between the shoulders or walls of the rear portion, and provided with a rearwardly-projecting perforated rib, a clamping-bolt extending through said bar and one of the perforations of the front portion, sleeves upon said bolt between said portion of the shoe and said bar, a clamping-bolt extending through said bar and one of the perforations of the rib, and sleeves upon said bolt between said rib and said bar, substantially as described.

702,403. VALISE, HAND-BAG, OR SUIT-CASE. SAMUEL D. CHAPMAN, Kansas City, Mo. Filed Apr. 7, 1902. Serial No. 101,708. (No model.)

Claim.—1. In a valise, suit-case, grip, or hand-bag, the combination of an opening in one end thereof, a lens behind said opening, an electric lamp behind said lens, a battery, a handle, a pair of contact-springs therein, connected to the respective handle-rings, and connections between the handle-rings, the battery and the lamp, whereby the lamp will be lighted when said springs in the handle are in contact with each other; substantially as described.

2. In a valise, suit-case, grip or hand-bag, the combination of an opening in one end thereof, a lens behind said opening, a box, a ring outside of said opening, bolts secured to said ring and passing through the box, an electric lamp behind said lens, a reflector between the lens and lamp, a battery in said box, a handle, a pair of contact-springs therein, connected to the respective handle-rings, a wire connecting said lamp to one of the handle-rings, a wire connecting the other handle-ring to the battery, and a wire connecting the battery to the lamp; substantially as described.

702,404. MOTOR. HILAIRE DE CHARDONNET, Paris, France. Filed Apr. 12, 1900. Serial No. 712,580. (No model.)

Claim.—1. In a motor-engine, the combination of a pair of solid pistons arranged to balance each other on opposite sides of a shaft and arranged to oscillate in two opposite quadrants of a spherical casing, and a device for the introduction and discharge of the motor-fluid arranged in each of the spaces between said quadrants and connected to each of said quadrants, substantially as described.

2. In a motor-engine the combination of a pair of solid pistons arranged to balance each other on opposite sides of a shaft, a pair of opposite quadrant-chambers in which said pistons are arranged to oscillate, a device for the introduction and discharge of the motor fluid arranged in each of the spaces between said quadrants and connected to each of said

quadrants, means for cutting off the supply of fluid at a determined point of the stroke or as to effect expansion, and means for admitting the fluid simultaneously and symmetrically into the opposite chambers.

702,405. INCLOSED-ARC LAMP. WALTER L. CHERRY and GEORGE R. DAVISON, Newark, and ROBERT W. SKINNER, Arlington, N. J., assignors to Westinghouse Electric and Manufacturing Company, a Corporation of Pennsylvania. Filed Jan. 6, 1902. Serial No. 98,480. (No model.)

Claim.—1. In an inclosed-arc lamp, a pair of carbons, a gas-check, a globe surrounding the meeting-point of the carbons, and an open tube extending from the neighborhood of the arc to a point above the gas-check.

2. In an inclosed-arc lamp, a pair of carbons, a gas-check, a globe surrounding the meeting-point of the carbons, and a tubular support for the lower carbon, said tubular support being open at the top, closed at the bottom, and having a side opening communicating with the top opening through an air-passage.

3. In an inclosed-arc lamp, a gas-check, and a side rod extending therefrom and forming a support for the lower carbon, the said side rod being provided with an opening extending from the neighborhood of the arc to a point above the gas-check.

4. In an inclosed-arc lamp, a side rod forming a support for the lower carbon, and provided with an opening extending from a point in the rod between the ends thereof to a point above the gas-check.

5. In an inclosed-arc lamp, a pair of carbons, a transparent globe surrounding the meeting-point of the carbons, a pair of side rods supporting the lower carbon, the said rods being curved to conform to the inner curve of the lamp-globe, one of the side rods being provided with a side perforation which connects through an air-passage with an opening above the gas-chamber.

6. In an inclosed-arc lamp, a gas-check, a pair of carbons, a transparent globe surrounding the meeting-point of the carbons, the said globe being constricted at its mouth and provided with a curved lower portion, a pair of side rods having a curve corresponding to the inner curve of the globe, the said side rods being attached to the gas-check at points less than one hundred and eighty degrees apart.

7. In an inclosed-arc lamp, a gas-check, a pair of carbons, a transparent globe surrounding the meeting-point of the carbons, the said globe being constricted at its mouth and provided with a curved lower portion, a pair of side rods having a curve corresponding to the inner curve of the globe, the said side rods being attached to the gas-check at points approximately ninety degrees apart.

702,406. HYDROCARBON-BURNING SYSTEM. FREDERICK A. CURT and ROBERT D. CURT, Chicago, Ill. Filed May 29, 1901. Serial No. 98,582. (No model.)

Claim.—1. The combination of a reservoir, a plurality of tanks ar-

ranged below said reservoir, a valve-casing, a distributing-pipe connected to each casing, and pipes connecting said reservoir and tanks to each casing, a multiway valve-pipe in the casing arranged to be turned to connect either of said tanks to the distributing-pipe and the other tank to the reservoir, and a connection between the upper end of each tank and the reservoir.

2. In fluid-delivery apparatus, the combination with a supply-tank, of plural delivery-tanks, suitable pipes for passage of gasolene or like liquid connecting said delivery-tanks to said supply-tank and with a discharge-main, equalizing-pipes extending between said supply-tank and said delivery-tanks, and suitable valve mechanism whereby when the supply of gasolene or like liquid is admitted from the supply-tank to one of said delivery-tanks connection between said supply-tank and the other of said delivery-tanks is cut off and said delivery-tank thus cut off from the supply-tank is placed in communication with the delivery-main.

702,407. MOTOR-GENERATOR. PATRICK J. COLLIER, Scranton, Pa., assignor of one-half to Christopher G. Schmid, Scranton, Pa. Filed Oct. 11, 1901. Serial No. 78,572. (No model.)

Claim.—1. In a motor-generator, an armature having a direct-current winding, and a commutator therefor, secondary direct-current windings, and a commutator to which said latter windings are connected, insulated rings carried by the armature-shaft and connected to opposite sections of one of said commutators, an inductor upon the armature-shaft, field-poles opposite said inductor, primary and secondary field-coils upon said poles, an electrode-circuit connected to said secondary field-coils, and a switch arranged to connect said primary field-coils with the secondary commutator or the insulated rings, as desired.

2. In a motor-generator, an armature having a direct-current winding and a commutator therefor, secondary direct-current windings and a commutator to which said latter windings are connected, insulated rings carried by the armature-shaft and connected to opposite sections of one of said commutators, an inductor upon the armature-shaft, field-poles opposite said inductor, primary and secondary field-coils upon said poles, an electrode-circuit connected to said secondary field-coils, a regulating device in the primary field-coil circuit adapted to vary the ohmic or inductive resistance of the same, and a switch arranged to connect said primary field-coils with the secondary commutator or the insulated rings, as desired.

3. In a motor-generator, an armature having a direct-current winding, and a commutator therefor, secondary direct-current windings, and a commutator to which said latter windings are connected, insulated rings carried by the armature-shaft and connected to opposite sections of one of said commutators, an inductor upon the armature-shaft, field-poles opposite said inductor, primary and secondary field-coils upon said poles, an electrode-circuit connected to said secondary field-coils, a switch arranged to connect said primary field-coils with the secondary commutator or the insulated rings, as desired, and means for varying the speed of the motor.

4. In a motor-generator, an armature having a direct-current winding and a commutator therefor, secondary direct-current windings and a commutator to which said latter windings are connected, insulated rings carried by the armature-shaft and connected to opposite sections of one of said commutators, an inductor upon the armature-shaft, field-poles opposite said inductor, primary and secondary field-coils upon said poles, an electrode-circuit connected to said secondary field-coils, a regulating de-

vice in the primary field-coil circuit adapted to vary the ohmic or inductive resistance of the same, a switch arranged to connect said primary field-coils with the secondary commutator or the insulated rings, as desired, and means for varying the speed of the motor.

5. In a motor-generator, an armature having a direct-current winding, and a commutator therefor, secondary direct-current windings, and a commutator to which said latter windings are connected, insulated rings carried by the armature-shaft and connected to opposite sections of one of said commutators, an inductor upon the armature-shaft, field-poles opposite said inductor, primary and secondary field-coils upon said poles, an electrode-circuit and switch arranged to connect said electrode-circuit with the secondary field-coils, the secondary commutator is the insulated rings, as desired.

6. The combination with a motor-generator arranged to produce direct and alternating currents, of an inductor upon the armature-shaft of said motor-generator, said inductor having teeth or projections upon its periphery, field-poles opposite said inductor, primary and secondary windings in inductive relation to one another upon said field-poles, means for passing either a direct or alternating current from said motor-generator through the primary coils, a device arranged to insert either an inductive or ohmic resistance in said primary coils, and an electrode-circuit connected to the secondary coils, and means for varying the speed of the motor-generator.

702,408. CONVEYER. JOHN H. COOK, Brooklyn, N. Y., assignor to Henry B. Newhall, Plainfield, N. J. Filed Dec. 28, 1901. Serial No. 98,597. (No model.)

Claim.—1. In a conveyer system, a feeder-conveyer extending longitudinally of a building mounted in a substantially central position therein upon the roof-trusses of the same, said feeder-conveyer comprising slats supported by trolleys and sprocket-chains, an inclined throw-off board adjustably mounted upon said feeder-conveyer and bodily-movable distributor-conveyers provided with throw-off boards on either side of said feeder-conveyer.

2. In a conveyer system, a hoist, an inclined trough communicating with said hoist, two feeder-conveyers with either of which said trough may communicate extending longitudinally of a building, ejectors adjustably mounted on said feeder-conveyers, distributor-conveyers bodily movable longitudinally of said feeder-conveyers to receive material therefrom and ejectors adjustably mounted on said distributor-conveyers.

3. In a conveyer system, a feeder-conveyer, an ejector adjustably mounted on said feeder-conveyer to eject material therefrom, a distributor-conveyer bodily movable longitudinally of said feeder-conveyer to receive material ejected from said feeder-conveyer and an ejector mounted on said distributor-conveyer to eject material therefrom.

4. In a conveyer system, a feeder-conveyer comprising self-aligning trolley-trucks, slings secured to said trolley-trucks, sprocket-chains, conveyer-slats, brackets secured at either end of said conveyer-slats, said brackets being secured to said sprocket-chains, trolleys secured to part of said brackets and engaging said trolley-trucks and an inclined throw-off board adjustably mounted upon said conveyer, said throw-off board being provided with inclined guides.

5. In a conveyer, sprocket-chains, brackets having slats rigidly secured thereto and connected to said sprocket-chains, means to support part of said brackets rigidly and means to yieldingly support the rest of said brackets and an inclined throw-off board adjustably mounted with respect to said conveyer to engage material upon said slats and to eject the same from said conveyer, said material being engaged by the front edge of said rigidly-supported slats to prevent said material slipping back along said slats.

6. In a conveyer, a series of slats, means to move said slats forward in unison, means to rigidly support part of said slats, means to yieldingly support the rest of said slats, an ejector adjustably mounted to cooperate with said slats to remove material laterally from said slats, said material being engaged by the front edge of said rigidly-supported slats and being forced thereby into contact with said ejector.

7. In a conveyer, a series of slats, means to horizontally move said slats in unison, means to rigidly support part of said slats, means to support the rest of said slats to allow them to assume a position below the rigidly-supported slats, a stationary facing adjacent the ends of said slats and a throw-off board adjustably mounted in an inclined position to cooperate with said slats.

8. In a conveyer, a series of slats, means to move said slats in unison, an ejector mounted adjacent said slats to crowd material off the same, means to rigidly support part of said slats during their movement and means to yieldingly support the rest of said slats during their movement.

9. In a conveyer, conveying means and an inclined throw-off board adjustably mounted with respect to said conveying means, said throw-off board being provided with a series of upwardly-inclined guides upon its face to engage an article and crowd the same laterally from said conveying means.

10. In a conveyer, a series of slats, means to move said slats in unison, an inclined throw-off board mounted adjacent said slats to engage articles on said slats, and means on said throw-off board to raise said articles as they are being forced laterally from said slats.

11. In a conveyer, a series of slats, means to move said slats and an inclined throw-off board adjustably mounted with respect to said slats to engage material and crowd the same laterally from said slats, said throw-off board being provided with vertically-inclined guides.

12. In a conveyor, self-aligning trolleys and tracks, a series of connected slats supported by said trolleys, slings secured to said tracks adjacent said slats and an ejector to cooperate with said slats to force material laterally therefrom.
13. In a conveyor, self-aligning trolleys and tracks, a series of slats supported by said trolleys, and means to force material laterally from said slats.
14. In a conveyor, self-aligning trolleys and tracks, and a series of conveying-slats mounted between said tracks and supported by said trolleys.
15. In a conveyor, trolley-tracks, trolleys to engage said tracks, means to maintain the lateral alignment of said trolleys and tracks, a series of slats supported by said trolleys and means to force material laterally from said slats.
16. In a conveyor self-aligning trolleys and tracks and a conveying surface mounted between said tracks and supported by said trolleys.

702,409. MULTIPLE SWITCH. HENRY H. CUTLER, Milwaukee, Wis. Filed Apr. 17, 1901. Serial No. 94,948. (No model.)

- Claim.—1. The combination with a plurality of independently-actuated manual switches arranged in a series, of means for preventing the closure of the same except in a definite order, and means for automatically opening the same, substantially as described.
2. The combination with a plurality of independently-actuated manual switches arranged in a series, of means for preventing the closure of the same except in a definite order, and means for automatically opening the same in a definite order, substantially as described.
3. The combination with a plurality of independently-actuated manual switches arranged in a series, of means for preventing the closure of the same except in a definite order, and means for opening all of said switches, substantially as described.
4. The combination with a rheostat, of a plurality of independently-actuated manual switches for controlling the resistance thereof, means for preventing the closure of said switches, except in a definite order, and means for automatically opening said switches, substantially as described.
5. In a rheostat, the combination with a plurality of independently-actuated manual switches for controlling the resistance thereof, of means for preventing the closure of said switches except in a definite order, and means for opening said switches in a definite order, substantially as described.
6. The combination with a plurality of switches arranged in a series, of retaining mechanism for holding said switches in the closed position, and means for releasing the said retaining mechanism, substantially as described.
7. The combination with a plurality of manual switches arranged in a series, of electromagnetic retaining mechanism for holding the same in the closed position, and means for actuating said electromagnetic retaining mechanism to cause the release of said switches, substantially as described.
8. The combination with a plurality of switches arranged in a series, of means for preventing the closure of the same except in a definite order, retaining mechanism for holding said switches in a closed position, and means for automatically actuating said retaining mechanism to release said switches, substantially as described.
9. The combination with a plurality of switches arranged in a series, of interlocking mechanism whereby each switch controls the next succeeding switch and an electromagnetic retaining device for the first switch of the series, substantially as described.

10. The combination with a plurality of switches arranged in a series, of interlocking mechanism whereby each switch controls the next succeeding switch, a retaining-electromagnet for holding the first switch of the series in a closed position, and means for controlling said retaining-magnet, substantially as described.
11. The combination with a plurality of switches, of a plurality of independent interlocking devices for preventing the closure of the switches except in a definite order, substantially as described.
12. The combination with a plurality of switches, of a plurality of independent interlocking devices for preventing the closure of the switches, except in a definite order, and means carried by the switches for operating the interlocking devices, substantially as described.
13. The combination with a plurality of switches, of a plurality of independent interlocking devices for preventing the closure of the switches except in a definite order, and means carried by each switch for operating the interlocking device associated therewith to permit the closure of the succeeding switch, substantially as described.
14. The combination with a plurality of switches arranged in a series, of interlocking mechanism for preventing the closure of the switches except in a definite order, and retaining means for holding the switches in the closed position, substantially as described.
15. The combination with a plurality of switches, of interlocking devices for preventing the closure of the switches except in a definite order, and means associated with the interlocking devices for retaining the switch in its closed position only when the immediately-preceding switch has been closed, substantially as described.
16. The combination with a plurality of switches, of an interlocking device controlled by each switch and adapted upon the closure of said switch to serve as a retaining device for the next succeeding switch, substantially as described.
17. The combination with a plurality of switch-arms, of a mechanical retaining device adapted to hold the switch in the closed position and constructed to release said switch unless the immediately-preceding switch has been closed, substantially as described.
18. The combination with a plurality of switches, of a plurality of rocking dogs adapted to be moved into the retaining position by the closure of one switch to thereby retain the next succeeding switch in the closed position, substantially as described.
19. The combination with a plurality of switches each carrying a latch, of a retaining device adapted to be engaged by said latch to hold the switch-arm in a closed position, and means controlled by the closure of a preceding switch for placing said retaining device in position to be engaged by said latch, substantially as described.
20. The combination with a plurality of switches arranged in a series, of a retaining-magnet for holding the first switch in the closed position, and interlocking device controlled by said first switch for retaining the succeeding switch in position, substantially as described.
21. The combination with a plurality of switches, of a retaining-magnet for holding the first switch in the closed position, and a plurality of interlocking devices for holding the remaining switches in the closed position, substantially as described.
22. The combination with a plurality of switches arranged in a series, of a retaining-magnet for holding the first switch in position, means controlled by said first switch for holding the remaining switches in position, and means for automatically opening all of the switches when released by said retaining-magnet, substantially as described.
23. The combination with a plurality of switches, of a plurality of pivoted blocks or dogs limited in their movement and provided with an upwardly-extending lip at one end of the front edge thereof and having the lower opposite corner thereof cut away, substantially as described.
24. The combination with a plurality of switches, of a plurality of interlocking devices preventing the closure of the switches except in a definite order, and means controlled by each switch for placing said interlocking devices in position to retain the next succeeding switch in the closed position, substantially as described.
25. The combination with a plurality of switches, of means for opening the circuit therethrough when part of the switches remain unclosed for a time longer than a predetermined period, substantially as described.
26. The combination with a plurality of switches, of electromagnetic retaining means for holding the same in a closed position and means for releasing said switches when a part of the switches remain unclosed for a time longer than for a predetermined period, substantially as described.
27. In a rheostat, the combination with a plurality of switches, of means operated by the abnormal heating of the resistance for opening the switches when part of the same remain unclosed for a longer time than a predetermined period, substantially as described.
28. In a rheostat, the combination with a plurality of switches, of electromagnetic retaining mechanism for holding the same in the closed position, and means responsive to an abnormal heating of the resistance

- for actuating said electromagnetic retaining device to cause the release of said switches, substantially as described.
29. In a rheostat, the combination with a plurality of switches, of electromagnetic retaining mechanism for holding the same in the closed position and an electromagnetic device connected in parallel with a portion of the resistance of the rheostat for controlling said retaining device, substantially as described.
30. The combination with a plurality of like manual switches adapted to be independently actuated, of means for preventing the closure of the same except in a definite order, and means for automatically opening all of said switches, substantially as described.
31. The combination with a plurality of like switches, of means for preventing the closure of the same except in a definite order, retaining mechanism for holding said switches in a closed position, and means for automatically operating said retaining mechanism to release said switches, substantially as described.
32. The combination with a rheostat, of a plurality of like manual switches for controlling the resistance thereof and adapted to be independently actuated, means for preventing the closure of said switches except in a definite order, and means for automatically opening said switches, substantially as described.
33. The combination with a base-board, of a series of switches mounted in alignment upon said base-board, and interlocking mechanism whereby each switch controls the next succeeding switch of the series and means for automatically opening said switches, substantially as described.
34. The combination with a base-board, of a plurality of independent manual switches mounted in alignment thereon, a rheostat having its resistance controlled by said switches, and means to prevent the closure of said switches except in a definite order, and further means for automatically opening said switches, substantially as described.
35. The combination with a base-board, a plurality of switches mounted thereon, a common bar for said switches upon which they are loosely journaled, suitable supports for said bar, and means to prevent the closure of the switches except in a definite order, and means for opening all of said switches, substantially as described.
36. The combination with a base-board, brackets mounted thereon, a common pivot-bar extending between the brackets, a plurality of switches pivoted upon said bar, and a common stop-bar also carried by said brackets with which said switches are adapted to engage to limit their outward movement, substantially as described.
37. The combination with a vertical base-board, of a plurality of like levers mounted in alignment upon one face thereof and adapted to move in planes perpendicular to the said face, means for preventing the closure of the same, except in a definite order, a retaining means for holding said switches in closed position, and means to automatically open said switches, substantially as described.
38. The combination with a base-board, of a plurality of switches mounted in alignment on the face of said board and adapted to be moved perpendicularly thereto, a common circuit-terminal on said board and extending beneath all of said switches, an individual terminal for each switch also mounted upon the board, and bridging contact members carried by the switches and each adapted to electrically connect the common terminal with the proper individual terminal when the switches are closed, substantially as described.
39. The combination with a vertical base-plate, a plurality of like switch-levers mounted upon said plate and adapted to swing outward from the face of the plate, each switch carrying a bridging contact member, a common circuit-terminal carried by the said plate and extending by all of said switches, individual circuit-terminals also carried by said plate beneath each of the said switches, the said bridging members being adapted to connect the common bar with the individual circuit-terminals, a retaining means to hold the said switches closed and means to cause the switches to fall outward from the base-board when the retaining means is released, substantially as described.
40. The combination with a vertical base-board, of a plurality of like switches pivoted in alignment at their lower ends upon said board and adapted to fall outward by gravity, retaining-catches for said switches to hold them against the face of the board and means for preventing the closure of said switches except in a definite order, substantially as described.
41. The combination with a pivoted lever, of a magnetic retaining means to hold the same in one position, said means comprising a catch member out of the field of the magnet when the switch is opened, but adapted to be brought within the field by the switch itself when the switch is closed and to thereafter retain the lever in closed position, substantially as described.
42. The combination with a base-board, of a plurality of levers mounted thereon interlocking retaining-catches for said levers, and a common bar on which said catches are mounted, substantially as described.
43. The combination with a vertical base-board, of a plurality of like

- levers pivoted at their lower ends upon said base-board, a catch for each lever extending out from the face of said board and adapted to engage the lever near its upper end, a common bar upon which said catches are mounted, and suitable stops carried by the catches and adapted to engage the face of the plate, whereby they are allowed a limited vibration, substantially as described.
44. The combination with a plurality of like switch-levers mounted in alignment, interlocking mechanism to prevent the closure of the same except in a definite order, means to automatically open said switches and circuit terminals for the first switch of the series, substantially as described.
45. The combination with a rheostat, of a plurality of like switch-levers controlling the resistance thereof, said manual switches being independently actuated, means to prevent the closure of said switches except in a definite order, means for automatically opening said switches, circuit switching-terminals for the first lever of the set, and means to prevent the opening or closing of the circuit except through said first lever, substantially as described.
46. The combination with a rheostat, of a plurality of manual switches each controlling an individual section of the resistance thereof, means for preventing the closure of said switches except in a definite order and means for opening all of said switches within a short interval of time, substantially as described.
47. The combination with a rheostat, of a plurality of manual switches each controlling an individual section of the resistance thereof, means for preventing the closure of said switches except in a definite order, and means for effecting the rapid opening of all of said switches, substantially as described.
48. The combination with a rheostat, of a plurality of manual switches each controlling an individual section of the resistance thereof, means for preventing the closure of said switches except in a definite order, and electrically-controlled means for opening said switches, substantially as described.
49. The combination with a rheostat, of a plurality of switches, each controlling an individual section of the resistance thereof, means for preventing the closure of said switches except in a definite order and electrical means for effecting the opening of said switches when the current therethrough becomes abnormal, substantially as described.
50. The combination with a rheostat, of a plurality of switches, each controlling an individual section of the resistance thereof, means for preventing the closure of said switches except in a definite order, and electrical means for opening said switches when the current therethrough tends to abnormally heat the apparatus, substantially as described.
51. The combination with a rheostat, of a plurality of manual switches, each controlling an individual section of the resistance thereof, means for preventing the closure of said switches except in a definite order and electrical means for opening said switches when the current therethrough falls below a predetermined limit, substantially as described.
52. The combination with a rheostat, of a plurality of switches each controlling an individual section of the resistance thereof, means for preventing the closure of said switches except in a definite order, a magnet responding to a current tending to abnormally heat the apparatus for effecting the opening of said switches, and a magnet responding to an under-current for effecting the opening of said switches, substantially as described.
53. The combination with a plurality of like electrical elements to be connected in varying relations, of a plurality of switches each controlling one of said like elements, means for preventing the closure of said switches except in a definite order, and means for effecting the opening of said switches, substantially as described.
54. The combination with a suitable base-plate, of a plurality of switches mounted in alignment thereon, and adapted to move perpendicularly to the face of said plate, and suitable means for breaking the shock upon the fall of said switches, substantially as described.
55. The combination with a base, of a plurality of switches mounted in alignment thereon, and adapted to move perpendicularly to the face of said plate, and a rod carrying a rubber covering adapted to serve as a buffer to break the fall of said switches, substantially as described.
56. The combination with a base-plate, of terminals mounted thereon, a plurality of switches adapted to move perpendicularly to the face of said plate and leaf-contacts carried upon each of said switches, said leaf-contacts being secured to the switch at the middle and having free ends adapted to engage said terminals and suitable retaining mechanism for normally maintaining said switches in a closed position, substantially as described.
57. The combination with a plurality of manual switches arranged in a series, of means for preventing the closure of the same except in a definite order, and means for automatically opening the same, substantially as described.
58. The combination with a plurality of like manual switches arranged in a series, of means for preventing the closure of the same except in a

definite order, and means for automatically opening all of said switches, substantially as described.

702,410. ENGINE CONTROLLING MECHANISM. OTTO F. DANKENBERG and RALPH L. MORRIS, Toledo, Ohio, assignors to American Meyeke Company, Jersey City, N. J., and New York, N. Y., a Corporation of New Jersey. Filed Dec. 19, 1901. Serial No. 90,482. (No model.)

Claim.—1. In an engine, the combination with the power-controlling mechanism and the reversing mechanism, of a shaft provided with separate means for actuating each of said mechanisms, said actuating means being in different planes and adapted to actuate the controlling mechanism and the reversing mechanism at different times, substantially as described.

2. The combination with the power-controlling and reversing mechanism of an engine, of a controller-shaft provided with a cam engaging the reversing mechanism and with means for actuating the power-controlling mechanism, said cam being adapted to operate the reversing mechanism before the power-controlling mechanism is operated to open the throttle-valve, and means for automatically closing the throttle-valve before the reversing mechanism is returned to its original position.

3. In an engine, the combination with the power-controlling and the reversing mechanism, of a controller-shaft provided with a cam engaging the reversing mechanism to actuate same and with means for actuating the power-controlling mechanism to open the throttle-valve, and means for automatically closing the throttle-valve.

4. The combination with the power-controlling and the reversing mechanism of an engine, of a controller-shaft provided with a cam engaging the reversing mechanism and with means for actuating the power-controlling mechanism being held out of engagement therewith when the controller-shaft is in its non-operative position.

5. The combination with the power-controlling and the reversing mechanism of an engine, of a controller-shaft provided with a cam engaging the reversing mechanism to actuate same, and with a segmental flange adapted to engage with the power-controlling mechanism after the reversing mechanism has been actuated to open the throttle-valve, and a spring for automatically closing the throttle-valve when the controller-shaft is returned toward its non-operative position.

6. In an engine, the combination of a controller-shaft, a cam secured to said shaft having an intermediate actuating portion and end dwell portions, a lever connected with the reversing mechanism and operatively engaging said cam, power-controlling mechanism comprising an arm movably mounted on said shaft and a segmental flange secured to said shaft so as to be held out of contact with the arm when the controller-shaft is in its non-operative position, said flange being adapted to engage with the arm to open the throttle-valve after the reversing mechanism has been actuated.

702,411. FOLDING CRATE FOR POULTRY. ANDREW F. DICK, Joliet, Ill. Filed Mar. 26, 1902. Serial No. 100,080. (No model.)

Claim.—1. The folding crate having posts at its corners pivoted at top and bottom so they may be turned sidewise in the same direction, side slats extending from post to post and pivotally attached thereto so they will permit the changes in position of the posts, and diagonal braces adjustable to positions in which they will retain the crate in its expanded condition, one of said braces being an extensible one, substantially as specified.

2. The folding crate having its posts pivoted at top and bottom so they may be turned sidewise, side slats pivotally attached to the posts, and diagonal braces adjustable to positions in which they retain the crate in its expanded condition, one of said braces being extensible, substantially as specified.

3. The folding crate having posts at its corners pivoted at top and bottom so they may be turned sidewise in the same direction, side slats pivotally attached to said posts and extending from one corner-post to the other corner-post upon the same side, and adjustable and opposing diagonal braces for holding the crate expanded, one of said braces being extensible, substantially as specified.

4. The folding crate having corner-posts pivoted at top and bottom so they may be turned sidewise in the same direction, side slats pivotally attached to said posts and extending from the post at one corner to the post at the other corner on the same side of the crate, an abutment upon the floor of the crate, and opposing braces hinged to the top of the crate and adapted to be positioned so as to bear against the abutment, substantially as specified.

5. The folding crate having its posts pivoted at top and bottom so they may be turned sidewise, side slats pivotally attached to the posts, and slats attached to the posts at the corners, and adjustable oppositely-acting braces for holding the crate expanded, substantially as specified.

6. The folding crate having its posts pivoted at top and bottom so they may be turned sidewise, side slats pivotally attached to the posts, and slats attached to the posts at the corners, and adjustable oppositely-acting braces for holding the crate expanded, the side slats having their ends rounded off, substantially as specified.

702,412. JAR-CLOSURE. FRANK E. DOWDING, Peabody, Ill. Filed Nov. 27, 1901. Serial No. 95,362. (No model.)

Claim.—1. The combination with a jar having an inner marginal groove or seat formed in the neck thereof and provided with back, top and bottom walls and open at its front only, of a thin flat packing-ring of greater width than the depth of the groove with its outer edge seated in the groove and its inner edge projected out of and beyond the open front of the groove or seat, and a closure-plug slightly less in diameter than the inner diameter of the neck of the jar at the lower side of the groove therein, and provided with an intermediate marginal enlargement or flange to bind the packing-ring between the lower outer edge of the groove or seat and the lower edge of the flange, whereby the packing-ring will be pushed up in the neck upon an initial outward movement of the closure-plug and thereby prevent accidental displacement thereof.

2. The combination with a jar having an inner marginal groove or seat formed in the neck thereof, a thin flat packing-ring having its outer edge seated in the groove and its inner edge projected inwardly and downwardly into the neck of the jar, and a closure-plug having its outer end provided with a marginal cap-flange to engage the upper edge of the jar, and an intermediate marginal flange or enlargement to engage the inner projected edge of the packing-ring and bind the same between the

lower edge of the flange and the lower outer edge of the groove or seat in the jar.

3. The combination with a jar, having an inner marginal groove or seat formed in the neck thereof, with the lower side of the groove projected into the neck-opening beyond the upper side thereof, a packing-ring of greater width than the depth of the groove with its outer edge fitted in the groove or seat and its inner edge projected out of the groove, and a closure-plug having a diameter slightly less than that of the neck at the lower side of the groove therein, and also provided with an intermediate marginal enlargement or flange to bind the packing-ring between the lower edge of the groove or seat and the lower side of the flange, whereby the packing-ring will be pushed up in the neck upon an initial outward movement of the closure-plug and thereby prevent accidental displacement thereof.

4. The combination with a jar having an inner marginal groove or seat formed in the neck thereof, the lower side of the groove being projected into the neck and beyond the upper side of the groove, a thin flat packing-ring having its outer edge fitted in the groove and its inner edge projected out of the groove, and a closure-plug of slightly less diameter than the inner diameter of the neck at the lower side of the groove, and provided with an intermediate marginal enlargement or flange having a beveled lower side to bind the packing-ring between said lower side and the lower edge of the groove or seat, and an outwardly-directed marginal cap-flange at the outer end of the plug to overlap the upper edge of the jar.

5. The combination with a jar having an inner marginal groove or seat formed in the neck thereof and provided with back, top and bottom walls, and an open front, of a flat packing-ring of greater width than the depth of the groove, with its outer edge seated in the groove and having its inner edge projected out of and beyond the open front of the groove or seat, and a closure-plug slightly less in diameter than the neck of the jar at the lower side of the groove therein, and capable of frictional engagement with the projected inner edge of the packing-ring to bind the latter between the lower edge of the groove or seat and the plug, whereby the packing-ring will be pushed up in the neck upon an initial outward movement of the closure-plug and thereby prevent accidental displacement thereof.

6. The combination with a jar having an inner marginal groove or seat formed in the neck thereof and provided with back, top and bottom walls, and an open front, of a flat packing-ring of greater width than the depth of the groove, with its outer edge seated in the groove and having its inner edge projected out of and beyond the open front of the groove or seat, and a closure-plug which has a reduced end, an intermediate external diameter capable of frictional engagement with the projected inner edge of the packing-ring to bind the latter between the lower edge of the groove or seat and the plug, and a cap-flange to overlap the outer edge of the neck of the jar, whereby the packing-ring will be pushed up in the neck upon initial outward movement of the closure and thereby prevent accidental displacement thereof.

7. The combination with a jar having an internal marginal flange or shoulder within the neck thereof, of a closure-plug, a flat packing-ring lying between and in frictional engagement with the plug and the neck, with its outer edge underlying the flange or shoulder, whereby the ring will be pushed up upon an initial outward movement of the closure-plug, and thereby prevent accidental displacement thereof, and means to prevent the packing-ring from being pushed into the jar by the insertion of the closure-plug.

702,413. ART OF MAKING BOOKS. ALBERT R. DUNHAM, Brooklyn, N. Y., assignor of one-half to David Williams, New York, N. Y. Filed Apr. 19, 1900. Serial No. 12,412. (No model.)

Claim.—1. A double signature, ready for binding, composed of two different series of pages, one series above the other, with one binding edge extending lengthwise each two series, the ends of the pages of one series abutting the same ends of the pages of the other series.

2. A double signature, ready for binding, composed of two different series of pages, one series above the other, with one binding edge extending lengthwise each two series, each series consecutively numbered, the ends of the pages of one series abutting the same ends of the pages of the other series.

3. A double signature, ready for binding, composed of two uninterrupted, oppositely-running series of consecutive pages, one series above the other, with one binding edge extending lengthwise each two series, the ends of the pages of one series abutting the same ends of the pages of the other series.

4. A double signature, ready for binding, composed of two discontinuous, uninterrupted series of consecutive pages, one series above the other with one binding edge extending lengthwise each two series, the ends of the pages of one series abutting the same ends of the pages of the other series.

5. A double signature, ready for binding, composed of an initial series and a final series of pages, one series above the other with one binding edge extending lengthwise each two series, the ends of the pages of one series abutting the same ends of the pages of the other series.

6. A parallel-fold double signature, ready for binding, composed of two different series of pages, one series above the other with one binding edge extending lengthwise each two series, the ends of the pages of one series abutting the same ends of the pages of the other series.

7. A parallel-fold double signature composed of two uninterrupted oppositely-running series of consecutive pages one end of the pages of one series abutting the same end of the pages of the other series.

8. A parallel-fold double signature comprising two discontinuous uninterrupted series of consecutive pages one end of the pages of one series abutting the same end of the pages of the other series.

9. A double book comprising two united oppositely-disposed duplicate double signatures made up of two consecutive uninterrupted oppositely-running series of consecutive pages one end of the pages of one series abutting the same end of the pages of the other series.

10. A double book comprising two united oppositely-disposed duplicate sets of double signatures, said sets comprising two consecutive uninterrupted oppositely-running series of consecutive pages, one end of the pages of one series abutting the same end of the pages of the other series.

11. A printed sheet having its pages forming a parallel-fold signature composed of different series of consecutively-numbered pages, said series being disposed edge to edge one above another transversely to the binding edge of the signature.

12. A printed sheet having its pages forming a parallel-fold double signature composed of two different series of consecutively-numbered pages disposed one at one side and the other at the other side of the central transverse division-line of the double signature and transversely to the binding edge of said signature.

13. A parallel-fold double signature having three folds therein, the second and third of which are parallel to each other and transverse to the first fold, said signature being composed of two series of consecutively-numbered pages disposed one at one side and the other at the other side of the central transverse division-line of the double signature and transverse to the binding edge of said signature.

14. A parallel-fold double signature composed of two uninterrupted series of consecutive pages having the tops of the pages of one series facing the tops of the pages of the other series.

15. A parallel-fold double signature composed of two uninterrupted oppositely-running series of consecutive pages having the tops of the pages of one series facing the tops of the pages of the other series.

16. A parallel-fold double signature comprising two discontinuous uninterrupted series of consecutive pages having the tops of the pages of one series facing the tops of the pages of the other series.

17. A parallel-fold double signature composed of an initial series and a final series of consecutive pages, the tops of the pages of one series facing the tops of the pages of the other series.

18. A set of parallel-fold double signatures assembled in consecutive order and composed of two different series of consecutively-numbered pages disposed one at one side and the other at the other side of the central transverse division-line of the double signatures and transversely to the binding edges of said double signatures.

19. A set of parallel-fold double signatures assembled in consecutive order and composed of two consecutive series of consecutively-numbered pages disposed one at one side and the other at the other side of the central transverse division-line of the double signatures and transversely to the binding edges of said double signatures.

20. A set of gathered parallel-fold double signatures comprising two consecutive uninterrupted oppositely-running series of consecutive pages having the tops of the pages of one series facing the tops of the pages of the other series.

21. A double book comprising two united oppositely-disposed duplicate double signatures made up of two consecutive uninterrupted oppositely-running series of consecutive pages having the tops of the pages of one series facing the tops of the pages of the other series.

22. A double book comprising two united oppositely-disposed duplicate sets of double signatures, said sets comprising two consecutive uninterrupted oppositely-running series of consecutive pages having the tops of the pages of one series facing the tops of the pages of the other series.

702,414. BOILER-SETTING. EDWARD R. EDGEM, St. Louis, Mo.
Filed Mar. 11, 1902. Serial No. 97,782. (No model.)

Claim.—1. A boiler-setting comprising a fire-box; a bridge-wall extending upwardly behind the fire-box to a point near the boiler, the upper face of said bridge-wall being flat and horizontal; a foundation extending backwardly from the bridge-wall, said foundation being slightly lower at its rear end than the top of the bridge-wall, and said foundation being curved at its rear end to match the curvature of the boiler, the change from the flat top of the bridge-wall to the curve of the rear end being gradual; side walls extending upwardly from the fire-box, bridge-wall and foundation some distance outside of the boiler and above the center thereof; top walls extending inwardly from the upper edges of the side walls to the boiler, the lower faces of said top walls being inclined downwardly at their rear ends; and a rear wall connecting the ends of the side walls, said rear wall having a top wall extending forwardly to the end of the boiler and having a vertical central rib, the spaces on each side of said rib being curved in vertical section to a semicircle and curved in horizontal section to a semicircle, substantially as specified.

2. In a boiler-setting, suitable side walls; top walls; and a rear wall connecting the side walls and having a top wall joining to the boiler, said rear wall having a vertical central rib, the spaces on each side of said rib being curved to a semicircle in vertical section and to a semicircle in horizontal section, substantially as specified.

702,415. MECHANICAL BASE-BALL PITCHER. CHARLES EDWARDS, Brooklyn, N. Y. Filed Jan. 13, 1902. Serial No. 98,464. (No model.)

Claim.—1. A mechanical base-ball pitcher, comprising a base provided with screened sides, a spring provided with a cup to hold the ball and carried by a revolving shaft, means of mechanically collecting and placing the balls in said cup, means of arresting the movement of said spring for a limited time, and means of operating the same.

2. The combination with a mechanical base-ball pitcher, of a screened inclosure to prevent the escape of the ball, a floor inclined from all directions to a predetermined point to guide the ball to such point, an endless belt carrying buckets to elevate the ball, means for operating said belt and delivering the ball to the pitcher.

3. The combination with a mechanical base-ball pitcher, provided with means for recovering the ball, of an open-ended chute having its bottom slotted for some distance from its open end and provided with a pivoted stop projecting at one end through the bottom to engage the ball and at the other end into the slot and with springs projecting from the sides of its open end to clamp the ball between them, and means for tilting the stop and releasing the ball and for pressing apart the springs and delivering the ball to the pitcher.

4. The combination with a mechanical base-ball pitcher provided

with means of recovering the ball and delivering the ball to the pitcher, of shafts carrying sprocket-wheels connected by sprocket-chains provided with buckets interposed between the recovering means and the delivery means and adapted to carry the ball from one to the other, and means for operating one of said shafts.

5. A mechanical base-ball pitcher, comprising two speed standards, a shaft mounted on said standards and provided at one end with a pulley, an arm carried by said shaft and projecting therefrom at right angles to the axis of said shaft, a spring secured at one end to said shaft and normally resting against said arm and provided near its other end with a cup to receive a ball, means for tensioning said spring, and means for driving said shaft.

6. The combination with a mechanical base-ball pitcher provided with a spring carried by a revolving shaft, of two speed standards, and a cross-piece adjustably secured on said standards and adapted to engage said spring and temporarily arrest its movement during the rotation of the shaft.

702,416. CLAMP. JOSEPH FELLOWS, Philadelphia, Pa. Filed Nov. 17, 1900. Serial No. 34,832. (No model.)

Claim.—1. The combination in a clamp, of two sections, each section having internal bearing-points at top and bottom only and a single external bearing-point between the two internal bearing-points, one of the internal bearing-points on one section being adjustable, substantially as and for the purpose specified.

2. The combination in a clamp, of two sections adapted to be inserted in the hole in a barrel, and to encircle a pump, each of said sections having an outer bearing-surface engaging with the barrel, an extended portion engaging the pump, and means for forcing one of said sections out at the top, the lower bearing acting as a fulcrum whereby the clamp

is securely fastened to the barrel and to the pump, substantially as described.

3. The combination in a clamp for securing pumps to barrels, of the two sections adapted to be inserted in a hole in a barrel and encircling a pump, each of said sections having a flange, and a ribbed or roughened portion directly under the flange to engage the barrel and having an extended portion, the lower edge of said extension bearing upon the pump, and means carried by one of said sections for forcing the upper portion of the said section out, thus expanding the clamp and securing the pump to the barrel, substantially as described.

4. The combination of a clamp made in two sections, each section having a flange, a ribbed portion under the flange arranged to engage the barrel, the upper edge of each rib being abrupt and the lower edge inclined, each section having an extension with an internal rib arranged to bear against the pump, and means carried by the upper portion of one of the sections for forcing the upper end of said section away from the pump, and against the barrel whereby the clamp secures the pump to the barrel, substantially as described.

5. The combination of a clamp made in two sections, each section having internal bearing-points at top and bottom and a single external bearing-point between the two internal bearing-points, and a set-screw at one end of the clamp for forcing that end outward, substantially as described.

702,417. VALVE. WILLIAM GATSA, Woodbridge, and LOUIS W. GATSA, Orange, Conn., assignors of two-fifths to John H. Barnes, Norwich, Conn. Filed Apr. 6, 1901. Serial No. 54,828. (No model.)

Claim.—1. In an appliance of the character described, the combination with a valve movable to and fro in a straight line, of a tubular operating-key provided with means for the attachment of a conduit for the delivery of a pressure medium.

2. In an appliance of the character described, the combination with a valve movable to and fro in a straight line, and a tubular operating-key provided with means for the attachment of a conduit for the delivery of a pressure medium, of a discharge-pipe adapted to pass through said tubular key.

3. In an appliance of the character described, the combination with a valve movable to and fro in a straight line, a body portion, a valve-actuator, and a tubular operating-key provided with means for the attachment of a conduit for the delivery of a pressure medium, of a discharge-pipe adapted to pass through said tubular key.

4. An appliance of the character described, having a body portion adapted to be attached to the containing vessel with its exterior surface substantially flush with the exterior surface of the vessel, in combination with a valve-actuator secured to the body portion, and a valve mounted in the casing and movable in a straight line transversely to the axis of the opening through the appliance.

5. In an appliance of the character described, the combination with a body portion adapted to be secured to a vessel, of a valve-actuator secured to the body portion; a valve mounted in the casing to slide to and fro in a straight line; a valve-actuator mounted in the appliance; and a key for operating the valve-actuator.

6. In an appliance of the character described, the combination with a body portion adapted to be secured to a vessel, of a valve-actuator secured to the body portion; a valve mounted in the casing to slide to and fro in a straight line; a valve-actuator mounted in the appliance; and a tubular key separate from and adapted to be engaged with and disengaged from the actuator for operating the valve-actuator.

7. In an appliance of the character described, the combination with a tubular body portion whose bore is adapted to receive an operating-key, of a sliding plate constituting a valve; means for guiding such plate and confining the same to a to-and-fro rectilinear movement; and a valve-actuator separate from the sliding plate and the operating-key, and having projecting pins engaging with the sliding plate and adapted to engage with the operating-key.

8. The combination in an appliance of the character described, of a body portion; a valve-actuator secured to the body portion; a sliding plate constituting a valve movable to and fro in a straight line; an actuator mounted in the valve-actuator and provided with a pin engaging with the sliding plate; and shoulders formed in said valve-actuator for limiting the movement of the actuator.

9. The combination with a body portion, of a valve-actuator secured

thereto; a sliding plate constituting a valve mounted in the valve-actuator to slide to and fro in a straight line; and a valve-actuator provided with a projecting pin engaging with the sliding plate and with projections adapted to engage with an operating-key insertible in the bore of said body portion.

10. In an appliance of the character described, the combination with a tubular body portion whose bore is adapted to receive an operating-key, of a valve; means for guiding the valve and confining the same to a to-and-fro rectilinear movement; a rotatable valve-actuator separate from the valve and having projecting pins engaging with the valve and adapted to engage with the operating-key; and a friction device for preventing the valve from moving too freely.

11. In an appliance of the character described, the combination, of a body portion; a valve-actuator; a sliding plate constituting a valve movable to and fro in a straight line; a rotatable valve-actuator for actuating the sliding plate; a key insertible in the bore of said body portion and adapted to engage with the valve-actuator; and a friction device for preventing the free movement of the actuator.

12. The combination with a sliding plate constituting a valve; an actuator for actuating the sliding plate; an independent guard-piece extending across the passage through the valve when the sliding plate is closed; and means for operating the actuator to open the passage through the valve and shift the guard-piece away from said passage.

13. The combination with a sliding plate constituting a valve; an actuator for actuating the sliding plate; an independent guard-piece consisting of a pivoted finger extending across the passage through the valve when the sliding plate is closed; and means for operating the actuator to open the passage through the valve and shift the guard-piece away from said passage.

14. In an appliance of the character described, the combination with a body portion; a valve-actuator secured to said body portion; a sliding plate constituting a valve mounted in said valve-actuator; a valve-actuator for actuating the sliding plate provided with opposite shoulders; and an independent guard-piece shiftable into and out of position across the opening through the valve by the operation of the shoulders on the valve-actuator.

15. In an appliance of the character described, the combination of a body portion; a valve-plate movable to and fro in a straight line transversely to the axis of the bore extending through the body portion; a key for effecting the movement of the valve-plate; and means for effecting the longitudinal movement of the key when operated to open the valve to form a tight joint with the body portion.

16. In an appliance of the character described, the combination with a valve-actuator, of a valve mounted therein; means for guiding the valve and confining the same to a to-and-fro rectilinear movement; and a rotatable actuator separate from the valve and the operating-key of the device, and having projecting pins engaging with the valve and adapted to engage with the operating-key, whereby motion may be transmitted from the key to the valve.

17. In an appliance of the character described, the combination of a sliding plate constituting a valve; a valve-actuator; an actuator extending through the casing and engaging with said sliding plate; means for preventing the free movement of the sliding plate; a tubular body portion; a tubular key insertible in the bore of said body portion and adapted to engage with the valve-actuator; an independent guard-piece actuated by the operation of said key; means for attaching a conduit to said tubular key for the delivery of a pressure medium; a discharge-pipe adapted to pass through said tubular key; and means for effecting the longitudinal movement of the key to form a tight joint when the key is operated to open the valve.

702,418. GAS GENERATING AND BURNING FURNACE. CHARLES M. GRADIN, Brownwood, Tex., assignor of three-fourths to Charles W. Brown, Adolph Grivot, and Alexander C. Landry, New Orleans, La. Filed June 10, 1901. Serial No. 63,573. (No model.)

Claim.—1. In an oil-gas generating and burning furnace the combination of a fire-box, having a bottom of refractory material and an open recess or chamber extending entirely around the fire-box and opening directly thereto, a perforated air-pipe encircling the fire-box and located back in said recess and provided with perforations opening directly thereto, this piping being of smaller diameter than the outlet of said recess, an air-supply pipe connected to each of the front corners of said pipe and extending out through the front wall of the furnace, a common pipe connecting said two pipes and means for supplying air under pressure to this common pipe, an air-nozzle connected to the front portion of the encircling pipe at a point between the supply-pipes and extending into the furnace, and an oil-supply pipe extending into this air-nozzle, as and for the purpose set forth.

2. In an oil-gas generating and burning furnace, the combination of a fire-box having a bottom of refractory material a recess or chamber formed in its inner wall above said bottom and extending entirely around

the fire-box and opening directly into the same, an air-pipe extending entirely around the fire-box and located back in said recess and provided with numerous perforations opening directly into said recess, this enclosing pipe being of smaller diameter than the outlet of said recess, means for supplying air under pressure to this enclosing pipe, and means for supplying oil to the fire-box.

702,419. PAPER AND CUTTER. GEORGE GIOVANNA, New York, N. Y. Filed June 1, 1901. Serial No. 62,722. (No model.)

Claim.—Is a fruit or vegetable parer and cutter, a body having a flattened-shank formation at one end and a semitubular formation at its opposite end, a corrugated blade secured upon, and extending across the said flattened shank and a straight blade secured upon the said corrugated blade, substantially as described.

702,420. CURTAIN-HANGER. ALFRED F. GOMBERG, Canton, Ohio. Filed July 30, 1901. Serial No. 70,234. (No model.)

Claim.—1. For a curtain-hanger, the combination of a window-frame, a multiplicity of rods directed outward from said frame, there being pin-pointed hooks formed on the outer free ends of said rods, and means for rigidly attaching the inner ends of the rods directly to the window-frame, substantially as specified.

2. For a curtain-hanger, the combination of a window-frame, a multiplicity of rods directed outward from said frame, there being means for attaching a curtain to the outer ends of said rods and bent-down loops formed on the inner ends thereof, a plate located on the outer side of said loops having its upper edge in contact with said rods, there being holes in said plate registering respectively with said loops, and screws passing respectively through said holes and loops into the window-frame, substantially as specified.

3. For a curtain-hanger, the combination of a window-frame, a multiplicity of rods directed outward from said frame, there being means for attaching a curtain to the outer ends of said rods and bent-down loops formed on the inner ends thereof, plates located on the outer and inner sides of said loops, the upper edge of said outer plate being in contact with said rods, there being holes in said plates registering respectively

with said loops, and screws passing respectively through said holes and loops into the window-frame, substantially as specified.

702,431. MEANS FOR DRIVING PRINTING-PRESS. SAMUEL S. GUN, Chicago, Ill., assignor to the Gun Printing Press Company, Chicago, Ill., a Corporation of Illinois. Filed Nov. 23, 1897. Serial No. 591,042. (No model.)

Claim.—1. The combination with a printing-press, of a motor geared directly thereto for driving it, means for disconnecting said motor from said press, and means for transmitting power from said motor for driving other mechanisms than said press.

2. The combination with a printing-press, of a motor geared directly thereto for driving it, auxiliary driving mechanism for said press, means for connecting said auxiliary driving mechanism to said press independently of said motor, means for disconnecting said motor from said press, and means for transmitting power from said motor for driving other mechanisms independently of said press.

702,432. RAD-IRON. HARRY GRANT, Milwaukee, Wis. Filed Dec. 24, 1901. Serial No. 57,694. (No model.)

Claim.—In a rad-iron, the combination of a metallic shell provided with a smoothing-surface, and having its side walls converging forwardly and its front end inclining downwardly toward a common center; a heating-core located in, and conforming in shape to, the interior shape of said shell; a vertically-slidable door having bearings in said shell; a connecting-bar secured to the upper side of said door, provided with an elongated aperture and an operating-handle; a horizontal screw rigidly affixed at one end to one of the handle-supporting standards of said rad-iron, and having its opposite end projecting through the elongated slot of said connecting-bar; a hand-nut operating on said screw, and adapted, as it is turned forward thereon, to force said door against the rear end of said heating-core and said core against the front end of said shell, whereby said core is retained in place and prevented from rattling, all substantially as and for the purpose specified.

702,433. VALVE MECHANISM FOR ENGINE. THOMAS H. HENDERSON, Fort Wayne, Ind. Filed June 12, 1901. Serial No. 64,312. (No model.)

Claim.—1. The combination, with an engine-cylinder, and the piston within the said cylinder, of valve mechanism comprising the following: a valve-rod arranged externally and longitudinally of the chamber of the cylinder; two chambers c' and c'' formed in the valve-rod and arranged longitudinally of the cylinder, with the chamber c' between the chamber c'' and the cylinder; means for exhausting the cylinder; a fluid-pressure-supply part k connected with the chamber c' centrally between the ends of the said chamber; two passage-ways connecting opposite ends of the chamber c' with opposite ends, respectively, of the chamber of the cylinder; two passage-ways connecting together the chambers c' and c'' between the fluid-pressure-supply part and the different exhaust-ports, respectively; a cut-off valve g contained within and movable endwise of the chamber c' and having two piston-heads g' and g'' fitting the surrounding wall of the said chamber c' and arranged a suitable distance apart longitudinally of the valve as to form a fluid-pressure-receiving chamber g' between the said heads, and a main valve f contained within and movable endwise of the chamber c' and having two external annular chambers f' and f'' arranged a suitable distance apart longitudinally of the valve, with the end walls of the said chambers formed by cylindrical piston-heads fitting the surrounding wall of the said chamber c' , all relatively arranged and operating substantially as shown, for the purpose specified.

tained within and movable endwise of the chamber c' and having two external fluid-pressure-receiving chambers f' and f'' arranged a suitable distance apart longitudinally of the valve, all relatively arranged and operating substantially as shown, for the purpose specified.

2. The combination, with an engine-cylinder, and the piston within the said cylinder, of valve mechanism comprising the following: a valve-rod arranged externally and longitudinally of the chamber of the cylinder; two parallel cylindrical chambers c' and c'' formed in the valve-rod and arranged longitudinally of and parallel with the cylinder, with the chamber c' between the chamber c'' and the cylinder; means for exhausting the cylinder; the fluid-pressure-supply part k connected with the chamber c' centrally between the ends of the said chamber; two passage-ways connecting opposite ends of the chamber c' with opposite ends, respectively, of the chamber of the cylinder; two passage-ways connecting together the chambers c' and c'' between the fluid-pressure-supply part and the different exhaust-ports, respectively; a cut-off valve g contained within and movable endwise of the chamber c' and having two piston-heads g' and g'' fitting the surrounding wall of the said chamber c' and arranged a suitable distance apart longitudinally of the valve as to form a fluid-pressure-receiving chamber g' between the said heads, and a main valve f contained within and movable endwise of the chamber c' and having two external annular chambers f' and f'' arranged a suitable distance apart longitudinally of the valve, with the end walls of the said chambers formed by cylindrical piston-heads fitting the surrounding wall of the said chamber c' , all relatively arranged and operating substantially as shown, for the purpose specified.

3. The combination, with an engine-cylinder and the piston within the said cylinder, which cylinder has two parts c' and c'' connected with opposite ends, respectively, of the cylinder, of valve mechanism comprising the following: a valve-rod arranged externally and longitudinally of the chamber of the cylinder; two chambers c' and c'' formed in the valve-rod and arranged longitudinally of the cylinder, with the chamber c' between the chamber c'' and the cylinder; the fluid-pressure-supply part k connected with the chamber c' centrally between the ends of the said chamber; two parts c' and c'' surrounding the chamber c' near opposite ends, respectively, of the said chamber and communicating with the different exhaust-ports, respectively; an annular series of apertures formed in the surrounding wall of the chamber c' and connecting one of the parts c' with the said chamber; another annular series of apertures formed in the said wall and connecting the other part c'' with the said chamber c' ; two passage-ways connecting together the chambers c' and c'' between the fluid-pressure-supply part and the different exhaust-ports, respectively; a cut-off valve g contained within and movable endwise of the chamber c' and having two piston-heads g' and g'' arranged a suitable distance apart longitudinally of the valve as to form the fluid-pressure-receiving chamber g' between them, and a main valve contained within and movable endwise of the chamber c' and comprising two external chambers f' and f'' arranged a suitable distance apart longitudinally of the valve, all relatively arranged and operating substantially as shown, for the purpose specified.

4. The combination, with an engine-cylinder, and the piston within the said cylinder, of valve mechanism comprising the following: a valve-rod arranged externally and longitudinally of the chamber of the cylinder; two chambers c' and c'' formed in the valve-rod and arranged longitudinally of the cylinder, with the chamber c' between the chamber c'' and the cylinder; the fluid-pressure-supply part k connected with the chamber c' centrally between the ends of the said chamber; two passage-ways connecting opposite ends of the chamber c' with opposite ends, respectively, of the chamber of the cylinder; two passage-ways connecting together the chambers c' and c'' between the fluid-pressure-supply part and the different exhaust-ports, respectively; a cut-off valve g contained within and movable endwise of the chamber c' and having two piston-heads g' and g'' arranged a suitable distance apart longitudinally of the valve as to form the fluid-pressure-receiving chamber g' between them, and a main valve contained within and movable endwise of the chamber c' and comprising two external chambers f' and f'' arranged a suitable distance apart longitudinally of the valve, all relatively arranged and operating substantially as shown, for the purpose specified.

5. The combination, with an engine-cylinder, and the piston within the said cylinder, of valve mechanism comprising the following: a valve-rod arranged externally and longitudinally of the chamber of the cylinder; two chambers c' and c'' formed in the valve-rod and arranged longitudinally of the cylinder, with the chamber c' between the chamber c'' and the cylinder; an exhaust-rod h connected with the chamber c' centrally between the ends of the said chamber; the fluid-pressure-supply part k connected with the chamber c' centrally between the ends of the said chamber; two passage-ways connecting opposite ends of the chamber c' with opposite ends, respectively, of the chamber of the cylinder; two passage-ways connecting together the chambers c' and c'' between the fluid-pressure-supply part and the different exhaust-ports, respectively; a cut-off valve contained within and movable endwise of the chamber c' and having two piston-heads g' and g'' arranged a suitable distance apart longitudinally of the valve to form an annular fluid-pressure-receiving chamber g' between the said heads, which valve has a stem g extending through and attached to the central portion of the valve, and a main valve contained within and movable endwise of the chamber c' and comprising two parts or sections f' and f'' arranged in line and a suitable distance apart endwise with each of the said sections f' provided with two piston-heads f' and f'' separated to form a chamber f' between them, which main valve is provided, also, with the following: a bridge or web f connecting the two sections f' and f'' together, passage-ways extending through the said sections f' from the outer ends of the said sections to the exhaust-rod, and a stem f attached to the said web or bridge, all relatively arranged and operating substantially as shown, for the purpose specified.

6. The combination, with an engine-cylinder and the piston within the said cylinder, of valve mechanism comprising the following: a valve-rod arranged externally and longitudinally of the chamber of the cylinder; two parallel chambers c' and c'' formed in the valve-rod and arranged longitudinally of the cylinder, with the chamber c' between the chamber c'' and the cylinder; means for exhausting the cylinder; the fluid-pressure-supply part k connected with the chamber c' between the ends of the said chamber; two passage-ways connecting opposite ends of the chamber c' with opposite ends, respectively, of the chamber of the cylinder; two passage-ways connecting together the chambers c' and c'' between the fluid-pressure-supply part and the different exhaust-ports, respectively; a cut-off valve contained within and movable endwise of the chamber c' and having two piston-heads g' and g'' arranged a suitable distance apart longitudinally of the valve to form a fluid-pressure-receiving chamber g' between them; two vent ports or orifices c' and c'' formed in the surrounding wall of the chamber c' at opposite ends, respectively, of the travel of the cut-off valve, and a main valve contained within and movable endwise of the chamber c' , having two external chambers f' and f'' arranged a suitable distance apart longitudinally of the valve and piston-heads forming the end walls of the said chambers f' , all relatively arranged and operating substantially as shown, for the purpose specified.

702,434. VEHICLE-AXLE ATTACHMENT. JOHN W. HAFER, Baltimore, Pa. Filed Apr. 16, 1902. Serial No. 105,114. (No model.)

Claim.—1. In a vehicle-axle attachment, the combination with a shell having radial recesses, blocks mounted in said shell and provided with pins, a cam-disk rotatably mounted in said shell, a cap-pin mounted in said disk and provided with a curved det formed with a rest, and a head secured to the end of said pin and adapted to engage said rest to lock the cam-disk against movement, substantially as set forth.

2. In a vehicle-axle attachment, the combination with an axle-pin

die provided with an annular groove, of an attachment consisting of a shell having an annular shoulder formed with radial seats or recesses, locking-blocks mounted to slide in said radial seats or recesses and provided with pins, a cam-disk mounted to rotate within said shell and provided upon one face with cam-grooves into which the pins of the blocks project, a pin having a sliding movement in a hole formed in said disk, a spring secured to said disk and connected to said pin and exerting its pressure to move the same inwardly, a cap secured to said disk and formed with a depression and with a curved slot through which said pin projects, said slot being formed with a seat or recess in its walls, and a head secured to the outer end of the pin and adapted to be held seated by the spring in said seat or recess of the cap-plate, substantially as set forth.

702,425. TUMBLER-PRESS. JONATHAN HALEY, AKRON, Ohio.
Filed Feb. 28, 1901. Serial No. 48,516. (No model.)

Claim.—In a machine of the kind designated, the combination with a revoluble mold-bearing table, arranged to be moved with progressive runs, and a vertically-reciprocating plunger to meet one of said molds at each run, and an ejector to force the pressed article from the mold of a horizontally-moving arm arranged to reciprocally swing over and from said table, and having a fork to seize the pressed article and remove it, substantially as shown and described.

702,426. COMBINED FRICTION AND DIRECT-ACTING SPRING DRAFT-RIGGING. JOHN J. HANSEN, MILWAUKEE, Wis. Filed Mar. 24, 1902. Serial No. 98,787. (No model.)

Claim.—1. In a railway draft-rigging, the combination with the draft-timbers or center sills, of side plates fitting between and secured thereto, a draw-bar, a draft-iron in line therewith and fitting between said side plates, a stationary friction-plate in line with the draw-bar and in sliding friction engagement with one of the horizontal sides of the draft-iron, double-incline friction-faces on the opposite side of said draft-iron from said stationary friction-plate, a transversely-movable friction-block having double-incline friction-faces, a transversely-arranged spring acting against said friction-block and centrally pressing said draft-iron against said stationary friction-plate, a direct-acting longitudinally-arranged spring, longitudinally-movable followers bearing against said spring, a guide for said followers, and wings or projections on the draft-iron engaging said followers, said followers partially compressing the longitudinal spring before the transversely-movable friction-block begins to compress the transversely-arranged spring, substantially as specified.

mid stationary friction-plate, a direct-acting longitudinally-arranged spring, longitudinally-movable followers bearing against said spring, a guide for said followers, and wings or projections on the draft-iron engaging said followers, substantially as specified.

2. In a railway draft-rigging, the combination with the draft-timbers or center sills, of side plates fitting between and secured thereto, a draw-bar, a draft-iron in line therewith and fitting between said side plates, a stationary friction-plate in line with the draw-bar and in sliding friction engagement with one of the horizontal sides of the draft-iron, double-incline friction-faces on the opposite side of said draft-iron from said stationary friction-plate, a transversely-movable friction-block having double-incline friction-faces, a transversely-arranged spring acting against said friction-block and centrally pressing said draft-iron against said stationary friction-plate, a direct-acting longitudinally-arranged spring, longitudinally-movable followers bearing against said spring, a guide for said followers, and wings or projections on the draft-iron engaging said followers, said followers partially compressing the longitudinal spring before the transversely-movable friction-block begins to compress the transversely-arranged spring, substantially as specified.

3. In a friction draft-rigging, the combination with a draw-bar and a draft-iron in line therewith, of a stationary friction-plate, double-incline friction-faces on the opposite side of the draft-iron, a transversely-movable block having double-incline friction-faces, a transversely-arranged spring acting against said block and pressing the draft-iron against said stationary friction-plate, a direct-acting longitudinally-arranged spring, followers therefor, and connections for operating the followers, said draft-iron, friction-plate, friction-block and transversely-arranged spring being all directly behind the draw-bar and in the line of draft, substantially as specified.

4. In a friction draft-rigging, the combination with a draw-bar and a draft-iron in line therewith, of a stationary friction-plate, double-incline friction-faces on the opposite side of the draft-iron, a transversely-movable block having double-incline friction-faces, a transversely-arranged spring acting against said block and pressing the draft-iron against said stationary friction-plate, a direct-acting longitudinally-arranged spring, followers therefor, and connections for operating the followers, the transversely-arranged spring and friction-block coming subsequently into action, said draft-iron, friction-plate, friction-block and transversely-arranged spring being all directly behind the draw-bar and in the line of draft, substantially as specified.

5. In a friction draft-rigging, the combination with a draft-iron having double-incline friction-faces and a straight friction-plate, of a stationary friction-plate, a transversely-movable friction-block, a spring acting against said block, a direct-acting longitudinally-arranged spring, followers therefor, a guide for the followers, and wings or projections on the draft-iron to operate the followers, substantially as specified.

6. In a friction draft-rigging, the combination with a draw-bar and draft-iron, of a direct-acting longitudinally-arranged spring above the same, followers therefor, connections for operating the followers, a transversely-

movable friction-block, and a transversely-arranged spring acting against said block, substantially as specified.

7. In a friction draft-rigging, the combination with a draw-bar and draft-iron, of a direct-acting longitudinally-arranged spring above the same, followers therefor, connections for operating the followers, a transversely-movable friction-block, a transversely-arranged spring acting against said block, and a stationary friction-plate against which the transversely-arranged spring presses the draft-iron, substantially as specified.

8. In a friction draft-rigging, the combination with the draw-bar and a draft-iron connected therewith, of side plates, a stationary friction-plate, a transversely-movable friction-block having double inclines, a transversely-arranged spring acting against said block, a longitudinally-arranged spring, followers therefor, a guide for said followers, and projections or wings on the draft-iron for operating the followers, substantially as specified.

9. In a friction draft-rigging, the combination with a frame or side plates, having a longitudinal guide for longitudinally-movable followers, and a transverse guide for a transversely-movable friction-block, of a draft-iron having double inclines for operating the transversely-movable block, projections for operating the longitudinally-movable followers, a transversely-movable block having double inclines, longitudinally-movable followers, a transversely-arranged spring, and a longitudinally-arranged spring, substantially as specified.

10. In a friction draft-rigging, the combination with a frame or side plates, having a longitudinally-extending guide for longitudinally-movable followers, and a transverse guide for a transversely-movable friction-block, of a draft-iron having double inclines for operating the transversely-movable block, projections for operating the longitudinally-movable followers, a transversely-movable block having double inclines, longitudinally-movable followers, a transversely-arranged spring, and a longitudinally-arranged spring, substantially as specified.

702,427. ELECTRIC RAILWAY. JOHN C. HENRY, DENVER, Colo.;
Stuart A. Henry, executor of said John C. Henry, deceased, assignor
to Stanley Electric Manufacturing Company, a Corporation of New
Jersey. Filed Apr. 1, 1901. Serial No. 54,008. (No model.)

Claim.—1. In an electric-railway system where a plurality of cars are controlled simultaneously, controller-magnets on the separate cars, controllers and step-by-step device whereby said controllers are moved a step at a time by said magnets, the said magnets being arranged in series and a manually-operated switch located on one of the cars controlling the circuit of said magnets.

2. In a multiple-unit train-control system, in combination with the main circuit, a train-circuit connected therewith, controllers connected to said train-circuit, local circuits and electromagnetic devices therein arranged to move all of said controllers in unison in either direction, and a switch located in any part of the train arranged to operate said controllers.

3. In a multiple-unit train-control system, in combination with the main circuit, a train-circuit connected therewith, controllers connected to said train-circuit, a local circuit and electromagnetic devices therein arranged to move all of said controllers in unison, the magnets in said local

circuit being arranged in series, and a switch located in any part of the train arranged to operate said controllers.

4. In a multiple-unit train-control system, the combination of a plurality of controller-magnets, local circuits connecting the controller-magnets together, spring circuit-closures at the terminals of the cars, and a portable switch adapted to cooperate with said spring circuit-closures for the purpose set forth.

5. In a multiple-unit train-control system, the combination of a plurality of controller-magnets, a local circuit connecting the controller-magnets together in series, having circuit-closing springs at the terminals of the car, in combination with a portable switch, adapted to engage said springs.

6. In a multiple-unit train system having local circuits in which are included controller-operating magnets, and self-closing circuit-breaking switches at the ends of the cars, a portable key or switch to open said circuit and control it.

7. In a multiple-unit train system, having local circuits in which are included the controller-operating magnets, a switch arranged to control said circuits having an adjustable resistance, arranged to maintain the current practically constant, irrespective of the number of magnets in the circuits, said switch being removable and adapted to connect with contacts in the several local circuits.

8. In a multiple-unit train system, having a plurality of electromagnetically-operated controllers and local circuits independent of the motor-circuits and including the controller-operating magnets, a switch arranged to control said circuits having an adjustable resistance, arranged to maintain the current practically constant, irrespective of the number of magnets in the circuits.

9. In combination with a controller adapted to vary the speed of motors and comprising two electromagnets and step-by-step device operated thereby to move the controller in opposite directions, a reversing-switch connecting said controller and arranged to be automatically operated by said controller when the latter is in off position, substantially as set forth.

10. In combination with a rotary controller, a rotary switch adapted to reverse the direction of the motor, controlled thereby, each reversing-switch being connected to the controller only when the latter is in off position, and being arranged to move only by the backward movement of said controller, substantially as described.

702,428. WHEELBARROW. CHARLES REWITT, PHILADELPHIA, Pa.
Filed Mar. 11, 1902. Serial No. 97,002. (No model.)

Claim.—In a metal wheelbarrow, an axle and wheels, standards secured to said axle and arranged in vertical alignment therewith, a box pivotedly secured to the upper ends of said standards and having its point of support beyond its central vertical axle, handles secured to said axle, a cross-bar connected with and arranged above said handles and below the pivotal point of said box and adapted to support the same at one end thereof, a spring arm or catch secured to said cross-bar and adapted to engage said box at its upper edge and to lock the same to said cross-bar, frames secured to said handles and axle and supporting said handles and box in substantially horizontal position, and brace-bars connecting said standards and frames and adapted to maintain said standards in vertical position.

702,429. WRINGER-MACHINE. SPENCER S. HIGGINS, HOSEA,
Ill. Filed Jan. 20, 1902. Serial No. 95,427. (No model.)

Claim.—In a wringing-machine, the combination of a supporting-frame, a side-bar in rotating engagement therewith, a wringer-frame pivoted to one end of the supporting-frame, a recess B^1 in one of the side bars of the wringer-frame, a latch having an inwardly-projecting end portion, the latch being pivoted to the side bar adjacent to the recess therein, a blank B^2 attached to the side-bar so that one end will enter the recess and the other end will be engaged by the projecting end portion of the latch, substantially as shown and for the purpose set forth.

702,429.

702,430. INTERNAL-COMBUSTION ENGINE. JAMES F. HOBART, Brooklyn, N. Y., assignor to Clarence F. Wyckoff, Ithaca, N. Y., and James R. Chisholm, Borough of Manhattan, New York, N. Y. Filed Mar. 30, 1901. Serial No. 53,007. (No model.)

Claim.—1. An internal-combustion engine, comprising two pistons, connections between the said pistons whereby one moves faster than the other, a combustion-chamber for one piston acting therewith upon the four-cycle principle and a second combustion-chamber for the other piston acting therewith upon the two-cycle principle, substantially as described.

2. An internal-combustion engine comprising a cylinder, two pistons therein and two combustion-chambers, one piston and combustion-chamber having a two-cycle action and the other piston and its combustion-chamber having a four-cycle action, substantially as described.

3. An internal-combustion engine comprising a cylinder, two pistons therein and two combustion-chambers, one piston and combustion-chamber having a two-cycle action and the other piston and its combustion-chamber having a four-cycle action, one of the combustion-chambers being common to both pistons, substantially as described.

4. An internal-combustion engine comprising a cylinder, two pistons and two combustion-chambers therein, one of said pistons having a two-cycle action and with a combustion-chamber on each side of the same, whereby said piston receives an impulse in each direction and the other piston having a four-cycle action and receiving an impulse in one direction, substantially as described.

5. An internal-combustion engine comprising a cylinder, two pistons therein, a combustion-chamber between the pistons, a second combustion-chamber for one of the pistons, the latter piston acting on the two-cycle principle and receiving an impulse in each direction and the other piston acting on the four-cycle principle and receiving its impulse from the intermediate combustion-chamber, substantially as described.

6. In combination in an internal-combustion engine, a cylinder, two pistons and two combustion-chambers therein, one piston with its combustion-chamber having a two-cycle action and the other with its combustion-chamber having a four-cycle action, the piston-rod of one piston extending through that of the other and the two to one gear between the piston-rods, substantially as described.

7. In combination in an internal-combustion engine, a single cylinder, two independent power-pistons and two combustion-chambers in the cylinder, and an air-compression chamber in said cylinder, substantially as described.

8. In combination in an internal-combustion engine, two pistons with their combustion-chambers, an air-compression chamber and a connection between the combustion-chamber of one piston and the air-compression chamber whereby the said combustion-chamber will receive compressed air therefrom, substantially as described.

9. In combination in an internal-combustion engine, a two-cycle piston with its combustion-chamber, a four-cycle piston with its combustion-chamber and an air-compression chamber in which air is compressed by one of the pistons, substantially as described.

10. In combination in an internal-combustion engine, a cylinder, two pistons therein, a combustion-chamber intermediate the pistons, a combustion-chamber at one end of the cylinder and an air-compression chamber at the other end of the cylinder, substantially as described.

11. In combination in an internal-combustion engine, the two pis-

tons moving at different speeds, a combustion-chamber for each piston, an air-compression chamber, a connection between the air-compression chamber and one of the combustion-chambers leading through said piston, and a connection leading from the air-compression chamber to a point outside the engine substantially as described.

12. In combination in an internal-combustion engine, a cylinder, a piston, a combustion-chamber, an air-compressor chamber in the cylinder, a storage-reservoir, and means whereby the compressed air is controlled to pass to the storage-reservoir at times directly from the air-compressor chamber and at other times to the combustion-chamber, substantially as described.

13. In combination in an internal-combustion engine, two pistons, two combustion-chambers, an air-reservoir, a compressed-air chamber and means whereby the compressed air is at times sent to the air-reservoir or again expanded in the compressed-air chamber and at other times to one of the combustion-chambers, substantially as described.

14. In combination in an internal-combustion engine, a cylinder, a piston and a combustion-chamber therein having a two-cycle action, a second piston and a combustion-chamber therein having a four-cycle action, an air-reservoir, an air-compression chamber in the cylinder and means whereby the compressed air is caused to pass alternately to the air-reservoir or to expand again in the compression-chamber and to one of the combustion-chambers, substantially as described.

15. In combination in an internal-combustion engine, a cylinder, a piston and a combustion-chamber therein having a two-cycle action, a second piston and a combustion-chamber therein having a four-cycle action, the hollow piston-rods having openings to allow at certain times, an air-compression chamber to communicate with the hollow piston-rod through the said openings, said hollow piston-rod communicating with one of the combustion-chambers, substantially as described.

16. An explosion-engine comprising two cylinders, a pair of pistons in each, one piston having a two-cycle action and the other having a four-cycle action, the said pistons being all connected together, substantially as described.

17. In combination, a cylinder, the two pistons therein with their combustion-chambers, one of said pistons having a four-cycle action derived from the combustion-chamber on one side and having alternately on its other side an air-compressing action and an air-transferring action, said transfer of air taking place to the combustion-chamber of the other piston, substantially as described.

702,431. FOLDABLE TRUSS. HARRY E. HOWARD, Chicago, Ill. Filed Jan. 24, 1902. Serial No. 91,008. (No model.)

Claim.—1. A truss composed of four legs pivoted together in pairs, one pair adapted to fold between the other pair, the oppositely-placed legs of each pair connected at their upper ends by bolts, the bolt connecting the outer pair being longer than the thickness of said legs whereby they may freely move longitudinally on said bolt when the legs are folded and unfolded, a right strap connecting the outer pair of legs above their pivotal point, a top bar pivoted on the bolt connecting the upper ends of the outer legs and slidably mounted on the bolt connecting the upper ends of the inner legs, and a spreader for the outer legs, all substantially as set forth.

2. In a truss of the character described having two pairs of legs pivoted together, a top bar pivoted between one pair of legs, and an outwardly and downwardly extending catch secured to the under side of the top bar near its free end, said catch adapted to positively engage the bolt connecting the ends of the other pair of legs and to hold the top bar against upward movement, substantially as set forth.

702,432. VEHICLE-TIRE. WILLIAM R. HUFFMAN, Boston, Mass. Filed Nov. 20, 1900. Serial No. 31,008. (No model.)

Claim.—1. A vehicle-tire comprising a base or inner portion of hard rubber and a tread or outer portion of soft rubber, said portions being

permanently united to form a unitary structure, and retaining devices located wholly within the hard-rubber base portion and consisting of retaining-wires located in longitudinal apertures in said base portion, the soft-rubber portion of the tire having no retaining devices located therein, substantially as described.

2. A vehicle-tire, comprising a hard-rubber base and a soft-rubber tread, the base being provided with a longitudinal aperture or apertures to receive a retaining wire or wires and having a corresponding rib or ribs on its outer surface, substantially as described.

3. A vehicle-tire, comprising a relatively thin base of hard rubber provided with longitudinal apertures and with corresponding ribs on its outer surface, and a relatively thick tread portion of soft rubber having its inner surface adapted to fit the outer surface of the base and permanently united thereto, substantially as described.

4. A vehicle-tire provided with a soft-rubber tread and a hard-rubber base, said base having transverse grooves or recesses in its under side, in combination with a channelled rim to receive said tire, a plurality of bars located at intervals transversely of the rim and adapted to fit the recesses of the tire-base, each bar being provided with a shank or projection engaging the rim and having its ends abutting against the flanges of the rim to prevent displacement of the bar, and suitable retaining-wires extending through the tire, substantially as described.

5. The combination with a tire having a soft-rubber tread and a hard-rubber base provided at intervals with transverse recesses, of a wheel having a flange and a channelled rim apertured at suitable intervals, a plurality of cross-bars adapted to fit transversely in the channel and to engage the recesses of the tire-base, each cross-bar being provided with a shank adapted to extend through the corresponding apertures of the rim and flange and threaded at its outer end, and nuts fitting the projecting threaded ends of said shanks and suitable retaining-wires under tension extending through the tire outside of the rim, substantially as described.

6. The combination with a tire having a soft-rubber tread and a hard-rubber base provided at intervals with transverse recesses, of a wheel having a flange and a channelled rim apertured at suitable intervals, a plurality of cross-bars adapted to fit transversely in the channel and to engage the recesses of the tire-base, each cross-bar being provided with a shank adapted to extend through the corresponding apertures of the rim and flange and threaded at its outer end, and nuts fitting the projecting threaded ends of said shanks and suitable retaining-wires under tension extending through the tire outside of the rim, substantially as described.

7. The combination with a flange and a channelled metallic rim, of a transverse bar fitting therein and removably connected therewith, said cross-bar being provided with apertures, a longitudinally-apertured elastic tire fitting said rim, and retaining-wires extending through said apertures, one end of each wire being secured in the corresponding aperture of the cross-bar by riveting or otherwise and the other end of each wire extending through a suitable passage in the rim and flange to the interior of the latter, and threaded at its projecting end, and nuts mounted on said threaded ends, substantially as described.

8. A vehicle-wheel, comprising a flange and a channelled metallic rim provided with a cross-bar fitting and detachably connected therewith, said cross-bar being provided with apertures to receive the inner ends of the retaining-wires, an elastic tire fitting said channelled rim and provided with longitudinal apertures, and retaining-wires extending through said apertures, having their inner ends secured in the apertures of the cross-bar and their outer ends extending through passages in the rim and flange and threaded, and nuts mounted on said threaded portions, the flange being provided with shoulder recesses to receive said nuts, substantially as described.

9. In a tire of the character described, the combination with a metallic channelled rim and a longitudinally-apertured elastic tire fitting therein, of retaining-wires, and a cross-bar fitting within the channelled rim

and detachably connected therewith, the inner ends of the retaining-wires being secured to said cross-bar and said cross-bar being provided with inclined seats for the other ends of said wires, which extend over said cross-bar to the inner edge of the wheel, substantially as described.

702,433. FINGER-BAR-ADJUSTING DEVICE FOR MOWING-MACHINES. CHARLES C. HUNTER, LAWRENCE, Ind. Filed Feb. 15, 1900. Serial No. 5,304. (No model.)

Claim.—1. The combination, in a mowing-machine, of the finger-bar, the shoe, the frame to which it is attached, two attaching-joints one on each side of said finger-bar, one of said attaching-joints being mounted to be adjusted longitudinally in relation to the finger-bar, whereby said finger-bar may be aligned with the direction of the motion of the outer-bar, substantially as set forth.

2. The combination, in a mowing-machine, of the finger-bar, the shoe, the frame to which the same is attached, bearings on said shoe forming a part of the means of attachment, one of said bearings being slotted and attached to said shoe by means of bolts passing through said slots, a screw-rod projecting from said means of attachment and passing through a suitable eye on said shoe, and a nut on said screw-rod whereby an adjustment of the finger-bar relative to the parts to which it is attached may be secured, substantially as shown and described.

702,434. GAS-RANGE. WILLIAM D. EYMON, Toronto, Canada. Filed Apr. 11, 1901. Serial No. 53,414. (No model.)

Claim.—A gas-stove comprising a casing, two vertical flues dividing the casing into three compartments, each of said compartments being an oven, two outwardly-hinged doors for the two outer ovens, a drop-hinged door for the central oven, and a plate-warming compartment located below the central oven and between the lower ends of the vertical flues.

702,435. STRENGTH-TESTER. GEORGE JAMES and HERBERT HENRIKSEN, Chicago, Ill. Filed Dec. 24, 1900. Serial No. 62,526. (No model.)

Claim.—1. In a coin-controlled strength-testing mechanism, in combination, two pivoted hand-levers; a connection between said levers; a tension-spring for each of said levers; a pivoted shutter for one of said levers; a stop projection on said shutter; a detent for engaging said stop projection; and a coin-controlled mechanism for withdrawing the detent.

2. In a coin-controlled strength-testing mechanism, in combination, two pivoted hand-levers; a connection between said levers; a tension-spring and a shutter for each of said levers; a stop projection on each of said shutters; a detent-lever having a tooth for engaging each of said stop projections; and a coin-controlled mechanism for withdrawing the detent.

3. In a coin-controlled strength-testing mechanism, in combination, two pivoted hand-levers; a tension-spring for each of said levers; means for connecting the movement of said levers; and a coin-controlled mechanism for releasing the levers to action.

4. In a coin-controlled strength-testing mechanism, in combination, two pivoted hand-levers; a connection between said levers; a tension-spring and a shutter for each of said levers; a stop projection for each of

said shutters; a detent-lever having a tooth for engaging each of said stop projections; a coin-pocket fixed with relation to said detent-lever; a stop-pin in said pocket; and means adapted to engage the coin and move said coin-pocket and said detent-lever.

5. In a coin-controlled strength-testing mechanism, in combination, two pivoted hand-levers; a connection between said levers; a tension-spring and a shutter for each of said levers; a stop projection for each of said shutters; a fixed cam for one of said shutters; a detent-lever having a tooth for engaging each of said stop projections; a coin-pocket fixed with relation to said detent-lever; a stop-pin in said pocket; a lever pivoted with relation to said coin-pocket; and a coin-engaging pin on said lever.

6. In a coin-controlled strength-testing mechanism, in combination, a face-plate having two elongated openings therein; two hand-levers extending through said openings, pivotally mounted with relation to said face-plate; a connection between said levers; a bell-crank on each of said levers; two tension-springs fixed with relation to said face-plate and having connection with said bell-crank levers; a shutter for each of said levers; a stop projection for each of said shutters; a fixed cam for one of said shutters; a pivoted detent-lever having a tooth for engaging each of said stop projections; a coin-pocket fixed with relation to said detent-lever; a stop-pin fixed with relation to the face-plate, extending into said coin-pocket; a lever pivoted with relation to said coin-pocket, which lever is adapted to be engaged by the fixed cam on one of said shutters; and a coin-engaging pin on said lever.

7. In a coin-controlled strength-testing mechanism, in combination, a pivoted hand-lever; a tension-spring; means for preventing the operation of the hand-lever; a coin-controlled mechanism for releasing the hand-lever to action; an indicator-dial; a longitudinally-slidable shaft; a dial-hand fixed to said shaft; a sleeve rigidly mounted on said shaft; a cord extending over said sleeve and connected with said hand-lever; a coil tension-spring surrounding said shaft, adapted to restore said sleeve to its normal position after said sleeve has been rotated by the movement of the hand-lever; a friction-surface adjacent to said sleeve; a spring for sliding said shaft to move said sleeve into frictional engagement with said friction-surface; and a lever and a thumb-latch for releasing said sleeve from its engagement with said surface.

702,486. SAND PUMP AND RAILER. WILLIAM E. JOHNSON, Conneaut, Pa. Filed July 9, 1901. Serial No. 67,572. (No model.)

Claim.—1. In a sand pump and railer, the combination of a cylinder having bayonet-shut at the lower end thereof and a locking-dot, a removable section having an upper reduced end with studs to fit in said lower cylinder end and also provided with a locking-dot to coincide with

that of the cylinder end, the upper portion of the section also being formed with a slot below the locking-dot, a spring-arm on the inner side of the section and extending over the lower slot and having an upper outwardly-projecting head to engage the said locking-dot, and a releasing-lever fulcrumed in the lower slot of the section to engage the spring-arm to release the head thereof from the said locking-dot, the parts all being flush with the exterior of the cylinder and section.

2. The combination of a stationary and a removable member, each of said members having slots therein adapted to register one with the other, the removable member having a slot disposed below said registering slot, a spring-arm fastened to the inner face of said removable member below the second slot and adapted to extend thereover, said arm having a head adapted to project through the registering slots in the two members and lock them together, and a lever fulcrumed in said slot and adapted to engage said arm.

3. The combination of a cylinder having an aperture near the lower end thereof, a removable section having an upper reduced end to fit in said cylinder and provided with an aperture adapted to register with the aperture in the cylinder, said section also having a slot disposed therein below said aperture, a spring-arm attached to the lower face of said section below said slot and extending thereover, said arm having a head adapted to project through the registering apertures in the cylinder and removable section and lock said parts together, and a lever fulcrumed in said slot and adapted to engage said arm.

702,487. ELECTRIC CIGAR-LIGHTER. WILLIAM F. KIMBLE, Auburn, Ind. Filed Oct. 27, 1900. Serial No. 24,567. (No model.)

Claim.—1. In an electric cigar-lighter, a tubular supporting-stand and provided upon its front face with an insulated bracket for the spark-lever, and with a fixed snuffing-cup; a vertically-arranged wick-tube pivotally suspended from said stand, having its upper end in co-operative relation with said snuffing-cup, and provided upon its lower end with a detachable tubular extension; an oil-receptacle removably mounted on the lower end of the wick-tube; a striking-plate fixed on the upper end of the wick-tube to prevent mutilation thereof by the spark-lever; a pivoted spark-lever in co-operative relation with the said striking-plate; and a wind-shield having a central notched tongue by which it is detachably mounted on said wick-tube as described.

2. The combination in an electric cigar-lighter of a tubular stand, having a fixed snuffing-cup and a pendant pivoted spark-lever; a vertical wick-tube pivotally suspended from the said stand, having an offset at its lower portion for the purpose specified; and provided with a

detachable pendant tubular extension; a striking-plate on the upper end of said wick-tube to prevent mutilation of said tube in co-operative relation with the said spark-lever; and a wind-shield detachably mounted on the said wick-tube as shown by means of a centrally-arranged tongue or lug.

3. In an electric cigar-lighter, the combination of a tubular stand, having a fixed snuffing-cup and a pendant pivoted spark-lever; a vertical wick-tube pivotally suspended from the said stand, having an offset at its lower portion for the purpose specified, and provided with a detachable pendant tubular extension; and a striking-plate on the upper end of said wick-tube to prevent mutilation of said tube, in co-operative relation with the said spark-lever.

702,488. CIGAR-LIGHTER. WILLIAM F. KIMBLE, Auburn, Ind. Filed June 28, 1901. Serial No. 66,577. (No model.)

Claim.—1. A cigar-lighter consisting of a pivoted hanger-bracket; a sleeve pivotally suspended in said bracket; a wick-tube suspended in said sleeve and adapted for a limited vertical movement therein; a bellows handle removably mounted on the lower end of said wick-tube; a ventilated flame-shield mounted on the upper end of the said sleeve and adapted to normally maintain the flame in the interior thereof.

2. In a cigar-lighter a pivoted hanger-bracket; a supporting-sleeve pivotally suspended from said bracket; a wick-tube movably mounted in said sleeve; an oil-receptacle handle removably mounted on the lower end of said wick-tube; a flame-shield mounted on the upper end of said sleeve provided upon its upper end with a ventilated air-chamber within which a small flame is normally maintained.

3. In a cigar-lighter the combination of a wick-tube; an insulating pivotally-suspended sleeve slightly connected with the said wick-tube; a flame-shield mounted on the upper end of the said sleeve having an open-topped and ventilated chamber adapted to normally maintain a low flame therein and means for operating the said slidable sleeve.

4. In a pivoted cigar-lighter a pivotally-suspended sleeve; a wick-tube slidably mounted within said sleeve; means for so connecting the said sleeve and wick-tube that the wick-tube will be automatically elevated within said sleeve by the act of raising the lighter to the normal position for lighting a cigar, and will resume its normal position in said sleeve by gravity; and a flame-shield mounted on said sleeve within which a small flame is normally maintained.

702,489. TAP-REEL. WILLIAM KIMBLE, Hoboken, N. J., assignor to the Krouff & Bess Company, a Corporation of New Jersey. Filed Jan. 8, 1901. Serial No. 62,665. (No model.)

Claim.—In a tap-reel, the combination with a tap-case, and a tap-drum having registering openings through its opposite plates near one edge thereof, of a crank of a length equal to the width of the drum blinged externally to one drum-plate at the edge thereof diametrically opposite to the openings in the plate, and a knuckle-jointed handle projecting from

the outer end of the crank, when extended, and passing through the openings in both of the tap-drum plates, and projecting in and slightly beyond the opposite plate when closed, substantially as, and for the purpose set forth.

702,440. GRAIN-SPOUT. BERNARD KIMBLE, Hoboken, Minn. Filed July 31, 1901. Serial No. 70,301. (No model.)

Claim.—In a grain-spout having an opening formed through the lower side thereof, a wire-mesh screen adapted to be secured within said opening, a trough-shaped secondary spout arranged below said screen, guideways secured to each edge of the secondary spout, bolts adapted to slide within said guideways, levers secured to the spout proper, into which the ends of the bolts are adapted to be shot to secure the secondary spout to the spout proper, a gate-valve arranged within the spout near the receiving end, means for raising and lowering said valve, a pivoted cover pivoted to the side of the spout and adapted to open or close the discharge end of the same, latches adapted to secure said cover in either its raised or lowered position, substantially as and for the purpose set forth.

702,441. CENTRIFUGAL SEPARATOR. PERLEY L. KIMBALL, Hoboken, N. J. Filed Sept. 12, 1900. Serial No. 29,323. (No model.)

Claim.—1. In combination, the separator-body, the separator-cover secured to the top of the body, and the partition smaller in diameter than the interior diameter of the body; said partition being separable from both the body and the cover and supported at feet vertically and laterally by the floor of the separator-body and raised a short distance above the same, and at top laterally by the separator-cover, all substantially as described and for the purposes set forth.

2. In combination, the separator-body, the separator-cover secured to the top of the body, and the partition, open at one end, smaller in diameter than the interior diameter of the body; said partition being separable from both the body and the cover and supported at feet vertically and laterally by the floor of the separator-body and raised a short distance above the same, and at top laterally by the separator-cover, and openings formed through the bottom of said partition, all substantially as described and for the purposes set forth.

3. In combination, the separator-body; the separator-cover; and the longitudinally-arranged, open-top partition separable from both body and cover and provided with sets of flow-passage at different distances from the center of rotation and supported at feet vertically and laterally by a plate entering the floor of the separator-body and at the top laterally by the separator-cover; all substantially as described and for the purposes set forth.

4. In combination, the separator-body; the separator-cover; the

JUNE 17, 1902.

partition separable from both body and cover and supported at foot vertically and laterally by the floor of the separator-body and at top laterally by the separator-cover; and the open-bottom partition supported laterally and vertically at foot by the first-named partition and at top laterally by the separator-cover, all substantially as described and for the purposes set forth.

5. In combination; the separator-body; the separator-cover; the partition separable from both body and cover and supported at foot vertically and laterally by the floor of the separator-body and at top laterally by the separator-cover; and the open-bottom partition, separable from both body and cover, and supported laterally and vertically at foot by the first-named partition and at top laterally by the separator-cover; all substantially as described and for the purposes set forth.

6. In combination; the separator-body; the separator-cover; the corrugated, open-top partition separable from both body and cover provided with sets of flow-passages at different distances from the center of rotation and supported at the foot laterally and vertically by a pin entering the floor of the separator-body and at the top laterally by the separator-cover; and the corrugated open-bottom partition separable from both body and cover, provided with sets of flow-passages at different distances from the center of rotation, and supported at the foot laterally and vertically by the floor of the said first-mentioned partition and at the top by the separator-cover, all substantially as described and for the purposes set forth.

7. In combination; the separator-body; the separator-cover provided with the stop-pin-socket; the two partitions both separable from body and cover and both supported laterally at top by the cover; and the stop-pin attached to one of the partitions and intermeshing with the other partition; all substantially as described and for the purposes set forth.

8. In a separator the corrugated partition and reinforcing-rings therefor passing through the inner apices of the corrugations.

9. In a separator the corrugated partition and reinforcing-rings therefor located in notches formed in the outer apices.

10. The combination in a separator with the body, the removable partitions located one within the other in said body, of the reinforcing-rings secured to the inside of the inner partition and to the outside of the outer partition.

11. The combination in a separator with the body and the longitudinally-corrugated partitions located one within the other in said body, of reinforcing-rings for the inner partitions passing through the inner apices of the corrugations and reinforcing-rings for the outer partition located in notches formed in the outer apices.

702,442. GEARING FOR MOWING-MACHINES. WILLIAM A. KIRBY, Newbury, N. Y. Filed Jan. 31, 1902. Serial No. 98,051. (No model.)

Claim.—In gearing for mowing-machines, the combination with the main shaft, and the carrying-wheels for driving said shaft, of a bevel-gear loose on the shaft and having a pawl-and-ratchet engagement with one driving-wheel, a second bevel-gear fast on the shaft opposite the first bevel-gear, one or more bevel-pinions interposed between the bevel-gears, a train of gears one of which carries the bevel pinion or pinions, and pawl-and-ratchet devices interposed between the shaft and the other driving-wheel, substantially as set forth.

702,448. SURGICAL INSTRUMENT. LOUIS R. KRATZMUELLER, Chicago, Ill. Filed May 15, 1901. Serial No. 90,346. (No model.)

Claim.—1. A surgical instrument comprising a pair of jaws pivoted together and each having a shank, one of the shanks having a laterally-extending part lying in the plane of its pivotal movement with said shank, and the other shank having a pair of members which have a resilient action toward each other and against opposite sides of said laterally-extending part, said members being adapted to control the relative pivotal position of said jaws through frictional contact with the sides of said laterally-extending part.

2. A surgical instrument comprising a pair of jaws pivoted together and each having a shank, one of the shanks having a laterally-extending part lying in the plane of its pivotal movement with said shank, and having a trigger extending oppositely to said laterally-extending part, and the other shank having a pair of members which have a resilient action toward each other and against opposite sides of said laterally-extending part, said members being adapted to control the relative pivotal position of said jaws through frictional contact with the sides of said laterally-extending part.

3. A surgical instrument comprising a pair of jaws pivoted together and each having a shank, one of the shanks having a laterally-extending part lying in the plane of the pivotal movement of each shank, and the other shank being formed of resilient material bent upon itself and around said laterally-extending part in suitable manner to bear against each side of same and through frictional contact with opposite sides of said laterally-extending part, to control the relative pivotal positions of said jaws.

4. A surgical instrument comprising a pair of jaws pivoted together and each having a shank, one of said shanks being bent upon itself to form a laterally-extending bight and thence continuing to form a trigger extending oppositely to said bight, and the second shank bearing against the side of and extending rearward of said bight, being thence bent upon itself to form a handle, thence returning across and bearing against the opposite side of said bight and having its free end hooked over the opposite part of said second shank forward of said bight.

5. A surgical instrument comprising a pair of jaws pivoted together and each having a shank, one of the shanks having a laterally-extending part lying in the plane of the pivotal movement of each shank, and the other shank having a member bearing against each side of said laterally-extending part and through frictional contact therewith controlling the relative pivotal positions of said jaws; the pivotal connection of the jaws consisting of a pin rigid on one jaw and having an unthreaded end projecting loosely into a recess in the other jaw and adapted for freely disconnecting the jaws in the manner specified when said laterally-extending part is withdrawn free from the members bearing against its sides.

702,444. SHOW-CASE OR SHOW-FRONT. CHARLES F. KERR, Cleveland, Ohio. Filed May 10, 1901. Serial No. 89,686. (No model.)

Claim.—1. In a show-case or show-front, the combination, with two glass plates arranged at an angle to each other with one of the said plates overlapping an edge of the other plate, of a fastening device instrumental in holding the said plates together and comprising a metal strap attached at opposite ends to the different plates, respectively, with the central portion of the straps of spring metal and bowed laterally, substantially as and for the purpose set forth.

2. In a show-case or show-front, the combination, with an upright glass plate and a top plate resting upon and overlapping the upper edge of the said upright plate, of fastening devices for attaching the said top plate to the said upright plate, which fastening devices comprise, respectively, a metallic strap attached at opposite ends to the inner side of the different plates, respectively, and having its central portion of spring metal bowed inwardly to form a spring, and the top-plate-connected end of the strap being separated a short distance from the upright plate, substantially as and for the purpose set forth.

3. In a show-case or show-front, the combination, with an upright plate and a top plate overlapping and resting upon the said upright plate, of a spring-metal strap arranged at the inner sides of the said plates at the corner formed between the plates, which strap has its upper end extending along the under side of the top plate and provided with a screw-threaded hole so as to form a nut and has its opposite end extending along the inner side of the upright plate and provided with a hole extending therethrough so as to form an ear, which strap is bowed inwardly between its ends so as to form a spring, a screw extending through the top plate and engaging the hole in the nut-forming member of the strap and having a head arranged at the upper or outer side of the top plate, another screw extending through the upright plate and through the hole in the ear-forming member of the strap and having a head arranged at the outer side of the said upright plate, and a nut mounted upon the last-mentioned screw at the inner side of the strap.

702,445. PROCESS OF MAKING MORDANT COLORS. MARTIN LANGE and TADEUSZ BULLEWIK, Amsterdam, Netherlands. Filed Dec. 11, 1900. Serial No. 33,473. (Specimens.)

Claim.—The herein-described process of making a yellow-mordant color, by condensing 1,8 dioxynaphthalene with a substance containing the carboxylic-acid molecule; whereby said carboxylic-acid radical is bound to the nucleus of the 1,8 dioxynaphthalene, substantially as described.

702,446. VOTING-MACHINE. JOHN E. MARARA and WILLIAM F. REY, Elmhurst, Wash. Filed July 22, 1901. Serial No. 62,302. (No model.)

Claim.—1. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, each intermediately interrupted to form two parts, keys mounted on both parts, and an oscillating crank for each shaft, the said crank being capable of engaging with either or both shaft parts, substantially as set forth.

2. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts, a register carried by each key, means for oscillating said shafts and depressing the keys thereon, and connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, substantially as set forth.

3. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts, a register carried by each key, cranks for oscillating said shafts and depressing the keys thereon, and connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, substantially as set forth.

4. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts, a register carried by each key, means for oscillating said shafts and depressing the keys thereon, and pawl-and-ratchet connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, substantially as set forth.

5. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts, a register carried by each key, cranks for oscillating said shafts and depressing the keys thereon, and pawl-and-ratchet connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, substantially as set forth.

6. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts in lines at right angles to the shafts, means for oscillating said shafts and depressing the keys thereon, connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, and connections actuated by the depression of a key to disengage the oscillating connection from all the remaining keys in the same line, substantially as set forth.

7. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts in lines at right angles to the shafts, cranks for oscillating said shafts and depressing the keys thereon, connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, and connections actuated by the depression of a key to disengage the oscillating connection from all the remaining keys in the same line, substantially as set forth.

8. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts in lines at right angles to the shafts, means for oscillating said shafts and depressing the keys thereon, pawl-and-ratchet connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, and connections actuated by the depression of a key to disengage the oscillating connection from all the remaining keys in the same line, substantially as set forth.

9. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts in lines at right angles to the shafts, cranks for oscillating said shafts and depressing the keys thereon, pawl-and-ratchet connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, and connections actuated by the depression of a key to disengage the oscillating connection from all the remaining keys in the same line, substantially as set forth.

10. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts in lines at right angles to the shafts, a register carried by each key, means for oscillating said shafts and depressing the keys thereon, connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, and connections actuated by the depression of a key to disengage the oscillating connection from all the remaining keys in the same line, substantially as set forth.

11. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts in lines at right angles to the shafts, a register carried by each key, cranks for oscillating said shafts and depressing the keys thereon, connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, and connections actuated by the depression of a key to disengage the oscillating connection from all the remaining keys in the same line, substantially as set forth.

12. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts in lines at right angles to the shafts, a register carried by each key, means for oscillating said shafts and depressing the keys thereon, pawl-and-ratchet connections between said keys and shafts to allow of a key being depressed without oscillating its supporting-shaft, and connections actuated by the depression of a key to disengage the oscillating connection from all the remaining keys in the same line, substantially as set forth.

13. As an improvement in automatic voting-machines, the combination of the following elements: a base, a plurality of shafts thereon, keys fulcrumed on said shafts in lines at right angles to the shafts, a register carried by each key, cranks for oscillating said shafts and depressing the keys thereon, pawl-and-ratchet connections between said keys and shafts

and free, a link connected at one end by a universal joint with said arm and at the other end by a universal joint with said steering-frame at a point at one side of its axis, a steering-shaft, and a gear mounted on said shaft and meshing with the first-named gear.

2. In a vehicle, the combination with a running-gear frame, and an axle and wheels mounted to oscillate with respect to said axle, of a steering-frame supported by said running-gear frame upon a vertical axle and connected by links with said wheels, a skew-gear supported upon a horizontal axle below the vehicle-body and having an arm to swing to and fro, a link connected at one end by a universal joint with said arm and at the other end by a universal joint with said steering-frame at a point at one side of its axis, a vertical steering-shaft, and a gear mounted on said shaft, and meshing with said skew-gear.

3. In a vehicle, the combination with a body, a steering-shaft supported upon said body and provided with a skew-gear, a second gear supported by said body in mesh with the first-named gear, an arm carried with said last-named gear, and a link connected with said arm, of a steering-frame having an arm at substantially right angles to the direction of the link and connected therewith with freedom of movement in different directions, an axle, wheels mounted to oscillate with respect to said axle, and links connecting the supports of said wheel with said steering-frame at separated points on opposite sides of a central line.

4. In a vehicle, the combination of a body, a steering-shaft and co-operating skew-gears mounted upon said body, a running-gear frame comprising a horizontally-pivoted axle adapted to have movement in a vertical plane, independent steering-wheels carried by said axle, a steering-frame pivoted to said axle and having the axis of its pivot substantially in the plane of movement of the axle, a fixed arm on said steering-frame, connections between said arm and one of the skew-gears permitting free movement in different directions and connections from said frame to said wheels.

5. In a vehicle, the combination of a running-gear frame comprising a horizontally-pivoted axle, wheels mounted to oscillate with respect to said axle, a steering-frame pivotally mounted upon the axle and having a plurality of arms diverging from the pivotal point, connections between two of said arms and the wheels, a vehicle-body, a steering-shaft mounted upon said vehicle-body and provided with a gear, a skew-gear supported by the body and in mesh with the gear of the steering-shaft, an arm carried with the last-named gear, and connections between said arm and the third arm of the steering-frame permitting free movement in different directions.

6. In a vehicle, the combination of a running-gear frame comprising a relatively movable axle provided with wheels pivotally mounted to oscillate with respect to the axle, a vehicle-body spring supported with relation to the axle, a steering-frame pivoted to said axle on a substantially vertical axis, a steering-shaft mounted upon the body and bearing a gear, an arm adjustably mounted with relation to said shaft, a segmental skew-gear fixed to said arm and meshing with the gear of the steering-shaft, connections between said arm and the steering-frame permitting free movement in different directions, and connections between the steering-frame and the wheels.

7. In a vehicle, the combination of a running-gear frame including an axle relatively movable in a vertical plane, wheels mounted to oscillate with respect to said axle, a series of arms diverging from a common center, said central point forming a pivotal connection between the arms and axle, a vehicle-body spring supported with relation to the axle, a steering-shaft supported upon the body and provided with a gear, a skew-gear meshing with the gear of the steering-shaft adjustably toward and away from said gear and having a dependent arm, connections between said arm and one of the diverging arms permitting free movement in different directions, and connections between the other arms and the wheels.

8. In a vehicle, the combination of a running-gear frame including an axle relatively movable in a vertical plane, wheels mounted to oscillate with respect to said axle, a series of arms diverging from a common center, said central point forming a pivotal connection between the arms and axle, the pivot being located below the axle substantially in the plane

of the axle, a vehicle-body, a steering-shaft supported upon said body and provided with a gear, a skew-gear meshing with the gear of the steering-shaft mounted upon an adjustable pivot and having a dependent arm, connections between said arm and one of the diverging arms permitting free movement in different directions, and connections between the arms and the wheels.

9. In a vehicle, the combination of a running-gear frame including an axle relatively movable in a vertical plane, wheels mounted to oscillate with respect to said axle, a vehicle-body spring supported upon the running-gear frame, a steering-frame comprising a series of divergent arms, the frame as a whole pivoted to the axle of the running-gear frame and having its axis obliquely disposed to the axis of the axle-pivot, a pair of skew-gears mounted upon the body and adjustable with relation to each other, a steering-shaft secured to one of said gears, an arm dependent from the second of said gears, connections between the arm and the steering-frame, and connections between the steering-frame and the wheels.

10. In a vehicle, the combination of a running-gear frame including an axle member pivoted for vertical oscillation and bearing wheels mounted to oscillate with respect to said axle, a pivoted steering-frame adapted to oscillate in a substantially horizontal plane, and having its axis substantially in the plane of movement of the axle, a steering-shaft, a gear secured thereto, a skew-gear in mesh with the gear of the steering-shaft and mounted upon a rotarily-adjustable pivot, connections between the last-named gear and the steering-frame permitting free movement in different directions, and connections between the steering-frame and the wheels whereby relative movement is permitted between the steering-shaft and the steering-frame and between the axle and the wheels.

11. In a vehicle, the combination of a spring-supported body, a steering-shaft and back-lock transmitting mechanism mounted upon said body, a running-gear frame, an axle relatively movable in a vertical plane, wheels pivotally mounted to oscillate with respect to the axle, a steering-frame pivotally mounted on the axle, positive link connections between said frame and said wheels, and positive, but flexible, link connections between said frame and said transmitting mechanism on the body.

12. In a vehicle, the combination of a spring-supported body, a steering-shaft and back-lock transmitting mechanism mounted upon said body, a running-gear frame, an axle relatively movable in a vertical plane, wheels pivotally mounted to oscillate with respect to the axle and positive, but flexible, connections between said back-lock transmitting mechanism and said wheels.

13. In a vehicle, the combination of a spring-supported body, a steering-shaft and back-lock transmitting mechanism mounted upon said body, a running-gear frame, wheels pivotally mounted to oscillate with respect to said frame, and positive, but flexible, connections between said back-lock transmitting mechanism and said wheels.

14. In a vehicle, the combination of a spring-supported body, a steering-shaft and back-lock transmitting mechanism mounted upon said body, an axle relatively movable in a vertical plane, wheels pivotally mounted to oscillate with respect to the axle, and operative link connections between said back-lock transmitting mechanism and said wheels having joints capable of movement in different directions whereby positive action is secured with flexibility to accommodate the relative movements of the body and axle.

15. In a vehicle, the combination of a spring-supported body, a steering-shaft and back-lock transmitting mechanism mounted upon said body, an axle relatively movable in a vertical plane, wheels pivotally mounted to oscillate with respect to the axle, a vertical arm secured to said back-lock transmitting mechanism and connections between said arm and said wheels including links and levers connected by joints capable of movement in different directions whereby positive action is secured with flexibility to accommodate the relative movements of the body and axle.

16. In a vehicle, the combination of an axle, a body-spring supported with reference to the axle, a steering-shaft having a skew-gear at its lower end, bearings for said shaft mounted on said body, a gear-center also mounted on the body in mesh with said skew-gear, a substantially vertical arm connected with said gear-center, a substantially horizontal link connected to said arm, a second arm connected to said link and substantially at right angles therewith, said axle pivoted on said axle, and operative connections from said last-named arm to said axle.

17. In a vehicle, the combination of an axle, a body-spring supported with reference to the axle, a steering-shaft having a skew-gear at its lower end, bearings for said shaft mounted on said body, a gear-center also mounted on the body in mesh with said skew-gear, a substantially vertical arm connected with said gear-center, a substantially horizontal link connected to said arm by a joint having freedom for movement in different directions, a second arm also connected to said link by a joint having freedom of movement in different directions and substantially at right angles with said link, said axle pivoted on said axle and operative connections between said second arm and said axle and axle where by said axle and axle are moved together but through different angles.

702,449 HYDROCARBON-BURNER. ARTHUR MEARS, New York, N. Y., assignor to the Pan American Light Company, of New Jersey. Filed Apr. 2, 1901. Serial No. 54,019 (No model.)

Claim.—1. In a hydrocarbon-lamp, the combination with the drum of the lamp, a vaporizer for the oil situated within said drum, a burner or burners below said vaporizer, and means for mixing air with said vapor and supplying it to the burner, of means for primarily heating the vaporizer, said means comprising a tubular guide fixed at one end radially in the wall of the drum below the level of the vaporizer, a trough to contain a volatile liquid mounted in the guide, said trough and tube having igniting apertures which register when the trough is pushed in under the vaporizer, and means for guiding said trough in its movements in the tube, substantially as set forth.

2. In a hydrocarbon-lamp, the combination with the drum of the lamp, a vaporizer in the drum, a burner below the vaporizer, a mixer in operative relation to the vaporizer, and a conduit connecting the mixer and burner, of a tubular guide secured in the drum in a radial position and provided with a slot and a hole or holes, of the trough slidably mounted in the guide and provided with a thumb-piece engaging the slot in the guide, and a hole or holes, adapted to register with the holes in the guide when the trough is pushed in, substantially as set forth.

3. In a hydrocarbon-lamp, the combination with the drum of the lamp, the burner or burners thereunder, the vaporizer in the drum above the burner, said vaporizer having its outlet or discharge exterior to the drum, a mixer exterior to the drum and in operative relation to the vaporizer, said mixer comprising an outer casing and an inner tubular receiver, said receiver being contracted at its middle and flared at its ends, and a pipe leading from the lower side of said outer casing to the lower portion of the burner, substantially as set forth.

4. In a hydrocarbon-lamp, the combination with the drum, the burner or burners below the drum, a transverse vaporizer above and over the burner, a mixer connected with the vaporizer, and a pipe to conduct the mixed vapor and air to the burners, of means for primarily heating the vaporizer, said means consisting of a guide extending into the drum below the vaporizer, its receiving and being exterior to the drum, and a trough to contain a combustible slidably mounted in said guide and extending out into the guide exterior to the drum, said guide and trough having coincident holes for igniting the combustible, substantially as set forth.

5. In a hydrocarbon-lamp, the combination with the drum and the vaporizer extending across the same diametrically, of a burner-tube extending across said drum above the vaporizer and fixed rigidly in the drum, an upright pipe in the axis of the drum and forming the suspending stem of the lamp, the small jet-tube at the lower end of the said pipe to provide a permanent jet, and means for admitting gas to the burner-tube, substantially as set forth.

702,450. METHOD OF FINISHING THE SURFACE OF LEATHER. CHARLES J. MILLER, Philadelphia, Pa. Filed May 2, 1902. Serial No. 106,578 (No specimens.)

Claim.—The hereinbefore-described method of finishing the surface of leather, which consists in pressing the leather between two parallel surfaces, one or both of which are heated.

702,451. FOLDING OPERA-CHAIR. ALBERT R. MILLER, Canal Dover, Ohio, assignor to the A. R. Miller Seating Co., Canal Dover, Ohio. Filed May 25, 1901. Serial No. 61,578 (No model.)

Claim.—1. A folding chair comprising a suitable standard bifurcated at its upper end, a seat, brackets secured to the bottom thereof, a pivot-bolt passing through the brackets and the bifurcated portion of the standard, extensions on said brackets, a spring for automatically throwing the seat out of operative position comprising oppositely-disposed members looped around the pivot-bolt, and extended in opposite directions to respectively engage the standard and the seat-bottom, a back, oppositely-disposed brackets on said back pivotally connected to the standard, downwardly-extending projections on the brackets, springs on the standard adapted to normally throw the back into vertical position, upwardly-extending projections also on the brackets, adapted to be engaged by the extensions on the seat-bracket, and stops on the standard adapted to limit the forward movement of the back.

2. A folding chair comprising a suitable standard bifurcated at its upper end, a seat-section, brackets thereon, a pivot-bolt extending through said brackets and the bifurcated portion of the standard, a spring coiled around the pivot-bolt and adapted to normally hold the seat in vertical position, a back, brackets thereon, a pivot-bolt extending through the bifurcated portion of the standard and through the brackets on the back, stops on the standard, downwardly-extending projections on the back-brackets, extensions on the seat-brackets, said projections being adapted to engage the extensions on the back-brackets to automatically incline the back when the seat is lowered.

702,452. ELECTRIC SYNCHRONOUS APPARATUS. WILLARD M. MINER, Plainfield, N. J. Filed July 25, 1901. Serial No. 69,642. (No model.)

Claim.—1. In a synchronizing apparatus for telephonic, telegraphic and other purposes, the combination of a vibrator, two generators brought into action in turn thereby, a synchronizing circuit to whose opposite terminals said generators are respectively connected by poles of the same sign, and connections from the poles of said batteries of the opposite sign to the two portions of the vibrator respectively, as and for the purpose set forth.

2. The combination in a synchronizing apparatus for telephonic, telegraphic and other purposes, of a vibrator, a number of actuating-magnets therefor, a main-line relay having a vibrating tongue controlling the action of said magnets as to keep the vibrator in oscillation in time with the reversals of current through the relay, two local batteries or generators connected respectively by poles of the same sign to contacts closed in alternation by said vibrator, and a local synchronizing-circuit having its opposite terminals connected respectively to portions of said battery of the same sign, as and for the purpose described.

3. In a synchronizing apparatus for telephonic, telegraphic and other purposes, the combination substantially as described of the vibrator, two battery or generator circuits closed alternately thereby, an electric motor the terminals of whose armature-circuit are connected respectively to poles of said generators of the same sign, the remaining poles of the generator being connected respectively to the two portions of the vibrator but with the same polarity, and field-magnets for said motor retained in shunt or branches respectively from said local generators.

4. In a synchronizing apparatus for telephonic, telegraphic and other purposes, the combination substantially as described of a vibrator having two sets of contacts closed in alternation to batteries or generators whose circuits are closed by said contacts, a synchronously-operating motor, an armature therefor through which the currents from said batteries are made to flow in alternation by the operation of the vibrator, but in opposite directions, and field-magnets for said motor maintained in shunt or branches taken from the generator-circuits at points between said generators and the vibrator-contacts.

702,453. ELECTRIC SYNCHRONOUS APPARATUS. WILLARD M. MINER, Plainfield, N. J. Filed July 25, 1901. Serial No. 69,643. (No model.)

Claim.—1. In a synchronizing apparatus for telephonic, telegraphic and other purposes, the combination substantially as described of a synchronous vibrator, a pair of actuating-magnets therefor, a synchronizing-relay and contacts and connections as described whereby said relay may close and open short or short circuits for a suitable source of energy, around said vibrator-magnets in turn, as and for the purpose described.

2. In a synchronizing apparatus for telephonic, telegraphic and other purposes, the combination substantially as described, of a vibrator, a local synchronizing-circuit controlled thereby, an actuating magnet or magnets for the vibrator, a synchronizing-relay responsive to pulsations or changes of electrical condition periodically produced upon a main line and contacts and connections whereby the relay-lever may alternately open and close a shunt or circuit for a suitable source of energy around the vibrator-magnets in turn, as and for the purpose described.

3. In a synchronizing apparatus for telephonic, telegraphic and other purposes, the combination substantially as described of a vibrator controlling a local synchronizing-circuit and a main-line relay responsive to po-

litical reversals of current on a main line, actuating-magnets for the vibrator provided with circuits and connections to the relay-contacts and to a suitable generator whereby a short circuit for said generator may be closed around said magnets alternately, and a spark-preventing device in a shunt across the terminals of one or both magnets for the vibrator, as and for the purpose described.

4. In a synchronizing apparatus for telephonic, telegraphic and other purposes, the combination with the vibrator and its actuating-magnets, of the line-relay, a suitable source of electric energy and contacts and connections as described whereby a short circuit for the generator-current may be completed around said magnets alternately and synchronously with the main-line pulsations and an electric lamp placed in a shunt across terminals of the vibrator-actuating magnets.

5. In a synchronizing apparatus for telephonic, telegraphic and other purposes, the combination substantially as described with supply-wires or connections 18 leading from a source of any voltage or potential, of two or more lamps placed in series across said wires, a vibrator having a pair of actuating-magnets, a relay controlling the flow of current through said vibrator-magnets in turn and a local supply-circuit for said magnets formed by a shunt around one or more of said lamps and including contacts of the relay, as and for the purpose described.

6. In a synchronizing apparatus, the combination with an electric motor of a vibrator, generators connected alternately to the armature of the motor by the action of said vibrator and a field-magnet circuit for the motor supplied by a shunt from the outside terminals of said generators.

7. In a synchronizing apparatus, the combination of an electric motor, a local generator, a vibrator controlling the connection of the generator and motor-armature, and a field-magnet circuit connected to said generator but in shunt to the armature and vibrator contacts.

702,454. ELECTRIC SYNCHRONOUS APPARATUS. WILLARD M. MINER, Plainfield, N. J. Filed July 25, 1901. Serial No. 69,644. (No model.)

Claim.—1. The combination substantially as described with a synchronous motor, of a main-line relay in a synchronizing-circuit, an electromagnetic vibrator having its operating-magnets in circuits leading from a suitable electric-power circuit through the contacts of the relay, an armature-winding for the motor, two local batteries and connections from the same to the contacts of the vibrator adapted to be closed to cause a reversal of current-flow in the armature-winding by the action of said batteries alternately, and a separate armature-winding supplied from the electric-power circuit in multiple with the operating-magnets of the vibrator.

2. In a synchronizing apparatus for an electric motor, the combination substantially as described of a main-line relay, an electromagnetic vibrator, a power-circuit supplying energy to the vibrator magnets through the contacts of the relay, a synchronizing-circuit on the motor-armature, a local battery or generator from which currents are made to flow alternately in opposite directions through the said synchronizing-winding by the action of the vibrator, an independent armature-circuit for the motor, a field-winding therefor and connections for supplying said independent armature and field with current from the power-wire in multiple with the operating-magnets of the vibrator.

3. In a synchronizing apparatus for an electric motor, the combination substantially as described of a main-line relay in the synchronizing-circuit, a vibrator having a number of operating-magnets brought into action alternately through the vibration of the relay, a synchronizing-circuit on the armature of the motor, two or more local generators or sections of generator connected alternately into the circuit of the armature over

the contacts of the vibrator to cause reversal of current-flow thereon, an independent power-winding on the armature, an electric-power circuit supplying current continuously in the same direction to the commutator of said power-winding, and a field-magnet for the motor supplied in multiple with said armature power-winding from the power-circuit.

702,455. BREECH MECHANISM FOR GUNS. LEONARD H. D. MINER, Bethlehem, Pa., assignor to Bethlehem Steel Company, Smith Bethlehem, Pa., a Corporation of Pennsylvania. Filed Nov. 13, 1901. Serial No. 62,143. (No model.)

Claim.—1. The combination with the breech of a gun, of lugs 1, 2 separated to receive a portion of the carrier-plate between them, and a lug 3 below and separated from the lug 2 to receive the end of the operating-lever, said lugs, carrier-plate and lever being perforated for the reception of a hinge-pin, substantially as set forth.

2. The combination with the breech of a gun and with the carrier-plate thereof, of a hinge-pin passing through coinciding openings in the breech and plate, a key, a lug below the same on the pin, an annular groove around the opening in the plate below the top edge thereof, and a recess extending from said groove to the said edge, substantially as set forth.

3. The combination with the breech of a gun, of separated lugs, a

carrier-plate extending between said lugs, a hinge-pin extending through the lugs and carrier-plate, a groove forming an annular shoulder on the carrier-plate below the upper edge thereof, a recess extending from said shoulder to the said edge, a key on the pin adapted to a key-slot in the upper lug, and a projection below said key adapted to said recess, substantially as set forth.

4. The combination with the breech of a gun and with a carrier-plate, and a lever having coinciding openings to receive a hinge-pin, of a key, a projection below the same on the pin, a keyway in the breech to receive the key, a shoulder on the carrier-plate below the top edge, and a recess between the said edge and the shoulder arranged to coincide with the keyway when the carrier-plate is at an angle to the breech, substantially as set forth.

5. The combination of a gun having lugs arranged to receive a carrier-plate and an operating-lever between them, a hinge-pin passing through perforations in the lugs, plate and lever, and with a key and projection below the same, a keyway in the upper lug for said key, an annular shoulder on the plate occupying a position above the projection, and a recess between the shoulder and the upper edge of the plate arranged to coincide with the keyway when the plate is at an angle to the breech, substantially as set forth.

702,456. DRESS-SUPPORTER. ROBERTA F. MONTGOMERY, Barrie, Canada. Filed Aug. 19, 1901. Serial No. 72,816. (No model.)

Claim.—A dress-supporter, consisting of an upper member, comprising a bar having two plane portions inclined at an angle to each other, a hook-shaped lug or hanger depending from the center of the lower inclined portion, a horizontal sleeve formed upon the edge of the said portion near the end, a vertical sleeve formed upon this end of the bar, a shield formed upon the upper edge of the upper portion at the same end as the sleeve, a pin having a coil securely fastened in the two sleeves and the shield, and a hook formed upon the edge of the upper portion to receive the pointed end of the pin, the shield and hook being upon the inner side of the bar while the lug or hanger and the horizontal and vertical sleeves are upon the outer side of the bar; and a lower member to engage the skirt supported by the lug or hanger of the bar.

702,457. KEY MECHANISM FOR TYPE-SETTING MACHINES. FRANK MCCLISTOCK, Mount Vernon, N. Y., assignor, by mesne assignments, to Edwin C. Hoyt and Felix Rosen, New York, N. Y. Filed May 12, 1900. Renewed Jan. 16, 1902. Serial No. 90,063. (No model.)

Claim.—1. In combination with a key-lever, means for causing the operation of type-ejecting mechanism, a flexible connecting-wire whereby the movement of the key-lever is imparted to the type-ejecting mechanism, and means substantially as described, located at the rear end of the said key-lever for adjusting the length of the wire.

2. In combination, a key-lever notched at the inner end as shown, means for causing the operation of type-ejecting mechanism, a flexible connecting-wire, and flat adjusting-screw to which said wire is attached fitted in an open slot at the rear end of the key-lever for adjusting the length of the wire.

702,458. MACHINE FOR SETTING TYPE. FRANK MCCLINTOCK, Mount Vernon, N. Y., assignor, by mesne assignments, to Edwin C. Hoyt and Felix Rosen, New York, N. Y. Filed June 24, 1901. Serial No. 65,733. (No model.)

Claim.—1. In a type-setting machine, the combination of a constantly-rotating shaft carrying a ratchet-wheel; a type-case from which the types are ejected; a type-ejecting rod arranged to eject the lowest type from the type-case; a sliding rod provided with ratchet-teeth arranged to engage with the ratchet-wheel and to intermittently advance the type-ejector; a lever actuated by a key-lever for effecting connection between the type-ejecting rod and the ratchet-wheel; means for automatically releasing the type-ejector after the same has been advanced; and spring devices for retracting the same to its original position.

2. In a type-setting machine, the combination of a constantly-rotating shaft carrying a ratchet-wheel; a type-case from which the types are ejected; a type-ejecting rod arranged to eject the lowest type from the type-case; a sliding rod provided with ratchet-teeth arranged to be temporarily brought into engagement with the ratchet-wheel and adapted to advance the type-ejector; means, substantially as described, for holding the rod in engagement until the ejector has ejected a type; means for automatically releasing the type-ejector after the same has been advanced; a lever actuated by a key-lever for effecting the connection between the rod and the ratchet-wheel; and spring devices for retracting the type-ejector to its original position.

3. In a type-setting machine, the combination of a constantly-rotating shaft carrying a ratchet-wheel; a type-case from which the types are ejected; a type-ejecting rod, arranged to eject the lowest type from the type-case; a sliding rod, one end of which is arranged to engage the type-ejector, provided with ratchet-teeth arranged to engage with the ratchet-wheel, and having a projecting shoulder; a stud on the frame which holds the rod in engagement with the ratchet-wheel by means of the projecting shoulder until the end of the line of travel is reached and then per-

mits it to drop, and a lever actuated by a key-lever for effecting the connection between the rod and the ratchet-wheel.

4. In a type-setting machine, the combination of a constantly-rotating shaft carrying a ratchet-wheel; a type-case from which the types are ejected; a type-ejecting rod, arranged to eject the lowest type from the type-case; a sliding rod, one end of which is arranged to engage the type-ejector, provided with ratchet-teeth arranged to engage with the ratchet-wheel, and having a projecting shoulder; a stud on the frame which holds the rod in engagement with the ratchet-wheel by means of the projecting shoulder until the end of the line of travel is reached and then permits it to drop, and a lever actuated by a key-lever one end of which raises the sliding rod into engagement with the ratchet-wheel, and a spring for retracting the lever after the engagement has been effected.

5. In a type-setting machine, the combination of a constantly-rotating shaft carrying a ratchet-wheel; a type-case from which the types are ejected; a type-ejecting rod, arranged to eject the lowest type from the type-case; a sliding rod, one end of which is arranged to engage the type-ejector, provided with ratchet-teeth arranged to engage with the ratchet-wheel and having a projecting shoulder; a stud on the frame which holds the rod in engagement with the ratchet-wheel by means of the projecting shoulder until the end of the line of travel is reached and then permits it to drop; a lever actuated by a key-lever for effecting the connection between the rod and the ratchet-wheel; and device actuated at the will of the operator for restoring the parts if they become blocked.

6. In a type-setting machine, the combination of a constantly-rotating shaft carrying a ratchet-wheel; a type-case from which the types are ejected; a type-ejecting rod, arranged to eject the lowest type from the type-case; a sliding rod, one end of which is arranged to engage the type-ejector, provided with ratchet-teeth arranged to engage with the ratchet-wheel and having a projecting shoulder; a stud on the frame which holds the rod in engagement with the ratchet-wheel by means of the projecting shoulder until the end of the line of travel is reached and then permits it to drop, a lever actuated by a key-lever one end of which raises the sliding rod into engagement with the ratchet-wheel and serves as a stop to engage the projecting shoulder of the sliding rod, and prevent the mechanism from repeating, a spring for retracting the lever after the engagement has been effected; and a guide-block for positively retaining the sliding rods in engagement.

7. In a type-setting machine, the combination of a constantly-rotating source of power; a type-case from which the types are ejected; a type-ejecting rod arranged to eject the lowest type from the type-case; means, substantially as described, for intermittently advancing the space-ejector bar by means of the rotating shaft; means actuated by a key-lever for effecting the connection between the actuating device and the shaft; a suitable frictional connection between the source of power and the device for intermittently advancing the space-ejector; and spring devices for retracting the space-ejector to its original position.

8. In a type-setting machine, the combination of a constantly-rotating shaft; a ratchet-wheel connected thereto by a frictional connection; a type-case from which the types are ejected; a type-ejecting rod arranged to eject the lowest type from the type-case; a sliding rod provided with ratchet-teeth arranged to engage with the ratchet-wheel and to intermittently advance the type-ejector; a rod actuated by a key-lever for effecting the connection between the ejector-rod and the ratchet-wheel; and spring devices for retracting the space-ejector to its original position.

9. In a type-setting machine, the combination of a constantly-rotating shaft; a ratchet-wheel connected thereto by a frictional connection; means, substantially as described, for intermittently advancing the space-ejector by means of the rotating shaft; spring devices for retracting the same to its original position; and devices connected with the channels in the type-case, substantially as described, whereby the exhaustion of the type causes the locking of the mechanism.

10. In a type-setting machine, the combination of a constantly-rotating shaft; a ratchet-wheel connected thereto by a frictional connection; means, substantially as described, for intermittently advancing the space-ejector by means of the rotating shaft; spring devices for retracting the same to its original position; devices, connected with the channels in the type-case, substantially as described, whereby the exhaustion of the type causes the locking of the mechanism; and device, substantially as described, actuated at the will of the operator, for unlocking and restoring the mechanism to its original position.

11. In a type-setting machine, the combination of a constantly-rotating shaft; a ratchet-wheel connected thereto by a frictional connection; means, substantially as described, for intermittently advancing the space-ejector by means of the rotating shaft; spring devices for retracting the same to its original position; devices, connected with the channels in the type-case, substantially as described, whereby the exhaustion of the type causes the locking of the mechanism; mechanism, substantially as described, for unlocking and restoring the parts to their original position, and a lever for actuating the unlocking mechanism.

702,459. TYPE-JUSTIFYING MACHINE. FRANK MCCLINTOCK, Mount Vernon, and FREDERICK HOLZOWORTH, New York, N. Y., assignors, by mesne assignments, to Edwin C. Hoyt and Felix Rosen, New York, N. Y. Filed June 24, 1901. Serial No. 65,514. (No model.)

Claim.—1. The combination of a side plate; an inclined track or way upon which the line-holder travels; a line-holder traveling on said track; a lever pivoted in a suitable groove in the side plate so as to engage with and hold the line-holder; a spring whereby the lever is normally held in engagement with the line-holder; and device substantially as described for retracting the lever and releasing the line-holder at the will of the operator.

2. The combination of a side plate; an inclined track or way upon which the line-holder travels; a line-holder traveling on said track; a lever pivoted in a suitable groove in the side plate so as to engage with and hold the line-holder; a spring whereby the lever is normally held in engagement with the line-holder; device substantially as described, for regulating and controlling the tension of the spring; and a suitable key-lever for retracting the lever and releasing the line-holder at the will of the operator.

3. The combination of a side plate; an inclined track or way upon which the line-holder travels; a line-holder traveling on said track; a lever pivoted in a suitable groove in the side plate so as to engage with and hold the line-holder; a spring whereby the lever is normally held in engagement with the line-holder; a second lever pivoted in the groove, provided with a spring at one end arranged to engage with and retard the movement of the line-holder as it descends the track; and means substantially as described for retracting the lever and releasing the line-holder at the will of the operator and at the same instant actuating the lower lever and causing the spring to assume a position where it engages with and retards the line-holder as it descends.

4. The combination of a side plate; a line-holder elevator moving thereon, having a projection arranged to extend outwardly through an opening in the side plate; an escapement-lever attached to the side plate, arranged to engage therewith; and device substantially as described, for actuating the escapement-lever.

5. The combination of a side plate; an inclined track or way upon which the line-holder travels; a line-holder traveling on said track; a lever pivoted in a suitable groove in the side plate so as to engage with and hold the line-holder; a spring whereby the lever is normally held in engagement with the line-holder; a line-holder elevator having a projection arranged to extend outwardly through an opening in the side plate of the machine; an escapement-lever attached to the side plate, arranged to engage therewith and device substantially as described for retracting the lever and releasing the line-holder at the will of the operator, and for actuating the escapement-lever at the appropriate moment.

6. The combination of a side plate; an inclined track or way upon which the line-holder travels; a lever pivoted in a suitable groove in the side plate so as to engage with and hold the line-holder; a spring where-

by the lever is normally held in engagement with the line-holder; a second lever pivoted in the groove; provided with a spring at one end arranged to engage with and retard the movement of the line-holder as it descends the track; a line-holder elevator, having a projection arranged to extend outwardly through an opening in the side plate of the machine; an escapement-lever attached to the side plate, arranged to engage therewith; and means substantially as described for retracting the lever and releasing the line-holder at the will of the operator and at the same instant actuating the lower lever and causing the spring to assume a position where it engages with and retards the line-holder as it descends, and for actuating the escapement-lever at the appropriate moment.

702,460. SHADE-HOLDER. AUGUST MCNEER, Providence, R. I. Filed Nov. 14, 1901. Serial No. 59,960. (No model.)

Claim.—In a shade-holder of the character described, the combination with a supporting-ring provided with fixed ears, a bar hinged to the supporting-ring and provided with an ear at its free end and with a catch-clip to engage the inner periphery of the ring and hold the ear at the end of the bar in locked position, and means for securing the ring to the lamp-socket, substantially as set forth.

702,461. TURNING WHEEL. JOHANNES HANSEN, Dresden, Germany. Filed Dec. 10, 1901. Serial No. 56,282. (No model.)

Claim.—A turbine wheel composed of a series of thin metal plates having a series of channels around their edges, clamping-checks to hold said plates together and means for attaching the whole to a driving-shaft, a peripheral ring to support and close around the edges of all the plates in the manner and for the purpose substantially as described.

702,462. BRIDGING FOR JOINTS. CHARLES O. NELSON, Winnetka, Ill., assignor of eleven-fifths to Horace H. Capron, Winnetka, Ill. Filed Dec. 22, 1901. Serial No. 56,955. (No model.)

Claim.—1. An improved metallic bridging for joints, &c., comprising a rod or web provided at its ends with oppositely-turned points adapted to be driven into the upper and lower portions of adjacent joints, substantially as and for the purpose set forth.

2. An improved metallic bridging for joints, &c., comprising a body portion or web of sufficient length to extend from near the top of one joint to near the bottom of the adjacent joint and provided with oppositely-turned points and adjacent to said points with driving-heads, substantially as and for the purpose set forth.

3. An improved metallic bridging for joints, &c., comprising a web *a*, driving-heads *a'* on opposite sides of the web *a*, said driving-heads being formed by swaging the material at the ends of the web, and oppositely-turned driving-points adjacent to said driving-heads, substantially as and for the purpose set forth.

4. The combination with joints *A, A'*, of metallic bridging members *B, B'* connecting said joints, each of said members extending from the top of one joint to the bottom of the adjacent joint and having at its ends op-

positively-turned driving-points embedded in the material of the joints, substantially as and for the purpose set forth.

5. A metallic bridging comprising a web and angularly-disposed ends arranged to extend diagonally between joints and to be secured thereto by having said angular ends driven therein, substantially as described.

6. A metallic bridging for joints comprising a web arranged to extend across one edge of a joint and thence diagonally to the further edges of the next adjoining joints on each side thereof, and sharpened ends adapted to engage each of said adjoining joints, substantially as described.

7. A metallic bridging comprising a web adapted to extend diagonally between joints, and sharpened ends angularly disposed with relation to said web so as to form driving-heads whereby said ends may be driven into joints, substantially as described.

8. A metallic bridging comprising a web, sharpened ends angularly disposed with relation to said web, the bridging having its sides flattened at the angle between the web and the ends so as to form driving-heads, substantially as described.

702,463. AUTOMATIC WEIGHING-SCALE. ELLA NILSON, Wayzata, Minn. Filed Mar. 11, 1901. Serial No. 50,373. (No model.)

Claim.—1. In an automatic scale, engaging members rocking one upon the other and each having movable pivots one near the end of one member and the other centrally disposed with respect to the contacting surface of the other member.

2. In an automatic scale, the combination, with opposing contacting members rocking one upon the other, of relatively movable pivots therefor provided one near the end of one member and the other centrally disposed with respect to the contacting surface of the other member, and means for preventing the longitudinal movement of one member with respect to the other.

3. In an automatic scale, the combination, with opposing members acting one upon the other each having movable pivots one near the end of one member and the other centrally disposed with respect to the contacting surface of the other member, of platform and scale connections for one of said members, substantially as described.

4. In an automatic scale, opposing contacting members having respectively plane and curved faces and rocking one upon the other, the pivots of said members being located respectively near the end of one member and centrally arranged with respect to the other and said members having respectively a longitudinal and a vertical oscillating movement, substantially as described.

5. In an automatic scale, the combination, with an opposing contact-lever and a bar rocking one upon the other and having relatively movable pivots located respectively near the end of one and the center of the other, of an indicator a dial, and operative connections provided between said lever and said indicator, for the purpose specified.

6. In an automatic scale, an opposing or contacting lever and a bar having respectively curved and plane faces and rocking one upon the other, said lever and bar having respectively a longitudinally and vertically oscillating movement, and a balance-weight adapted to exert its force centrally with respect to said bar.

7. In an automatic scale, a rocking lever 10 and links 11 whereon said lever is suspended, in combination, with a bar 19 engaging said lever 10, a yoke 20, and a link 24, the pivots of said yoke and link being equally spaced.

8. In an automatic scale, the combination, with a rocker-lever 10 and links 11, of a bar 19 contacting with said lever 10, a yoke 20 and a link 24 whereon said bar 19 is centrally pivoted, and a balance-weight centrally supported on said bar 19, substantially as described.

9. In an automatic scale, the combination with standards 4, of an opposing lever 10 and bar 19, links 11 and 24 and a yoke 20 pivoted in said standards and whereon said lever and bar are pivoted respectively, an indicator-hand, a dial, and operative connections provided between said lever 10 and said indicator-hand.

10. In an automatic scale, the combination, with a support, of an opposing or contacting lever and a bar rocking one upon the other, pivoted connections 20 and 24 provided between said support and said bar, the centers of said pivoted connections being a corresponding distance apart whereby said bar will describe a true arc in its vertical movement, and a weight carried by said bar between said pivoted connections, substantially as described.

11. The combination, with the standards 4, of an opposing contacting lever and a bar rocking upon the other, links 11 whereon said lever is supported upon said standards, a yoke 20 pivotally connecting said standards with the middle portion of said bar, a rod 21 provided on said bar, a link 24 connecting the upper portion of said rod 21 with said standards, the pivotal centers of said link 24 and said yoke being an equal distance apart, and a balance-weight carried by said rod 21, substantially as described.

12. In an automatic scale, opposing members rocking one upon the other each having movable pivots arranged one near the end of one member and the other near the center of the contacting surface of the other member, and a balance-weight centrally supported upon one of said members, substantially as described.

13. In an automatic scale, the combination, with a lever and a bar pivoted one near its end and the other near its center and having a rocking contact one upon the other, link members having their pivots equally spaced and whereon said bar has a substantially vertical oscillating movement, and a balance-weight centrally supported on said bar between said link members.

14. In an automatic scale, a rocking lever and its pivots, in combination, with an oscillating member opposing said lever, a support, guiding means pivotally connecting said support and said member, the pivots of said guiding means at one end thereof being equally spaced from the corresponding pivots at the other end, for the purpose specified.

15. In an automatic scale, a rocking lever and its pivots, in combination, with an oscillating member opposing said lever, a support, guiding means pivotally connecting said support and said member, the pivots of said guiding means at one end thereof being equally spaced from the corresponding pivots at the other end, and a balance-weight supported by said member, substantially as described.

16. In an automatic scale, a rocking lever and an oscillating member opposed thereto, a support, guiding means pivotally connecting said support and said member, the pivots of said guiding means on said support and the pivot of said lever being at corresponding ends of said means and said lever, and the pivots of said guiding means at one end of said member being equally spaced from the opposite corresponding pivots, substantially as described.

17. In an automatic scale, a standard or support, in combination with a rocking lever suspended thereon, a bar opposing said lever and whereon said lever rocks, and guiding devices pivoted on said support and between which said bar is suspended, substantially as described.

18. In an automatic scale, a suitable standard or support, in combination, with a rocking lever suspended thereon, a member opposing and contacting with said lever, a balance-weight carried by said member, and guiding devices pivoted on said support and between which said member is suspended, said guiding devices being at the end of said member adjacent to the suspended end of said lever, substantially as described.

702,464. PHOTOGRAPHIC CAMERA. CHRISTIAN F. J. NIM, Hinkley, Ill. Filed Sept. 25, 1901. Serial No. 78,560. (No model.)

Claim.—1. In a camera, a bellows having a rear opening, said bellows being adjustable to permit the contraction and expansion of said opening.

2. In a camera, a bellows having longitudinal divisions and covering-strips therefor.

3. In a camera, a bellows divided longitudinally into a number of sections, covering-strips arranged at the division-point, said covering-strips being flexibly connected to the body of the bellows.

4. In a photographic camera, an extensible rear frame having adjustable members to permit its expansion and contraction.

5. In a photographic camera, a fixed forward frame, and extensible rear frame having adjustable members to permit its expansion and contraction, and a laterally-adjustable bellows connecting said frames.

6. In a photographic camera, a frame having corner-sections, central blocks connecting the corner-sections, a bellows divided longitudinally and having its main body portion formed into sections connected to said corner-sections, covering-strips arranged at the divisional points, said covering-strips being secured to said blocks, substantially as specified.

7. In a photographic camera, a rear frame having adjustable corner-sections, central blocks adapted to recess in the corner-sections, exterior slotted strips on said frame, means for locking the frame in any adjusted position, and an adjustable bellows connected to said frame, substantially as specified.

8. In a photographic camera, a sectional frame, plate-holding clips secured thereto, said clips being adjustable to different distances from the rear of the frame to accommodate the plate-holders of varying thickness.

9. In a photographic camera, a sectional frame comprising corner-pieces having dovetail slots, centrally-disposed sections for uniting the corner-sections, said central sections each comprising a slotted strip disposed in front of the corner-pieces and a dovetail block adapted to the recesses of the corner-sections, a sectional bellows having portions secured to the corner-sections and other portions secured to the central sections, and means for locking said sections in an adjusted position.

10. In a photographic camera, a sectional frame, edge strips arranged exteriorly thereof, the top and one of the side strips being extended rearwardly beyond the frame to form a pocket for the reception of the plate-holder.

702,465. STITCH-INDENTING MACHINE. ADOLPH OLSEN, Philadelphia, Pa. assignor of one-third to John G. McKoon, Philadelphia, Pa. Filed May 23, 1901. Serial No. 62,341. (No model.)

Claim.—1. In a sole-indenting machine, a reciprocating bar and means for actuating it, an indenting-tool adjustable in the slide-bar, a

roller for feeding the shoe step by step alternately with the descent of the indenting-tool, ratchet wheels and pawls for rotating the rollers, means for permitting the operation of one ratchet-wheel independent of the others and means for indicating the distance the roller is actuated by the ratchet, substantially as described.

2. In a shoe-sole-indenting machine, an indenting-tool, a slide-bar to which the tool is secured, guideways for the slide-bar, a power-shaft, a pitman journaled eccentrically on the power-shaft, a lever pivoted at one end of the main frame, a pitman to which the opposite end is connected, a guide for the shoe, a feeding mechanism, means for regulating the feed and for indicating same, substantially as described.

3. In a machine of the character described, a suitable framework adapted to support the operating parts of said machine, an indenting-tool, a slide-bar in which said tool is secured, means for adjusting said tool vertically within said slide-bar, guides arranged upon the framework for guiding said slide-bar, a power-shaft, a pitman journaled eccentrically upon said power-shaft, a lever pivoted at one end to the main frame, and at its other end to the pitman, a pivotal point arranged between two ends of the lever to which the slide-bar is connected, said lever adapted to be composed of two parts pivoted together, each of the parts having a limited movement relative to the other part, means for regulating this movement, a guide against which the upper of the slide-bar is adapted to be held, means for adjusting said guide as to both vertical and horizontal positions, a spring connected to said guide against which the pressure is adapted to be exerted, a roller upon which the shoe is adapted to be held, means for revolving said roller a predetermined distance when the pricking-tool is raised, means for regulating the distance the roller is revolved, and means for indicating such distances, substantially as described and for the purpose specified.

4. In combination with a machine of the character described, an automatic feeding mechanism consisting of a roller upon which the shoe is adapted to be held, a shaft to which said roller is secured, a series of ratchet-wheels secured upon said shaft, each of said series of ratchet-wheels being provided with a different number of teeth to the inch, a series of pawls, one for each of the ratchet-wheels, means for causing the pawls to engage the ratchet-wheels to engage the teeth of the same, springs adapted to hold the pawls in engagement with the teeth, a common lever to which all of said pawls are pivoted, means primarily actuated by the power-shaft to cause said pawls to rotate a predetermined distance concentric with the ratchet-wheel, means for regulating the distance of rotation of the pawls concentric to the ratchet-wheels, and means for indicating at what feed the machine has been set, as and for the purpose specified.

702,466. FILTER. VALENTINE OSTER, St. Louis, Mo., assignor of one-half to Otto F. Knicker, St. Louis, Mo. Filed Oct. 23, 1901. Serial No. 60,573. (No model.)

Claim.—1. In a water-filter, a muddy-water tank; a clear-water tank mounted on the same level and beside the muddy-water tank; a

JUNE 17, 1902.

strainer in a muddy-water tank; and a siphon connection between the strainer in the muddy-water tank and the clear-water tank; said siphon connection consisting of the flexible tube 33; the nipple 34 connected to the flexible tube; the union 35 connected to the nipple; the washer 36 placed between the walls of the tanks; the washer 37 placed inside of the muddy-water tank; the washer 38 inside of the clear-water tank; the tube 39 inserted through the walls of the tanks and through said washers; the nut 40 placed upon said tube against the inner face of the washer 38; the nut 41 placed upon said tube against the inner face of the washer 37.

2. In a filter, a muddy-water tank; a supply-pipe leading to said tank; a valve controlling the supply-pipe; a float controlling the valve pipes leading from the valve strainers mounted under the pipes; sprinklers attached to the pipes in position to wash the strainers so that when the float opens the valve to admit water, the water will pass through the sprinklers as required to wash and clean the strainers substantially as specified.

702,467. LINING-HOOP-MAILING HORSE. WILLARD J. OTT, Chicago, Ill., assignor to Veneer Barrel Machine Co., Chicago, Ill. Filed Mar. 21, 1902. Serial No. 90,336. (No model.)

Claim.—1. In a lining-hoop-mailing horse, the combination of an anvil having a curved upper surface, and having an arm extending rearwardly below said surface and parallel with the axis thereof; and a support mounted on said arm and adjustable along same toward and from said anvil; said support having on its rear part an upwardly-extending stop for the rear end of a barrel, and having a pair of upwardly-disposed lateral arms adjustable toward and from each other for bearing against the periphery of the barrel.

2. In a lining-hoop-mailing horse, the combination of an anvil having a curved upper surface, and having a rod extending rearwardly below said surface and parallel with the axis thereof; and a collar mounted on said rod adjustable longitudinally thereof, having at its rear part an upwardly-extending stop for the rear end of a barrel and having at its upper part a pair of opposite lateral members and an upwardly and outwardly inclined arm movably mounted on each of said lateral members; said inclined arms being adjustable toward and from each other for bearing against the periphery of the barrel.

702,468. RAIL-JOINT. WILLIAM A. FAIR, Dunbar, W. Va. Filed Dec. 31, 1901. Serial No. 57,962. (No model.)

Claim.—1. In a rail-joint, the combination with a rail having a recess in its end and extending through the bottom thereof, said recess having a seat at the upper end thereof and inwardly from the end of the rail, and the bottom of the rail having cut-away portions leading to the recess and disposed in line with the seat, of a second rail having a tongue for engagement with the recess, said tongue having a top lug disposed to engage the seat and having laterally-directed legs disposed to engage the cut-away portions.

2. In a rail-joint, the combination with a rail having a recess in its end extending through the bottom thereof, said recess having a seat at its upper end and disposed inwardly from the end of the rail, and the bottom of the rail having cut-away portions disposed inwardly from the end of the rail and leading to the recess, of a second rail having a terminal

tongue engaged with the recess, said tongue having an upwardly-directed leg engaged with the seat and having laterally-directed legs engaged with the cut-away portions, said walls having aligning perforations, and a bolt engaged with the perforations.

702,469. CARBURTER FOR EXPLOSIVE-ENGINEER. JOSEPH W. PARKIN, Oxford, Pa. Filed Mar. 12, 1901. Serial No. 50,919. (No model.)

Claim.—1. In a carburter, an air-chamber, a substantially cylindrical air-tube having an inlet in said chamber, an oil-nozzle having an outlet in said tube, and an inclined wire-gauze diaphragm in said tube supported by said nozzle between the air-inlet and oil-outlet, substantially as specified.

2. In a carburter, an air-chamber, an air-tube having an inlet in said chamber, said tube being adjustable to regulate the admission of air from said chamber thereto, an oil-nozzle having an adjustable outlet within said tube, and an inclined diaphragm having capillary members in said tube between the air-inlet and oil-outlet, substantially as specified.

3. In a carburter, an air-chamber, a movable mixing-chamber having a substantially cylindrical air-tube depending therefrom and opening into said air-chamber, said mixing-chamber having a perforated head fixed therein, in combination with an oil-nozzle having an outlet within said tube, and a perforated diaphragm in said tube between the air-inlet and oil-outlet, substantially as specified.

4. In a carburter, an air-chamber, a movable mixing-chamber having a substantially cylindrical air-tube depending therefrom and opening into said air-chamber, said mixing-chamber having a perforated head fixed therein, an inverted conical baffle in said mixing-chamber, in combination with an oil-nozzle having an outlet within said tube, and a perforated diaphragm in said tube between the air-inlet and oil-outlet, substantially as specified.

5. In a carburter, an air-chamber, a carburting-chamber, a movable mixing-chamber in said carburting-chamber and having an air-tube depending therefrom into said air-chamber, said mixing-chamber having a perforated head fixed therein, an inverted conical baffle in said mixing-chamber, in combination with an oil-nozzle having an adjustable outlet within said tube, and a wire-gauze diaphragm in said tube between the air-inlet and oil-outlet, said diaphragm being supported by said nozzle and inclined downwardly therefrom, substantially as specified.

6. In a carburter, an air-chamber, a carburting-chamber having a corrugated conical dome or outlet, a movable mixing-chamber in said carburting-chamber and having an air-tube depending therefrom into said air-chamber, said mixing-chamber having a perforated head fixed therein, in combination with an oil-nozzle having an adjustable outlet within said tube, and a wire-gauze diaphragm in said tube between the air-inlet and oil-outlet, said diaphragm being supported by said nozzle and inclined downwardly therefrom, substantially as specified.

7. In a carburter, an air-chamber, an air-tube having an inlet opening in said chamber, an oil-nozzle having an outlet in said tube, a valve for controlling the outlet from said nozzle, an adjustable rod for regulating said valve and outlet, a tube surrounding said rod within said nozzle, said tube having its lower end fixed in the bottom of said air-chamber and its upper end rising above the top of said nozzle, substantially as specified.

8. In a carburter, a casing containing an oil-reservoir and a carburting-chamber, an oil-nozzle leading from said reservoir to said carburting-chamber, said reservoir being provided with a float and a valve controlled thereby for regulating the pressure of oil delivered through said

JUNE 17, 1902.

U. S. PATENT OFFICE.

2589

nozzle, a movable mixing-chamber in said carburting-chamber, an air-tube depending from said mixing-chamber, an air-chamber communicating with said air-tube, and a wire-gauze diaphragm in said air-tube, said diaphragm being supported by said nozzle and inclined downwardly therefrom, substantially as specified.

702,470. STEREOTYPE-PLATE AND BASE. CHARLES S. PARTRIDGE, Chicago, Ill., assignor, by direct and mesne assignments, to Partridge & Anderson Company, Chicago, Ill., a Corporation of Illinois. Filed July 2, 1901. Serial No. 67,947. (No model.)

Claim.—1. The combination with a stereotype-plate having longitudinal grooves in its side edges, of a base comprising separable, interlocking sections and a channelled clamping-strip secured to the column-rule side of each of the outer sections, the lower flange of said clamping-strip being bent along its edge at an angle and embedded in and engaging the body of the section throughout its length, and its upper flange being adapted to engage the adjacent grooved edge of said plate and detachably lock the latter in its entire length.

2. The combination with a stereotype-plate having longitudinal grooves in its side edges, and a sectional base thereof, of channelled clamping-strips secured to the column-rule side of the outer sections of said sectional base, the interlocking lower flange of each of said strips being bent at an angle throughout its length near its edge, and embedded in the body of the section, the outer web face of said channelled strip being flush with the side of said section, and the upper flange of said strip extending inwardly, parallel to and above the upper bearing-face of said section, and engaging the groove of the adjacent edge of said plate throughout its length, the upper part of said plate edge being flush with the outer web face of the strip and the side of said section.

3. The combination with a sectional base of a stereotype-plate having longitudinally-grooved side edges, the lower lip of each of said edges projecting a less distance than said upper plate, and a channelled clamping-strip, secured to the column-rule side of the outer sections of said sectional base, the interlocking lower flange of each of said strips being bent at an angle throughout its length near its edge, and embedded in the body of the section, the outer web face of said channelled strip being flush with the side of said section, and the upper flange of said strip extending inwardly, parallel to and above the upper bearing-face of said section, and engaging the groove of the adjacent edge of said plate throughout its length, the upper part of said plate edge being flush with the outer web face of the strip and the side of said section.

702,471. HAND-GUARD AND WRIST-SUPPORTER. GEORGE L. PIERCE, Brooklyn, N. Y., assignor to A. G. Spaulding & Bros., Jersey City, N. J., and New York, N. Y., a Corporation of New Jersey. Filed June 14, 1901. Serial No. 64,081. (No model.)

Claim.—1. The combination in a glove of a hand-guard comprising a layer of protective material secured to the back thereof, and a wrist-supporter comprising a flexible strap secured to the wrist portion thereof.

2. A hand-guard and wrist-supporter comprising a glove having a layer of protective material secured to the back thereof and having the edge portion of the glove turned over the edge of said protective layer and secured to the outside thereof, and a flexible strap secured to the wrist portion of the glove, substantially as described.

3. A hand-guard and wrist-supporter comprising a glove having a layer of protective material secured to the back by sewing and having the edge portion of the glove turned over the edge of said protective layer and secured to the outside thereof by sewing, and a wrist-supporter secured to the wrist portion of the glove by sewing and provided with flex-

ible ends adapted to be wound around the wrist portion of the glove and secured at the back thereof, substantially as described.

702,472. SURGICAL FORCEPS. LOUIS M. PROBOLET, Orange, N. J. Filed Aug. 2, 1898. Serial No. 688,072. (No model.)

Claim.—1. In a pair of surgical forceps, the combination of an electric resistance contained within one of the jaws, a terminal-block on one of the handles, an electric conductor passing from the resistance within the jaw, to and through the said block, said a tube of material impervious to fluids surrounding the said conductor, and having fluid-tight joints with both the interior of the jaw and the interior of the said block.

2. In a pair of surgical forceps, the combination of a hollow jaw, an insulated electric conductor therein extending along the outside of the shank of said forceps, a metallic tube containing said conductor and extending from said hollow jaw to near the end of said conductor along and fastened to the said shank, insulation within the tube and surrounding said conductor, an enlarged end 16, on said conductor out of contact with said metallic tube, and insulation 17, surrounding said conductor and between said tube and said enlarged end.

3. Surgical forceps consisting of the combination of shanks, pivoted together, handles thereon, an electrical resistance carried by one of the jaws and insulated therefrom, a terminal-block 12, attached to one of the handles obliquely to the plane of the handle, a tubular conduit secured in a groove formed along one shank and extending from said jaw to said block, and containing an insulated conductor which is connected to said resistance, the other end of which is electrically connected to the jaw, a terminal 16 for receiving a socket 26 and forming a continuation of said conductor, and a second terminal 15 extending from said block for receiving a socket 25, both of said sockets being adapted to be connected up with a source of electricity.

4. In a pair of surgical forceps, the combination of a hollow jaw having a hole at one end where it joins the shank an insulated electric resistance within the jaw, a metallic conduit hermetically passing through the hole and carrying an insulated electric conductor connected to one end of said resistance, the other end of the resistance being connected to the jaw, a terminal-block upon the handle of the forceps and having a passage-way for said conductor, and hermetically connected to said tube, and a terminal forming the end of said conductor, sealed hermetically within said passage-way, and insulated from said block, the other electric terminal of the forceps being attached electrically to said block, which is connected metallically to said hollow jaw.

5. In a pair of surgical forceps having a hollow jaw, an insulated electric resistance therein, one end being connected hermetically and electrically to the jaw and the other to an electric conductor passing hermetically through and being insulated from said jaw.

6. A pair of surgical forceps consisting of the combination of jaws and handles pivoted together, one of the jaws being provided with a cover applied, to the back of the jaw, an insulating-sheet lying inside of the said jaw, a bare conductor lying on and along the said insulator, a second insulator on said conductor, a tube hermetically connected to the jaw and communicating with its interior, and connected with the same and containing an extension of said conductor, the other end of which is connected electrically with the jaw, as and for the purpose set forth.

7. In a pair of electrical surgical forceps, a terminal-block formed upon a handle thereof, and having a hole extending through the same, lined with an electrical insulating-tube, a tubular electric conductor 16, fitting hermetically within one end of the said insulating-tube, a conduit 8, terminating in hermetical contact with the said terminal-block, and a wire, 9, passing through the said conduit and extending into the said lining, and terminating in the conductor, 16, hermetically and in electric contact therewith.

702,478. BUCKET-DUMPING DEVICE FOR STEAM-SHOVEL. HARRY T. FOSTER and GEORGE H. BRADSHAW, Cleveland, Ohio, assignors of one-third to Willard T. Moore, Cleveland, Ohio. Filed Feb. 6, 1902. Serial No. 98,963. (No model.)

Claim.—1. In a steam-shovel, the combination of a dipper, a movable dipper-arm, tripping mechanism for controlling the discharge of the dipper, and means mounted upon each arm for operating such mechanism.

2. In a steam-shovel, the combination of a dipper, a movable dipper-arm, tripping mechanism for controlling the discharge of the dipper, and a motor cylinder and piston mounted upon each arm connected with and adapted to operate said mechanism.

3. In a steam-shovel, the combination of a dipper, a movable dipper-arm, tripping mechanism for controlling the discharge of the dipper, a motor cylinder and piston mounted upon said arm connected with and adapted to operate said mechanism, and a flexible pneumatic conduit intermediate of said cylinder and the shovel-frame.

4. In a steam-shovel, the combination of a dipper, a movable dipper-arm having said dipper secured thereto so as to be movable substantially about the axis of said arm, a motor cylinder and piston mounted upon the latter, tripping mechanism for controlling the discharge of the dipper, and a flexible connection intermediate of said cylinder and piston, and said tripping mechanism.

702,474. ROTARY ENGINE. JAMES A. FORTER, Crawfordsville, Ind., assignor of two-thirds to Joseph L. Bentley and Edgar Stone, Crawfordsville, Ind. Filed Sept. 12, 1901. Serial No. 75,177. (No model.)

Claim.—In a reversible rotary engine, the combination with a cylinder having opposing steam inlet and exhaust ports, the opposing inlet-ports situated at one end of said cylinder and the exhaust-ports situated on the opposite end of said cylinder and in alignment with their adjacent steam-ports, continuously-rotating steam-distributing valves contiguous to each of said opposing steam-inlet ports, a steam-supplying chamber situated between said steam-distributing valves and a reversing-valve situated between said steam-chamber and each of said distributing-valves, exhaust-valves situated contiguous to said exhaust-ports, and means whereby said steam-reversing valves and said exhaust-valves are all moved si-

multaneously into their respective positions to cause the engine to rotate in either a right or a left hand direction of rotation.

702,475. HARROW. WILLIAM POWERS, Central City, Iowa. Filed Feb. 14, 1902. Serial No. 94,116. (No model.)

Claim.—1. In combination with a plurality of harrow-sections, a brace-bar comprising a plurality of sections, to which the front ends of the harrow-sections are respectively connected, pivot-rods to which the meeting ends of the brace-bar sections are hingedly connected, a draw-bar connected to the said rods, in front of the intermediate section of the brace-bar, and braces secured to the sections of the brace-bar and pivoted on said pivot-rods, substantially as described.

2. In combination with a plurality of harrow-sections, a brace-bar comprising a plurality of sections, to which the front ends of the harrow-sections are respectively connected, pivot-rods, to which the meeting ends of the brace-bar sections are hingedly connected, a draw-bar connected to the said pivot-rods in front of the intermediate section of the brace-bar, brace-straps, secured to the intermediate section of the brace-bar and having their outer ends pivoted on the pivot-rods and bearing against the rear side of the draw-bar, and brace-rods, pivoted on the said pivot-

rods, extending outwardly, and connected to the outer harrow-sections, substantially as described.

3. In combination with a plurality of harrow-sections, a brace-bar comprising a plurality of sections, to which the front ends of the harrow-sections are respectively connected, pivot-rods to which the meeting ends of the brace-bar sections are hingedly connected, a draw-bar connected to the said pivot-rods in front of the intermediate section of the brace-bar, brace-straps, secured to the intermediate section of the brace-bar and having their outer ends pivoted on the pivot-rods and bearing against the rear side of the draw-bar, brace-rods pivoted on said pivot-rods and connected to the outer harrow-sections, and a draft element, in front of the draw-bar and having its ends connected to the front portions of the pivot-rods, substantially as described.

702,476. SHOE-PROTECTOR. JAMES M. PRICE, New Rockford, N. D. Filed Jan. 7, 1902. Serial No. 93,790. (No model.)

Claim.—1. A shoe-protector comprising a plate having upturned and slotted ends and having a downturned side edge to lie against the front face of a shoe-heel, a strap engaged through one of the slots and passed loosely through the other slot, and a buckle adjacent to the engaged end of the strap and adapted to receive the free end of the strap.

2. A shoe-protector comprising a plate adapted to lie against the under side of the instep of a shoe and having upturned ends having horizontally-extending slots, a strap engaged through one of the slots and passed loosely through the other slot to lie in a horizontal plane, and a buckle attached to the strap adjacent to its engaged end and adapted to receive the free end of the strap and hold it in a vertical plane, the rear edge of the plate being bent downwardly to lie against the front face of the shoe-heel.

702,477. GAME OR PUZZLE. JOHN POTTER, Cornell, Pa. Filed June 14, 1901. Serial No. 64,518. (No model.)

Claim.—1. A game or puzzle consisting of an open, shallow box, the bottom thereof provided with series of rows of cavities, separated by ridges, and a marginal rim around said box, in combination with a cover adapted to close over said box, together with a series of movable balls or the like, adapted to said cavities, and extended upward, when in said cavities, above the same, and said cover adapted to prevent said balls or the like from being shifted from one cavity to another when said cover is down in place, and means for detachably maintaining said cover in said position, substantially as and for the purposes described.

2. The combination of shallow box having rows of cavities, A' A', arranged in equal series in a square, a marginal rim, A', around said cavities, supporting-foots, A' A', movable balls, B B, and detachable cover, C C', constructed to rest upon said rim, and said balls, and prevent escape of said balls from said cavities, the whole constructed and arranged substantially as and for the purposes described.

702,478. WATER-GUN. CHARLES E. RADSHAW, Elgin, Ill. Filed Dec. 19, 1901. Serial No. 94,481. (No model.)

Claim.—1. A toy or device for use in initiating candidates into lodges, secret societies and other like organizations, consisting of a gun-stock, a gun-barrel mounted upon said stock, a trigger, said barrel being adapted to contain water or other fluid and having a rear discharge-opening, ejecting mechanism for ejecting water or other fluid through said discharge-opening, and a locking device for locking the ejecting mechanism in position to eject the water, said locking device being connected with and operated by the said trigger.

2. A toy or device for the purpose described, consisting of a device having substantially the shape and appearance of an ordinary gun, the same being provided with a rear discharge-opening and also with a chamber for water or other fluid, ejecting device for ejecting the water or

other fluid through said discharge-opening, and a trigger for releasing said ejecting device and thereby discharging the water into the face of the operator.

3. A toy or device for the purpose described, consisting of a device having the shape and appearance of an ordinary gun, the same being provided with a rear discharge-opening, ejecting device for ejecting any desired substance or fluid through said discharge-opening, and a trigger for releasing said ejecting device.

4. A toy water-gun for use in the manner described, comprising a gun-stock, a gun-barrel, said gun-barrel being constructed with a water-chamber and also a rear discharge-opening, a spring-pressed plunger inclosed by said barrel and adapted for ejecting the water through said discharge-opening, and trigger mechanism for holding said plunger in position to eject the water.

5. A toy or the like for the purpose described, consisting of a device in the nature of and having substantially the shape and appearance of a gun, the rear end of the gun-barrel being provided with a discharge-opening, a water-chamber in said gun, a spring-pressed plunger inclosed by said gun-barrel and adapted to eject water through said discharge-opening, trigger mechanism for releasing said plunger, and a valve device operated by said trigger and adapted to control said discharge-opening.

6. In a toy device of the character and for the purpose specified, the combination of a gun-stock, a gun-barrel, said gun-barrel being provided with a rear discharge-opening and a water-chamber, a spring-pressed plunger inclosed by said gun-barrel and adapted to eject the water through said discharge-opening, a trigger device for releasing said plunger, a reciprocating valve held normally seated by a spring and adapted to control said discharge-opening, and a locking-bolt operated by said trigger device and adapted for releasing said valve, the trigger thereby operating to simultaneously release said plunger and open said discharge-opening.

7. A toy for use in initiating candidates into lodges, secret societies and like fraternal organizations, consisting of a device having substantially the shape and appearance of a firearm, the same being constructed with a water-chamber and a rear discharge-opening adapted to direct the discharge into the face of the operator, ejecting mechanism for forcing the water through said discharge-opening, and a trigger device for releasing said ejecting mechanism at the moment when the usual discharge or report is expected from the fire-arm.

702,479. MAIL-BOX. JAMES M. RADSHAW, Matthews, Ind. Filed Jan. 7, 1902. Serial No. 93,772. (No model.)

Claim.—1. A mail-box comprising a body divided into three compartments each having means for depositing matter therein from the exterior, the one side of the box being primarily left fully open to give access to the compartments, a door hinged at its lower edge to the bottom of the side of the box primarily left open and adapted to close said side,

trays slidingly mounted in the end compartment and horizontally disposed to receive the matter deposited in said compartments, and connecting devices between opposite ends of the door and the said trays, whereby the latter will be moved outwardly and inwardly simultaneously with the corresponding movement of the door.

2. A mail-box comprising a body divided into three compartments with slides leading thereto from the exterior, supplemental bottoms in the end compartments, a slide on one of the said supplemental bottoms carrying a tray having its opposite side portions closely bearing against the side walls of its compartment, a tray slidingly mounted on the other supplemental bottom and provided with a directing-enlargement at the rear, a drop-door hinged to the body, and connecting means between the movable parts in the end compartments and the said door whereby said movable parts will be drawn outwardly from and moved inwardly into their compartments simultaneously with the opening and closing movements of the door.

3. A mail-box having a money-receiving compartment at one end, a supplemental bottom in the said compartment, a tray slidingly mounted on the supplemental bottom and provided with a directing-enlargement at the rear end that inclines at the front downwardly toward the tray, the said tray being at all times maintained in a true horizontal position in its movement over the supplemental bottom, a drop-door hinged to one side of the box to expose the said compartment, and connecting means between the tray and the door whereby said tray will be drawn outwardly from and pushed inwardly into the box simultaneously with the opening and closing movements of the door.

4. A mail-box having an end compartment with a supplemental bottom therein, a door hinged over one side of the box, a slide mounted on the supplemental bottom and carrying a tray consisting of a sheet-metal strip upturned at the opposite side portions and closely bearing against the side walls of the said compartment, and means between the said slide and door for causing the slide and tray to open and close simultaneously with the corresponding movements of the door.

5. A mail-box having a letter-compartment accessible by means of a slide in one of the walls thereof, a hinged door for said compartment, a slide vertically movable over the said slot and having an upper laterally-projecting head, and means between the said slide and door for moving the slide simultaneously with the door.

702,480. STORM-CURTAIN FOR VEHICLES. EDWARD REEBER, Butler, Pa. Filed Dec. 7, 1901. Serial No. 96,986. (No model.)

Claim.—1. In a storm-curtain for buggies or carriages, the combination of the curtain A, braces B fixed crosswise on the same and the upright brace C two or more in number, having the two parts C each end of the connecting parts C' and the cleaves c, substantially as described and shown.

2. In a storm-curtain for carriages, the brace C, having at the upper

end the hooked extension c' and spring c' to attach to the buggy-top, and the forked extension c' with spring c' to attach the curtain to the dashboard; and the brace B terminating in hooks b to attach the curtain to the uprights of the buggy-top; all combined and arranged, substantially as described and shown.

702,481. FIRE-MASK. JAMES R. REID, Gloversville, N. Y., assignor of two-thirds to J. Leobenheim & Son, Gloversville, N. Y., a firm. Filed Sept. 28, 1901. Serial No. 76,928. (No model.)

Claim.—1. A fire-mask, comprising a flexible inclosure, containing filtering material, open to the atmosphere at or near its outer edges to admit smoke and air, and near its central portion to admit the nostrils of the wearer, and having eye-apertures there-through, closed at their outer ends to the atmosphere by a transparent covering impervious to the smoke, and means for securing the inclosure upon the face of the wearer.

2. A fire-mask, comprising a flexible inclosure, containing filtering material, open to the atmosphere at or near its outer edges to admit smoke and air, and near its central portion to admit the nostrils of the wearer, and having an eye-aperture there-through, closed to the filtering-chamber by a tube and to the atmosphere at their outer ends by a transparent covering, and means for securing the inclosure upon the face of the wearer.

3. A fire-mask, comprising a concavo-convex inclosure, containing filtering material, open to the atmosphere at or near its outer edges to admit smoke and air, and near its central portion to admit the nostrils of the wearer, means for admitting visual rays to the eyes, and means for securing the inclosure upon the face of the wearer.

4. A fire-mask inclosure comprising two sheets of material secured together around their outer edges, containing filtering material integral with one of each sheet, open to the atmosphere at or near its outer edges to admit smoke and air, and near its central portion to admit the nostrils of the wearer, means for admitting visual rays to the eyes, and means for securing the inclosure upon the face of the wearer.

5. A fire-mask inclosure, open to the atmosphere at or near its outer edges to admit smoke and air, and near its central portion to admit the nostrils of the wearer, having one of its side walls composed of animal integument dressed with its dermal appendages which project from its inner side and are adapted to approximately fill the inclosure, and means for securing the inclosure upon the face of the wearer.

702,482. MACHINE FOR FILLING AND WRAPPING POWDERS. FRANK A. ROBINSON, Auburn, N. Y., assignor to MATTIE LARY, New York, N. Y. Filed Jan. 13, 1902. Serial No. 96,981. (No model.)

Claim.—1. In a machine for feeding and wrapping powders, a conduit having an outlet, and an automatic means including a closure to intermittently close and open the outlet, a rotary screw-feed, and an expandable helices carried by the screw.

2. In a machine for feeding and wrapping powders, an upright conduit having an outlet, and an intermittently-moving feed comprising a screw having expandable helices, and a closure carried by said screw and movable across the outlet to open and close the same.

3. In a machine for feeding and wrapping powders, a conduit having an outlet, and a rotary screw-feed having a closure movable across the opening for the purpose specified.

4. In a machine for feeding and wrapping powders, a conduit having an outlet, and a screw-feed carrying a closure intermittently opening and closing the outlet.

5. In a machine for feeding and wrapping powders, a conduit having an outlet, and a rotary screw-feed having a closure between adjacent helices for the purpose specified.

6. In a machine for feeding and wrapping powders, a conduit having an outlet, a rotary screw-feed having expandable helices, and a closure carried by the screw for the purpose specified.

7. In a machine for feeding and wrapping powders, a conduit having an outlet, a rotary screw-feed having expandable helices, and a closure secured to the periphery of one of the helices and movable across the outlet.

8. In a machine for feeding and wrapping powders, a conduit having an outlet, a revolving stem carrying a closure for the outlet, and an expandable spiral blade mounted on the stem.

9. In a machine for feeding and wrapping powders, a hopper having an outlet, an intermittently-rotating spiral blade, a closure carried by the lower end of said blade and movable across the outlet for intermittently opening and closing said outlet, and a curved agitator-arm carried by the upper end of said spiral blade, substantially as described.

10. In a machine for feeding and wrapping powders, a rotary spiral blade and an inclosure therefor having a discharge-opening, in combination with a closure for the opening revolving with the blade, and means to rotate the blade one revolution at regular predetermined intervals.

11. In a machine for feeding and wrapping powder, a screw having an axially-movable helix, and an additional helix fixed from axial movement and provided with a gate or closure for the purpose set forth.

12. In a machine for feeding and wrapping powder, a screw comprising a fixed helix and an expandable spiral blade, a gate or closure on the fixed helix, and a single operating member for expanding the helices of the spiral blade.

13. In a machine for feeding and wrapping powder, a conduit having a discharge-opening, a rotary spiral blade having its helices provided with nuts, a stem having different threads engaged with the nuts, and a gate rotating with the blade across the opening.

14. In a machine for feeding and wrapping powder, a conduit having a discharge-opening, a rotary spiral blade having its helices provided with nuts, a stem having different threads engaged with the nuts, a lock-nut engaged with the threaded stem, and a gate rotating with the blade across the opening.

15. A feeding device for powder-wrapping machines comprising a chamber one discharging into the other, the latter chamber having a discharge-opening, and a screw-feed in each chamber, one being movable intermittently and provided with a gate or closure for the opening.

16. A feeding device for powder-wrapping machines comprising a vertical hopper, a screw-feed in the hopper, a horizontal chamber discharging into the hopper, a screw in said chamber, a receptacle discharging into the chamber, a screw between the receptacle and chamber, and an agitator in the receptacle movable across the screw.

17. A feeding device for powder-wrapping machines comprising a vertical hopper, a screw-feed in the hopper, a horizontal chamber discharging into the hopper, a screw in said chamber, a receptacle discharging into the chamber, a screw between the receptacle and chamber, and a rotary feed and agitator in the receptacle for the purpose set forth.

18. A feeding device for powder-wrapping machines, comprising a receptacle, a subchamber and a vertical hopper discharging respectively from one to the other, the hopper being arranged at right angles with the subchamber and having a discharge-opening, an intermittently-operated

screw-feed in the hopper and provided with a closure for the opening, a feeding device in the receptacle, and a prime mover connected to said feeding device and screw-feed.

19. A feeding device for powder-wrapping machines, comprising a receptacle, a subchamber, and a hopper discharging respectively from one to the other, the hopper being arranged at an angle with the subchamber and having a discharge-opening, an intermittently-moving feeding device in the hopper, a gate or closure carried thereby for the discharge-opening, feeding devices in the receptacle and subchamber, and a prime mover connected to the feeding devices for imparting continuous movement to those in the receptacle and subchamber and intermittent movement to the feed in the hopper.

20. A feeding device for powder-wrapping machines, comprising a receptacle, subchamber and a hopper discharging respectively from one to the other, the hopper being arranged at an angle with the subchamber, a prime mover, feeding devices in the receptacle and subchamber actuated by the prime mover, and an expandable spiral blade in the hopper actuated intermittently by the prime mover.

21. A feeding device for powder-wrapping machines, comprising an upright conduit having a discharge-opening, a rotary expandable spiral blade in the conduit moving intermittently one revolution at a time, a closure for the opening moving with said blade, means for expanding and holding the spiral blade in its adjusted position, and additional means for feeding the powder to said spiral blade.

22. A wrapping and folding mechanism for powders, comprising a former, a moving frame having means to draw the wrapper through the former, automatic means on the frame for separating the wrappers and folding their ends toward each other, and additional means for interlocking one end of the wrapper in the fold of the other end.

23. A wrapping and folding mechanism for powders, comprising a former, a rotary head having means to draw the wrappers from the former, end-folding gates carried by the head, one of which is arranged to separate the wrappers, means for folding the ends of the wrapper, and means operated by one of the gates to interlock one end of the wrapper in the fold of the other.

24. A wrapping and folding mechanism for powders, comprising a former and mechanism to draw the wrappers through the former and fold the same and to simultaneously separate the wrappers and interlock one end in the fold of the other end.

25. A wrapping and folding mechanism for powders, comprising a former, and automatically-operating mechanism to draw the wrappers from the former and fold the same and to simultaneously separate and interlock the ends of the wrapper with each other without interruption in the operation of said mechanism.

26. A wrapping and folding mechanism, comprising a former, a continuously-rotating head having means to draw the wrappers from the former, an end-folding gate for separating the wrappers, means for folding the wrappers, and means for interlocking one end in the fold of the other end, substantially as described.

27. A wrapping and folding mechanism comprising a former, a rotary head, a gripper carried by the head to engage and hold the wrapper, a cam for actuating the gripper, end-folding gates carried by the head, one of said gates arranged to separate the wrappers, means to close the gates independently of each other, and means operated by one of the gates to interlock one end of the wrapper in the fold of the other.

28. A wrapper and folding mechanism comprising a former, a continuously-rotating head, a gripper carried by the head to engage and fold the wrapper, a cam operating the gripper, end-folding gates on the head, one of said gates arranged to separate the wrappers, means operated by one of the gates to interlock one end of the wrapper in the fold of the other, and means to close the gates one in advance of the other.

29. A wrapping and folding mechanism, including a former, a rotary head, a gripper carried by the head, means to operate the gripper, gates mounted on the head to fold the ends of the wrapper, and additional means for interlocking the ends of the wrapper with each other.

30. A machine for filling, wrapping and folding powders comprising an upright conduit and a horizontal chamber and a rotary screw-feed in each, one screw having a spiral blade expandable axially, means to expand the helices of the spiral simultaneously, a former for supporting the wrapper material at the discharge-opening of the upright conduit, a rotary head having grippers to engage and draw the wrapper through the former, and mechanism carried by the head for folding and interlocking the ends of the wrappers.

31. A machine for filling, wrapping and folding powders comprising a former, an upright conduit, an intermittently-rotating spiral blade, a fixed former for the wrapper, and a rotary head carrying mechanism to separate the wrappers and to fold their ends inwardly, and automatic means on said head to interlock one end of the wrapper with the other end as the head is rotated.

702,488. RADIATOR. CHARLES W. ROSE, Chicago, Ill., assignor of sixty-nine one-hundredths to Julian W. Mathis, Eugene Worthing, and Crampton L. Linley, Chicago, Ill. Filed Jan. 22, 1900. Serial No. 2,332. (No model.)

Claim.—1. A radiator consisting of a body or tubular portion and headers, the body or tubular portion embracing, as a unit, a plurality of tubes, and having the entire series of body-tubes with the headers made from two companion plate halves or sections, each stamped or pressed into shape to form a multiplicity of straight-line body depressions, with the body depressions of one plate half or section in alignment with and parallel with the body depressions of the companion plate half or section, the two series of body depressions running in straight lines across the plate halves or sections and to form on two opposite sides edge depressions with the edge depressions of one plate half or section in alignment with and parallel with the edge depressions of the companion plate half or section, the two sets of edge depressions running in a straight line and in a right-angle relation to the body depressions and intersecting the ends of the body depressions, each body depression constituting one-half of a straight-line body-tube and each edge depression constituting one-half of the straight-line header integral with the half-tubes of the body, and to form edge flanges on the sides and ends of the plate halves or sections and interior contact-faces on the sides of the body-tubes, for the two plate halves or sections to be joined together by uniting the flanges and contact-faces, substantially as described.

2. A radiator consisting of a body or tubular portion and headers, the body or tubular portion embracing, as a unit, a plurality of tubes, and having the entire series of body-tubes with the headers made from two companion plate halves or sections, each stamped or pressed into shape to form a multiplicity of straight-line body depressions, with the body depressions of one plate half or section in alignment with and parallel with the body depressions of the companion plate half or section, the two series of body depressions running in straight lines across the plate halves or sections and to form on two opposite sides edge depressions with the edge depressions of one plate half or section in alignment with and parallel with the edge depressions of the companion plate half or section, the two sets of edge depressions running in a straight line and in a right-angle relation to the body depressions and intersecting the ends of the body depressions, each body depression constituting one-half of a straight-line body-tube and each edge depression constituting one-half of a straight-line header integral with the half-tubes of the body, and to form edge flanges on the sides and ends of the plate halves or sections and interior contact-faces on the sides of the body-tubes, for the two plate halves or sections to be joined together by uniting the flange and contact-faces, and a reinforcement or thimble at each end of each header, substantially as described.

703,484. CAR-FENDER. WILLIAM B. ROSE, Bay St. Louis, Miss. Filed Nov. 30, 1901. Serial No. 84,362. (No model.)

Claim.—1. In a car-fender, the combination with a downwardly-movable catch member, of a support for normally holding the catch member in elevated position, said support comprising a slidably-mounted section, and a trip-section hinged to the slidably-mounted section and having a detachable engagement with the catch member to normally support the same.

2. In a car-fender, the combination with a downwardly-movable catch member, of a support for normally holding the catch member in elevated position, said support comprising a slidably-mounted section, a trip-section hinged to the slidably-mounted section and having a detachable engagement with the catch member to normally support the same, and a spring carried by one section and engaging the other to automatically elevate the trip-section when it is detached from the catch member.

able engagement with the catch member to normally support the same, and a spring carried by one section and engaging the other to automatically elevate the trip-section when it is detached from the catch member.

3. In a car-fender, the combination with a downwardly-movable catch member, of a support for normally holding the catch member in elevated position, said support comprising a slidably-mounted section, a trip-section hinged intermediate its ends to the slidably-mounted section and having a detachable engagement with the catch member to normally support the same, and a spring carried by the slidably-mounted section and engaging the inner end of the trip-section to automatically elevate the latter when it is detached from the catch member.

4. In a car-fender, the combination with a downwardly-movable catch member, of a support for normally holding the catch member in elevated position, said support comprising a box provided with spaced sets of rollers, a section slidably mounted at its inner end between the sets of rollers and having its outer end bifurcated, a trip-section hinged intermediate its ends in the bifurcated end of the slidable section and having a detachable engagement with the catch member to normally support the same, and a spring carried by the slidable member and bearing upon the inner end of the trip-section to elevate the same when it is detached from the catch member.

5. In a car-fender, the combination with a fastening-plate arranged to be secured to the front portion of a car, of a downwardly-movable catch member hinged to the plate, a spring carried by the plate and bearing upon the catch member to move the latter downwardly, and an upwardly-swinging rearwardly-movable support having a portion extending in front of the catch member, said support having a detachable engagement with the catch member.

6. In a car-fender, the combination with a fastening-plate arranged to be secured to the front portion of a car, of a downwardly-movable catch member hinged to the plate, a spring carried by the plate and bearing upon the catch member to move the latter downwardly, and an upwardly-swinging rearwardly-movable support comprising bearings mounted upon the ends of the fastening-plate, sections slidably mounted in the bearings, a trip-section extending around in front of the catch member and hinged to the slidable section, said trip-section carrying rollers that detachably engage the catch member, and springs mounted upon the slidable sections and bearing against the trip-section to elevate the latter when detached from the catch member.

702,485. BED-BOTTOM. PATRICK R. ROBERT, New York, N. Y. Filed Feb. 1, 1902. Serial No. 25,181. (No model.)

Claim.—1. In a bed-bottom, the combination of a frame, a fabric

connected thereto, and a fabric-support comprising looped cables connected in pairs to opposite bars of the frame and arranged so that the inner legs of each pair intersect each other, a connection between the intersecting portions of one pair of the cables and the intersecting portions of the other pair, and connections between the heights of the cables of one pair and the heights of the corresponding cables of the other pair.

2. In a bed-bottom, the combination of a frame, a fabric connected thereto, and a fabric-support comprising looped cables connected at their ends in pairs to opposite bars of the frame and arranged so that the inner legs of each pair intersect each other, a connection between the intersecting portions of one pair of the cables and the intersecting portions of the other pair, and coiled springs connecting the heights of the cables of one pair and the heights of the corresponding cables of the other pair.

702,486. SEEDING-MACHINE. JONATHAN H. SANDER, Moline, Ill., assignor to D. H. Seidler Carriage Company, Moline, Ill., a Corporation of Illinois. Filed Nov. 1, 1901. Serial No. 22,722. (No model.)

Claim.—1. The combination of a seed-plate shaft, driving mechanism, clutch mechanism for connecting said seed-plate shaft with said driving mechanism, a rock-shaft, a throw-out device mounted on and rigidly connected to said rock-shaft for operating said clutch mechanism to disconnect said seed-plate shaft from said driving mechanism, and a spring for normally holding said throw-out device in operative position, substantially as described.

vice mounted on and rigidly connected to said rock-shaft for operating said clutch mechanism to disconnect said seed-plate shaft from said driving mechanism, substantially as described.

2. The combination of a seed-plate shaft, driving mechanism, clutch members adapted to connect said seed-plate shaft with said driving mechanism for rotating said shaft, a rock-shaft, and a throw-out arm rigidly connected to said shaft and normally lying in position to hold said clutch members out of engagement, and being moved by the rocking of said rock-shaft to permit said clutch members to engage, substantially as described.

3. The combination of a seed-plate shaft, driving mechanism, clutch mechanism for connecting said seed-plate shaft with said driving mechanism for rotating said shaft, a rock-shaft, a throw-out device mounted on and connected to said rock-shaft for operating said clutch mechanism to disconnect said seed-plate shaft from said driving mechanism, and a spring for normally holding said throw-out device in operative position, substantially as described.

4. The combination of a seed-plate shaft, driving mechanism, clutch mechanism for connecting said seed-plate shaft with said driving mechanism for rotating said shaft, a rock-shaft, a throw-out device mounted on and rigidly connected to said rock-shaft for operating said clutch mechanism to disconnect said seed-plate shaft from said driving mechanism, a check-row-wire-operated lever for rocking said rock-shaft, and a spring for normally holding said throw-out device and said check-row-wire-operated lever in operative position, substantially as described.

5. The combination of a seed-plate shaft, driving mechanism, clutch members adapted to connect said seed-plate shaft with said driving mechanism for rotating said shaft, a rock-shaft, a throw-out arm rigidly connected to said shaft and normally lying in position to hold said clutch members out of engagement, and being moved by the rocking of said rock-shaft to permit said clutch members to engage, a check-row-wire-operated lever for operating said rock-shaft, and a spring for normally holding said lever and said throw-out arm in operative position, substantially as described.

6. In a corn-planter, the combination of driving-wheel, a seed-plate shaft, a clutch member carried by said shaft and adapted to rotate independently thereof, means connecting said clutch member with the carrying-wheel, whereby it will rotate by the forward movement of the planter, a clutch member carried by said seed-plate shaft and fixedly secured thereto, said clutch member being adapted to engage said first-mentioned clutch member for rotating said shaft, a rock-shaft, a throw-out device mounted on and rigidly secured to said shaft, said throw-out arm being adapted to disconnect said clutch members when in its normal position, a spring for holding said throw-out device in its normal position, and a check-row-wire-operated lever for rocking said shaft to move said throw-out device out of its operative position, substantially as described.

7. The combination of a seed-plate shaft, a clutch composed of a ratchet-wheel and a pawl, one of said clutch members being rigidly connected to said shaft so as to rotate therewith, means operated by the forward movement of the machine for rotating the other clutch member, and throw-out mechanism for disconnecting said clutch members, consisting of a rock-shaft, a throw-out arm rigidly mounted thereon, and means for rocking said shaft, substantially as described.

8. The combination of a seed-plate shaft, a clutch composed of a ratchet-wheel and a pawl, one of said clutch members being rigidly connected to said shaft so as to rotate therewith, means operated by the forward movement of the machine for rotating the other clutch member, throw-out mechanism for disconnecting said clutch members, consisting of a rock-shaft, a throw-out arm rigidly mounted thereon, means for rocking said shaft, and a spring normally holding said throw-out arm in operative position, substantially as described.

9. The combination of a seed-plate shaft, a clutch composed of a ratchet-wheel and a pawl, one of said clutch members being rigidly connected to said shaft so as to rotate therewith, means operated by the forward movement of the machine for rotating the other clutch member, throw-out mechanism for disconnecting said clutch members, consisting of a rock-shaft, a throw-out arm rigidly mounted thereon, a lever for rocking said shaft, and a spring normally holding said rock-shaft and lever in operative position, substantially as described.

10. The combination of a seed-plate shaft, a clutch composed of a wheel having ratchet-teeth on its periphery and a pawl adapted to engage said ratchet-teeth, one of said clutch members being rigidly connected to said shaft so as to rotate therewith, means operated by the forward movement of the machine for rotating the other clutch member, and throw-out mechanism for disconnecting said clutch members at intervals, substantially as described.

11. The combination of a seed-plate shaft, a clutch composed of a wheel having ratchet-teeth on its periphery and a pawl adapted to engage said ratchet-teeth, one of said clutch members being rigidly connected to said shaft so as to rotate therewith, means operated by the forward movement of the machine for rotating the other clutch member, and throw-out mechanism for disconnecting said clutch members at intervals, substantially as described.

plates, and for definitely positioning and holding said frame in relation to any desired plates of said series, substantially as described.

2. In combination with an extended table, plates disposed thereon at different points, rails extending longitudinally in front of and in rear of the plates, a type-writer having a rectangular under frame; antifrictional means adapted to each frame for running on said rails; and means whereby a type-writer may be definitely located and held in proper position in relation to the desired plates, the said rails serving to support and guide the type-writer in its movement along the said table, substantially as described.

3. In combination, an extended table, plates disposed thereon at different points; rails running longitudinally in front of and in rear of said plates; a type-writer having a rectangular under frame; means supporting said type-writer frame and adapted to run on the said rails; and means for definitely positioning and holding the said type-writer frame in relation to the desired plates, substantially as described.

4. In combination an extended table; plates fixed thereon at different points; rails extending longitudinally in front of and in rear of the said plates; a type-writer having a rectangular under frame; means upon which the said type-writer frame is supported, to move easily on the rails; and slots in the said table extending at right angles to the rails, and having inclined bottoms, whereby the said type-writer frame will be definitely located and held in proper position to the desired plates, substantially as described.

5. A type-writer table having a plurality of plates disposed at different points; a type-writer having a rectangular under frame; supports under said frame adapted to permit movement of frame easily in any direction; means for guiding the type-writer frame when moved longitudinally to the table; and means for positioning and holding the said type-writer frame in relation to the plates when the type-writer frame is moved transversely to the table, substantially as described.

702,494. STAMP-CANCELING MACHINE. GEORGE R. SHAW, Worcester, Mass. Filed July 24, 1900. Serial No. 24,887. (No model.)

Claim.—1. In a stamp-canceling machine, a feeding mechanism comprising a compressible holder provided with a plurality of air-chambers each having an open mouth, the several mouths opening within the area of the letter to be fed, a carrier for said holder, means by which the holder may be compressed to discharge the air from its chambers whereby it will when expanded, operate to hold by atmospheric pressure a letter fed against its open mouth, and means for compressing the holder to cause it to release the letter so held substantially as set forth.

2. A stamp-canceling machine provided with a letter-feeding mechanism comprising a carrier composed of front and rear hand-wheels, an endless feeding-band thereon, and a section-holder secured thereto, and means for operating said holder whereby it is caused to secure and release the letter, and guides whereby the letter-holder is directed in a straight line between the point where it receives the letter and the canceling device, substantially as set forth.

3. In a stamp-canceling machine, the combination of the front and rear hand-wheels, the endless feeding-band, and a compressible holder carried by the band and having a plurality of independent chambers with their mouths opening independently whereby the holder will operate to secure the letter at different points, substantially as set forth.

4. In a stamp-canceling machine, a compressible holder provided with an air-chamber having an open mouth and having adjacent to said mouth a flat face to fit against the letter and a projecting head or nipple surrounding said mouth, substantially as set forth.

5. A stamp-canceling machine comprising a carrier and a compressible holder provided with a plurality of independent chambers having open mouths arranged in longitudinal and lateral series, substantially as set forth.

6. In a stamp-canceling machine, the combination of a compressible holder provided with an air-chamber having an open mouth against which the letter may be held by atmospheric pressure, and with a spring-holding chamber with a spring operating in said chamber by which to expand the holder to open the air-chamber, and a double-winged plate receiving said spring, substantially as set forth.

7. In a stamp-canceling machine, a compressible holder of resilient material provided with an air-chamber having an open mouth and with a spring-holding chamber and a series of independent springs operating in each chamber by which to expand said holder, substantially as set forth.

8. In a stamp-canceling machine, the combination of a compressible holder provided with an air-chamber having an open mouth and with a recess, and a spring in said recess to open or expand the holder, substantially as set forth.

9. In a stamp-canceling machine, a letter-feeding mechanism comprising a carrying-band; and a compressible holder carried thereby and provided with an air-chamber projecting beyond the rear face of the band and having an open mouth at the front or outer side of the band, substantially as set forth.

10. In a stamp-canceling machine, a letter-feeding mechanism comprising a carrying band or plate having a plurality of openings, and an expandable holder having a plurality of air-chambers whose mouths are open and are surrounded by projecting nipples, said holder being secured on one side of the band or plate with its nipples projecting through the openings thereof and protruding beyond the opposite side of the band or plate, substantially as set forth.

11. In a stamp-canceling machine, a letter-feeding mechanism, comprising the carrier band or plate having an opening for the nipple of the air-chamber of the holder, the compressible holder provided with the nipple fitted in said opening and secured at one face to the band or belt and having in said face an air-chamber whose mouth coincides with the opening in said band and also having in said face a recess for the expanding-spring, and the expanding-spring fitted in said recess and operating between the band or plate and the holder to open or expand the holder, substantially as set forth.

12. In a stamp-canceling machine, a letter-feeding mechanism comprising the endless carrier, the compressible letter-holder carried thereby and provided with an air-chamber projecting normally from the rear face of the band and having an open mouth, and the driving and supporting pulleys around which said carrier is passed and arranged to operate upon the air-chambers substantially as set forth.

13. In a stamp-canceling machine, the letter-feeding mechanism comprising the drive-pulley having the drum portion and the sprocket-wheel above and below the same, the carrier band or belt, the compressible holder thereon having an air-chamber, and the guide-pulleys co-operating with the drive-pulley in supporting the carrier, substantially as set forth.

14. In a stamp-canceling machine the combination of the pulleys supporting the carrier, the carrier having a band or plate passed around said pulleys, and the compressible holders secured to the inner side of said band or plate, substantially as set forth.

15. In a stamp-canceling machine, the combination of the letter-feeding mechanism consisting of an endless carrier having compressible letter-holding devices and guides for directing said carrier and for compressing the holding devices, and the canceling device operating along-side one edge of the said carrier, substantially as set forth.

16. In a stamp-canceling machine, the combination of the canceling device, a carrier movable past said canceling device and provided with a compressible holder provided with a series of independent chambers whose mouths open within the area of the letter to be fed and arranged to secure the letter by the action of atmospheric pressure and means in advance and rear of the canceling device by which to compress the holder whereby to provide for securing the letter by atmospheric pressure in advance of the canceling device and for releasing it in rear of said device, substantially as set forth.

17. In a stamp-canceling machine, the combination of a base-disk having on its periphery one portion of the cancellation device and one or

more lines of characters designating the postal station, a crown-disk concentric with and connected with the base-disk, an eccentrically-located stud, an intermediate disk rotatable on said stud and having on its periphery a series of characters representing the usual subdivisions of a day and so positioned that at all times one of the said series shall extend outwardly and register with the line or lines of characters on the base, a locking-plate having in its periphery a series of cavities and on its upper side a series of pins, the said cavities and pins being of the same number as the subdivisions of the intermediate disk, a pin for securing the locking-plate to the intermediate disk, and a stud rotatable in the crown-disk and having cross-arms adapted to mesh with and transmit motion to the pins of the locking-plate and also having a portion adapted to engage with the peripheral concavities of the said locking-plate and hold the same except at such times as the said arms and pins are in operative contact substantially as shown and described.

18. In a stamp-canceling machine, the canceling and doing wheel comprising the base-disk, the cap-disk fitted on and held to the base-disk, the time-disk between and concentric to the base and cap disks and provided with a wheel having peripheral notches and pins or spurs projecting from its face, and the piston having a wheel notched to mesh with the said peripheral notches and having lateral pins to mesh with the faces of the said wheel substantially as set forth.

19. In a stamp-canceling machine, the canceling-wheel comprising the base-disk, the cap-disk concentric with and secured to the base-disk, provided in its inner face with a central, main circular recess and with a circular recess lateral to and communicating with the main recess, the time-disk between and concentric to the base and cap disks, the wheel held to said time-disk and fitted in the main recess of the cap-disk and the shaft journaled in the cap-disk and provided with a wheel fitted in the lateral recess in the cap-disk and meshed with the wheel in the main recess, substantially as set forth.

20. In a stamp-canceling machine the canceling-wheel comprising the base-disk, the cap-disk, the time-disk between the base and cap disks, the pin extended between the base and cap disks and the screw device for clamping the base and cap disks together and upon the time-disk, substantially as set forth.

21. In a stamp-canceling machine, the combination of a canceling-wheel, a letter-feeding device having an endless carrier movable in an uninterrupted straight line past the face of the canceling-wheel adjacent to the periphery thereof and provided with a plurality of letter-holding devices, a letter-guide normally impinging the face of the carrier, opposite and above the cancellation-wheel, and a positively-driven resilient drum inflexibly mounted opposite the said cancellation-wheel.

22. A stamp-canceling machine provided with a letter-feeding mechanism comprising an endless carrier-band and a holder thereon arranged to secure the letter by the action of atmospheric pressure, means for expanding and contracting said holder whereby it is caused to secure and release the letter, and guides whereby the letter-holder is directed in a straight line between the point where it receives the letter and the canceling device.

23. A stamp-canceling machine comprising a letter-feeding mechanism composed of an endless carrier-band, a section-holder secured thereto, supporting and operating devices for the carrier, and means for positively expanding and contracting the section-holder substantially as set forth.

24. In a stamp-canceling machine, the combination of a compressible section-holder, an endless carrier to which said holder is secured, means carried by the holder by which it may be expanded and means independent of the holder for compressing the same substantially as set forth.

702,495. FILTER. DELLA R. SMITH, Brooklyn, N. Y. Filed Dec. 31, 1901. Serial No. 87,986. (No model.)

Claim.—As an article of manufacture, a filter comprising a glass body portion having reduced, cylindrical, tubular ends having threads pressed thereon, a sheet-metal sleeve for each tubular end comprising a major portion, a minor portion and an intermediate shoulder, said major and minor portions having threads pressed therein the major portions of the sleeves being screwed onto the reduced portions of the body, a pair of rubber washers, disposed between the end of each reduced portion of the body and the shoulder of the sleeve engaged therewith, a perforated plate held between each pair of washers, a reducing bushing formed of sheet metal and having tapered end portions, a rubber bushing having exterior threads formed thereon said bushings being screwed into the minor portions of the sleeves and each being adapted for engagement with either of said minor portions, and a filter-bed in the body between the perforated plates.

702,496. PUMPING APPARATUS. JAMES W. BARNES, Alhambra, Tex. Filed Jan. 20, 1902. Serial No. 91,251. (No model.)

Claim.—1. In a pumping or water-elevating apparatus, the combination of a main frame, a cylinder arranged to receive from a source of supply and having a valve-controlled inlet, and a discharge, a vertically-movable piston arranged in the cylinder, a ratchet-bar connected to the piston and guided in the frame and having beveled teeth A', a latch fulcrumed in the frame in a position to engage the teeth A' of the ratchet-bar and having a beveled hook at its lower end, a lever fulcrumed on the frame, a dog carried by said lever in a position to engage the beveled hook of the latch, and having a hook at its upper end adapted to engage the beveled hook of the latch, and means on the lever for drawing the dog out of engagement with the teeth of the ratchet-bar and into a position to enable its hook end to engage the hook end of the latch.

2. In a pumping or water-elevating apparatus, the combination of a main frame, a cylinder arranged to receive from a source of supply and having a valve-controlled inlet, and a discharge, a vertically-movable piston arranged in the cylinder, a ratchet-bar connected to the piston and guided in the frame and having the oppositely-beveled teeth A', a latch fulcrumed in the frame in a position to engage the teeth A' of the ratchet-bar and having a beveled hook at its lower end, a lever fulcrumed on the frame, a dog carried by said lever in a position to engage the beveled hook of the latch, means on the lever for drawing the dog out of engagement with the teeth A' of the ratchet-bar and into a position to enable its hook end to engage the hook end of the latch, a second lever, a dog carried thereby and arranged to engage the teeth A' of the ratchet-bar, and means on the second lever for drawing the dog thereof out of engagement with the ratchet-teeth A'.

3. In a pumping or water-elevating apparatus, the combination of a main frame, a cylinder arranged to receive from a source of supply and having a valve-controlled inlet, and a discharge, a vertically-movable

piston arranged in the cylinder, a ratchet-bar connected to the piston and guided in the frame, and having beveled teeth A', a head arranged on said ratchet-bar, and having projections adapted to receive weights, a latch-folium in the frame in a position to engage the teeth A' of the ratchet-bar, a lever fulcrumed on the frame, and a dog carried by said lever in a position to engage the teeth A'; said dog and the latch being provided with coacting means whereby when engaged they are held out of engagement with the ratchet-bar.

4. The pumping or water-elevating apparatus described comprising the main frame having the tubular upright provided in two opposite walls with slots, a cylinder arranged to receive from a source of supply and having a valve-controlled inlet and a discharge, a vertically-movable piston arranged in the cylinder, a bar connected to the piston and having sets of two oppositely-disposed ratchet-teeth A A', at two opposite sides, the latches fulcrumed in the slots of the upright in positions to engage the teeth A' of the ratchet-bar and having beveled hooks at their lower ends, levers fulcrumed on the frame at opposite sides of the tubular upright, dogs carried by said levers in positions to engage the ratchet-teeth A', and having hooks at their upper ends, rods connected to the dogs and movable in guides on the levers, a head on the ratchet-bar having projections for the connection of weights, levers fulcrumed in suitable supports below the main frame, dogs carried by said levers and arranged to engage the teeth A of the ratchet-bar, and rods movable in guides on the last-named levers and connected to the dogs thereof.

702,497. FLUID-PRESSURE COUPLING. WILLIAM H. BERNSON, Alexandria, Va. Filed Nov. 8, 1901. Serial No. 81,562. (No model.)

Claim.—1. A fluid-pressure coupling for pipes, comprising in combination with the heads of draw-heads, recessed on opposite sides of its car-coupler a boxing seated in one of said recesses, and a coupling-head in the other, a passage-way leading through said boxing and a pipe communicating with said passage-way, ball-valve in said pipe, and a valve-seat at the inner end of said pipe, a valve-regulated pipe connected to said coupling-head, a valve in the coupling-head, and means carried by said boxing for holding said valve in the coupling-head from seating as two draw-heads similarly equipped with couplings come together, as set forth.

2. A fluid-pressure coupling for pipes, comprising in combination with a draw-head, recessed on opposite sides of the car-coupler mounted on said draw-head, a boxing seated in one of said recesses, said boxing being spring-actuated having a vertical play, a pipe secured to said boxing and having communication with a passage-way therein, a valve in said pipe, a valve-seat near the inner end of said pipe, a coupling-head in the other of said recesses, a pipe secured to said head and communicating with a passage-way in the head, the outer end of the coupling-head being tapered, a ball-valve positioned in said tapering end, and means in said boxing for holding the ball-valve open when two draw-heads equipped with similarly constructed couplings come together, and the car-couplers for holding the pipe-couplings connected, as set forth.

3. A fluid-pressure pipe-coupling, comprising in combination with the draw-heads of car-couplings, each draw-head having recesses on its coupling edge, a boxing seated in one of said recesses, the outer face of said boxing being recessed and having tapered walls, a cushion forming the bottom of said recess in the boxing, a fixed pin projecting through a central aperture in said cushion with a space about same, a pipe connected to the boxing and communicating with a passage-way therein, the latter leading to the aperture in said cushion, a ball-valve in said pipe, a valve-seat at the inner end of the pipe, a spring on which the boxing is mounted, a coupling-head spring-actuated and seated in the other recess, the outer end of the head being tapered, a valve-seat at the apex of said tapered portion about an aperture in the head, which passage-way leads to and communicates through said aperture in the tapered portion of the said pipe adapted to be connected to the main air-supply pipe, as set forth.

702,498. REIN-SUPPORT. JAMES T. SMITH, Chapel Hill, Tenn. Filed Mar. 10, 1902. Serial No. 97,582. (No model.)

Claim.—1. A rein-support comprising an attaching member including a wire frame adapted for attachment to one end of the dashboard, one end of the wire of the frame being bent to form a double hook the members of which are in spaced relation, said frame having a socket, and a rein-supporting member consisting of a wire bent to form a frame including a body portion and a laterally-projecting terminal portion, adapted to support the reins interchangeably, the body portion of the second member lying at one end between the members of the double hook of the first member and having an end of the wire of which it is formed bent to form an eye and disposed between the eyes of the first member to receive a pivot-pin, the second member having a lug for engagement with the socket of the first member to hold the second member at one point of its pivotal movement.

2. A rein-supporting device comprising an attaching member and a second member pivotally connected thereto for movement into erect and reclining positions, said support having separate active supporting portions 34 and 35 disposed for movement into operative positions interchangeably as the pivoted member is moved into erect and reclining positions.

3. A rein supporting and holding device comprising an attaching member and a second member pivotally connected thereto for movement into erect and reclining positions, said member having separate rein-supporting portions 34 and 35 disposed for movement into operative positions interchangeably as the pivoted member is moved into erect and reclining positions, and having a rein-clamping portion disposed for operation in both positions of the movable member.

702,499. HAND ROCK-DRILL. VALERIE Y. SMITH, Oakland, Cal. Filed July 17, 1901. Serial No. 68,694. (No model.)

Claim.—1. The combination in a drill of a slotted casing, a drill-shank guided and longitudinally slidable within the casing, means by which the drill and shank are partially rotated at each reciprocation, a double centrally-pivoted lever, slide-bars connected to the arms of said levers, spring-pressed bell-crank levers pivoted in the rear ends of the slide-bars and having one arm extending in the direction of the length of said bars and the other arm projecting laterally through the slot in the casing and into the path of the drill-shank, to engage and retract the latter, and means for alternately engaging one of the arms of a bell-crank lever to withdraw the other arm from engagement with the drill-shank.

2. The combination in a drill of a casing, a drill-shank guided longitudinally therein, means by which the shank is given a partial rotation during each reciprocation, a centrally-pivoted lever on the outside of the casing, two slide-bars extending in the same direction and one disposed over the other said bars each having one end connected to one arm of the centrally-pivoted lever, bell-crank levers pivoted in the rear ends of the

slide-bars, having one arm extending in the direction of the length of said rods and the other member projecting laterally into the casing in the path of the drill-shank, and adapted to engage and retract the latter, means in the path of the first-named members of the bell-crank levers adapted to engage said members and alternately withdraw the other members from engagement with the drill-shank, and a spring by which the shank is impelled forward after the release.

3. The combination in a drill of a casing, a spring-impelled drill-shank, means for partially rotating the same at each reciprocation, said shank having a head fixed to the rear end, and said casing having an opening in its side leading to said head, a double centrally-fulcrumed lever exterior to the casing, slide-bars disposed one above the other and both extending in the same direction, and having their front ends connected to the double lever, bell-crank pawl-levers mounted in the rear ends of the slide-bars, each having one arm extending in the direction of the length of the bars and another arm extending transversely and entering through the slot of the casing, adapted to engage the head on the drill-shank, springs acting against said pawl-levers, and means in the path of the levers for depressing them to cause the release of the retracted drill-shank.

4. The combination in a drill of a closed casing having an internal abutment, a centrally-guided slidable drill-carrying shank having a head upon its inner end, and a spring surrounding the shank and having one end to rest against said abutment, said spring being compressible by the retraction of the drill-shank and acting to impel the latter forward when released; bell-cranks carried by rods longitudinally slidable upon opposite sides of the cylinder, one arm of each bell-crank extending in the direction of the length of the rods and another arm extending transversely and entering an opening in the casing, and adapted to alternately engage the head of the drill-shank; fixed inclines on the outside of the casing in the path of travel of the other arms of the bell-cranks, acting to disengage the first-named arms from the head of the drill-shank, and springs acting against the bell-cranks to return them to normal position after being depressed by the inclines; a double centrally-fulcrumed lever with opposite ends of which the rods carrying the bell-cranks are connected, and a single hand-lever connected with the center of the double lever, by the up-and-down movement of which said lever is actuated.

5. The combination in a drill, of a closed cylindrical casing having a front guide for the drill-shank, a centrally-guided slidable drill-carrying shank having a head upon its inner end, spring-pressed bell-crank levers fulcrumed in the rear end of the longitudinally-movable rods, one arm of each lever engaging the head on the drill-shank at each rearward movement, fixed inclines with which the other arms of the bell-cranks engage to release the drill-shank at the termination of its rearward movement, a fixed stop in the casing in front of said head and forming a rear guide for the drill-shank, a collar and means for changing its position upon the drill-shank, a spring interposed and compressible between the two when the drill is retracted, and a cushion-spring located between the collar and the front of the casing, said collar capable of regulating the tension of both springs, substantially as described.

702,500. WATCH-DEMAGNETIZER. PETER SCHMIDT, Brooklyn, N. Y. Filed Jan. 9, 1902. Serial No. 88,979. (No model.)

Claim.—1. In a demagnetizing apparatus, the combination of a rotatable electromagnet, the shaft carrying the same and having one end of the magnet-coil in electrical connection with it, the bracket of conducting material secured to a wall of the casing, a conducting-ring upon said shaft in electrical connection with the other end of the magnet-coil, a spring mounted upon an insulated support carried by the bracket and bearing upon said ring, a battery connected with one pole to said spring, and means for closing a connection from the other pole of the battery to the supporting-bracket for the shaft.

2. In a demagnetizing apparatus, the combination substantially as described of a rotatable electromagnet, a battery for charging the same, an actuating-handle for rotating said magnet and an automatic circuit closer and breaker mounted in the handle, an actuating-button mounted in said handle for closing the circuit, and a spring for automatically breaking the circuit of said battery and electromagnet when the operator lets go the handle, as and for the purpose described.

3. In a demagnetizing apparatus, the combination substantially as described, of a rotating electromagnet, an actuating-handle secured to the arm of the actuating-shaft, a hollow screw mounted in a counterbore opening in the handle and serving to secure the same to the crank, a circuit making and breaking pin passing longitudinally through said screw and handle, and an actuating-button therefor mounted in a transverse opening in the handle.

4. The combination substantially as described with a crank 14 connected to one pole of an electric circuit through the shaft carrying the same, a stationary ring or collar 20 surrounding said shaft and connected to the other pole of the circuit, means for making and breaking electrical connection between the crank and the ring, an actuating-pin therefor mounted in a longitudinal opening passing through the handle and crank, an actuating-button mounted in a transverse opening in said handle for actuating the pin in a direction to close the circuit, and a suitable spring for operating the pin in the other direction to open the circuit, all as described, whereby during rotation of the shaft the circuit will be automatically maintained by rotating contact with the ring 20, while the circuit will be automatically opened when the operator lets go of the handle.

5. The combination substantially as described of the crank 14, shaft 10, ring 20, handle 12, hollow screw 16 fastening said handle to the crank, a longitudinally-movable pin therein, a spring adapted to engage with ring 20 and bearing against one end of the pin, and an operating-button 18 engaging with the opposite end of the pin.

6. In a demagnetizing apparatus, the combination substantially as described of the rotatable electromagnet or shaft carrying the same and provided with an insulated conducting-ring to which one end of the magnet-coil is secured, the transverse operating-shaft 10 passing through the wall of the casing and surrounded by conducting-ring 20 fixed in said

well, a suitable bracket 9 provided with bearings for said shaft, contact-spring 22 engaging the ring 21 but insulated from the bracket, and an actuating-crank in electrical connection with the shaft and bracket and carrying contact devices whereby continuous connection may be maintained with ring 20, to maintain the circuit of the electromagnet during rotation of the same.

7. The combination substantially as described of a battery, a casing, a rotatable shaft within said casing, an actuating-handle for rotating said shaft and an automatic circuit-closer and breaker mounted in the handle, an actuating-button mounted in said handle for closing the circuit, and a spring for automatically breaking the circuit of said battery when the operator lets go the handle, as and for the purpose described.

702,501. HYDRAULIC JACK. WILLIAM K. STANBURY, Middle-town, N. Y., assignor to William H. Dodgeon, executor of Richard Dodgeon, deceased. Filed Mar. 4, 1902. Serial No. 54,331. (No model.)

Claim.—1. In a hydraulic jack a cylinder having a ring at or near the upper end of its bore of softer material than that of the ram, for the purpose set forth.

2. In a hydraulic jack a cylinder having a ring at or near the upper end of its bore of softer material than that of the ram, the interior diameter of the ring being slightly less than that of the bore of the cylinder, for the purpose set forth.

3. In a hydraulic jack a cylinder having a recess formed at or near the upper end of its bore and a ring of softer material than that of the ram, rigidly fastened within said recess, for the purpose set forth.

4. In a hydraulic jack a cylinder having a recess formed at or near the upper end of its bore and a ring of softer material than that of the ram rigidly fastened within said recess, the interior diameter of the ring being slightly less than that of the bore of the cylinder, for the purpose set forth.

702,502. BEAN-HARVESTER. JOHN E. STANTON, Franklin, Ohio. Filed Sept. 26, 1901. Serial No. 70,573. (No model.)

Claim.—1. In a harvester of the class described, a pair of revoluble pulling elements adapted for universal angular movement, in combination with means to incline the same so that their lower sides converge, substantially as described.

2. A pair of revoluble pulling elements adapted for universal angular movement, in combination with yielding means to incline the same so that their lower sides converge, substantially as described.

3. In a harvester of the class described, a pair of revoluble pulling elements comprising rines and spring-supporting spines therefor, whereby the said rines are adapted for universal angular movement, in combination with means to incline the same so that their lower sides converge, substantially as described.

4. In a harvester, of the class described, a pair of flexible revoluble pulling elements adapted for universal angular movement, in combination with means to incline the same so that their lower sides converge, substantially as described.

5. In a harvester of the class described, a pair of flexible revoluble pulling elements having rines adapted for universal angular movement, the said rines forming jaws for engaging the plants and lifting the same, in combination with springs bearing against the outer sides of said rines to incline the same so that their lower sides converge, substantially as described.

702,503. DEVICE FOR GUIDING WAGONS ON TRACKS. STEPHEN H. STEWART, Brooklyn, N. Y. Filed Apr. 2, 1901. Serial No. 54,794. (No model.)

Claim.—The combination with the axle or pole of a vehicle, of means for guiding the latter along supporting-tracks, said means comprising an axle having flanged wheels on its outer ends, and attaching devices carried by the axle and removably applied to said axle or pole at sufficient distance from the front axle of the vehicle to turn said front axle and accurately guide the vehicle.

702,504. VEHICLE. FRANKLIN STANTON, Buffalo, N. Y. Filed July 3, 1900. Serial No. 23,208. (No model.)

Claim.—1. A vehicle or the like having a front block and a rear axle, a reach having rotatable rods connecting said front block and rear axle, front and rear crank-arms extending from said rods, a body, springs between said body and the front block and rear axle, connections between the front and rear crank-arms and the respective extremities of the body, a rotatable transverse rod supported by the body, crank-arms extending from said rod and connections between the crank-arms and one of the axles, substantially as set forth.

2. In a vehicle or the like, the combination with the body, front block and rear axle and springs between said block and axle and the body, of a reach connecting said front block and rear axle and having two rods rotatably supported from the block and axle, crank-arms rigidly mounted on said rods and rods pivoted at their ends to the body and the ends of the crank-arms, a transverse rod rotatably supported by the body above the axle or block and two-part pivotally-joined connections between the transverse rod and the ends of the axle or block, substantially as set forth.

702,505. POCKET-CLOSURE. JOHN E. STYER, Chicago, Ill. Filed Jan. 14, 1901. Serial No. 42,348.

Claim.—In a pocket-closure, the combination of two flat resilient strips of different lengths, riveted together and curved around the upper edge of the pocket, the longer strip projecting at each end of the shorter strip, and one of the strips projecting above the other at the edge of the pocket, whereby the opening of the pocket is facilitated, substantially as set forth.

702,506. CLOTHES-POUNDER. STERLING B. TAYLOR, Junction City, Ark. Filed Apr. 11, 1901. Serial No. 55,277. (No model.)

Claim.—1. A clothes-pounder comprising an outer shell, an inner shell spaced throughout its entire length from the outer shell and supported from the same, said inner shell being open at its top to permit water to flow upward in the space between it and the outer shell and to flow over its upper edges and pass downward through it, and a soap-holder arranged within the inner shell and detachably connected with the same at the top thereof, said soap-holder being open at the top and arranged to receive the water flowing over the upper edges of the said inner shell, substantially as described.

2. A clothes-pounder comprising a shell, open at the top to permit water to flow over its upper edges a cylindrical soap-holder detachably interlocked at its upper end to the shell, and a brace mounted on the shell and provided with a ring arranged to receive the soap-holder, substantially as described.

702,507. NAVIGATIONAL SOUNDING APPARATUS. SARA L. TAYLOR, U. S. Navy. Filed Nov. 1, 1901. Serial No. 50,754. (No model.)

Claim.—1. In a navigational sounding apparatus, the combination with a winding-drum, of the frame supporting said drum, brake-shoe, on the frame, and a hand-lever operating on the frame to compress the brake-shoes on the drum.

2. In a navigational sounding apparatus, the frame-supporting drum, an elastic metallic frame supporting said drum, brake-shoes on the frame at the sides of the drum, right and left screws connected to the frame, and

a sleeve with right and left screw-thread embracing said screws, whereby the rotation of the sleeve springs the frame and applies the brake-shoes to the drum.

3. The combination with the winding-drum of a machine as described, of the metallic frame having spring-bars projecting above said drum, the brake connected to said bars so as to bear on the drum, and the brake-operating lever directly above the drum, so that the drum and brake are under immediate observation, substantially as described.

4. In a navigational sounding apparatus, the combination with the drum having flanges as described, the wire on each drum, the frame supporting the drum, tie-bolts extending from side to side of the frame, and sleeves on the tie-bolts extending within the periphery of the drum-flanges and acting as guards to the sounding-wire, substantially as described.

5. The combination, in a machine for navigational sounding, of the supporting-frame, a drum-shaft and drum carried thereby, a sleeve on the shaft and free to rotate but held against longitudinal movement, a crank hinged to said sleeve, and means for engaging the crank-bar, near the hinge, with the drum-shaft, so that the crank may be operative, or turned out of the way and the drum left to run free.

6. The combination, in a navigational sounding-machine, of a metallic frame, a drum and drum-shaft supported on the frame, a crank held by hinged connection to the shaft, means for engaging the crank with the shaft or for permitting the shaft to run free, and a brake connected to the frame in position to operate on the drum as an auxiliary to the crank.

7. In a navigational sounding-machine, the combination with the frame, drum, and drum-shaft, of cranks having hinged connection to the shaft at each end, and means for disengaging the cranks with the shaft or for turning them out of working engagement, and means for holding the cranks against swinging when so turned out of working engagement with the shaft, substantially as described.

8. In a navigational sounding apparatus, the combination of the frame, the drum-shaft and drum, said drum-shaft having polygonal ends, sleeves near the ends of the shaft free to turn but secured against longitudinal movement, a crank-bar hinged to each sleeve and having a polygonal mortise to turn over the shaft and as described, a handle on each crank, and friction apparatus on the casing to hold the cranks when swung away from operative engagement with the shaft.

9. In a navigational sounding-machine provided with means for attachment to a ship's deck, the combination with the frame and drum, of a box including the frame, the shaft extending through the box, the cranks hinged to the shaft outside the box and connected by hinged connection to the shaft, said box having notches into which the crank-handles may swing to hold the cranks when not in operative engagement with the shaft.

702,508. ENVELOP AND ADVERTISING-OPENER THEREFOR. FREDERICK TWILLEGGERMAN, Memphis, Tenn. Filed Mar. 26, 1902. Serial No. 100,117. (No model.)

Claim.—1. The combination with an envelop having a small aperture at one margin, of a cutting-plate lying within the envelop and having a member passed out through said aperture and provided with a shoulder normally projecting beyond the limit of the aperture and thereby preventing the member from moving inward.

2. The combination with an envelop having a suitable slot at one margin, of a narrow cutting-plate lying within the envelop on the side toward said margin, extending the full length of the latter, and provided with a member extending through said slot and having its external portion wider than the latter, whereby the plate is prevented from moving from said side.

3. The combination with an envelop, of a cutting-plate lying within the envelop, and means whereby said plate may be drawn outward while the envelop is closed and made to cut through and thus open the same, said envelop being provided with a flap preventing the edge of the plate from engaging the latter as it is passing into the open envelop.

702,509. APPARATUS FOR ROTATING TUBES OR SIMILAR OBJECTS. SILAS W. TITUS, Brooklyn, N. Y., assignor to Pneumatic Engineering Company, New York, N. Y., a Corporation of West Virginia. Filed Mar. 9, 1901. Serial No. 50,037. (No model.)

Claim.—1. The combination, in an apparatus for rotating tubing or similar objects, of two annular members relatively mounted with respect to each other, and both adapted to surround the object to be rotated, a

plurality of grippers carried by one of said members, and movable thereon, and means operating upon a relative rotary movement of the two members with respect to each other, to impart an inward movement to the said grippers.

2. The combination, in an apparatus for rotating tubing or similar objects, of two annular members relatively mounted with respect to each other, and both adapted to surround the object to be rotated, a plurality of grippers carried by one of said members, and movable thereon, and means operating upon a relative rotary movement of the two members with respect to each other, to impart an inward movement to the said grippers.

3. The combination, in an apparatus for rotating tubing or similar objects, of two members relatively mounted with respect to each other, a plurality of grippers carried by one of said members, and adapted to have a substantially radial movement thereof with respect to its axis of rotation, and means carried by the other of said members for imparting such radial movement to the said grippers, upon a relative movement of the two members with respect to each other.

4. The combination, in an apparatus for rotating tubing or similar objects, of two members relatively mounted with respect to each other, a plurality of grippers, carried by one of said members, and adapted to have a substantially radial movement thereof with respect to its axis of rotation, and means carried by the other of said members for imparting such radial movement to the said grippers, upon a relative movement of the two members with respect to each other in either direction.

5. The combination, in an apparatus for rotating tubing or similar objects, of two members through which the said tubing or other object to be rotated extends, said members relatively mounted with respect to each other, a plurality of grippers carried by one of said members, and each adapted to have a longitudinal movement in a substantially radial line toward and away from the object to be rotated, and means carried by the other of said members for imparting such radial movement to the said grippers, upon a relative rotary movement of the two members with respect to each other.

6. The combination, in an apparatus for rotating tubing or similar objects, of a rotatable gripper-ring, a plurality of grippers mounted upon said ring and each adapted to have a longitudinal movement in a substantially radial line with respect to the axis of rotation of the member carrying it, a rotatable base-plate with respect to which said gripper-ring is adapted to have a limited relative rotary movement, and means operated by the movement of the base-plate relatively with the gripper-ring, for imparting such substantially radial movement to the grippers.

7. The combination, in an apparatus for rotating tubing or similar objects, of two members relatively mounted with respect to each other, a plurality of grippers carried by one of said members, and each adapted to have a longitudinal movement in a substantially radial line with respect to the axis of rotation of the member carrying it, and means carried by the other of said members for imparting such radial movement of the said grippers, upon a relative movement of the two members with respect to each other, together with springs between the two members tending to return them to their normal relative positions.

8. The combination, in an apparatus for rotating tubing or similar objects, of two members relatively mounted with respect to each other, a plurality of grippers carried by one of said members, and grippers comprising roll-holders and rolls for engaging the object to be rotated, so as to lock the same in a lateral or circumferential direction, but to permit a longitudinal movement of the said tube or other object with respect thereto, each of said grippers adapted to have a longitudinal movement in a substantially radial direction of the member by which they are carried, and means carried by the other of said members for imparting such radial movement to the said grippers, upon a relative rotary movement of the two members with respect to each other.

9. The combination, in an apparatus for rotating tubing or similar objects, of two members relatively mounted with respect to each other, a plurality of grippers carried by one of said members, means upon a relative rotary movement of the two members, for operating the said grippers, and a stop for temporarily locking one of the said members against rotation during said relative rotation of the other said member.

10. The combination, in an apparatus for rotating tubing or similar objects, of two members relatively mounted with respect to each other, a plurality of grippers carried by one of said members, means upon a relative rotary movement of the two members for operating the said grippers, a stop for temporarily locking one of the said members against rotation during a relative rotation of the other said member, and means for withdrawing the said stop, after the last said member has passed through a limited portion of its movement, to permit the members to rotate together.

11. The combination, in a rotating apparatus, of a base-plate and means whereby same may be rotated, a gripper-ring carried by said base-plate but adapted to have a limited relative rotary movement therewith, grippers carried by said gripper-ring, means on said base-plate adapted to operate said grippers, a spring between said base-plate and said gripper-ring, a ratchet and pawl carried, the one by the base-plate and the other by the gripper-ring, means for holding the gripper-ring during a partial revolution of the base-plate and during the initial operation of the grippers, and whereby the base-plate and gripper-ring are permitted to rotate together after the initial operation of the grippers.

12. The combination, in a rotating apparatus, of a plurality of grippers, a gripper-ring upon which said grippers are mounted, a base-plate upon which said gripper-ring is mounted and with which it is adapted to have a limited relative rotary movement, means upon said base-plate for operating said grippers, a pawl or latch carried by said gripper-ring, teeth upon said base-plate with which said pawl or latch is adapted to engage, a cam on said base-plate adapted to hold said pawl or latch out of engagement with said teeth against spring tension, and a stationary stop in engagement with said pawl or latch and adapted to hold same during a limited movement of the base-plate.

702,510. ATTACHMENT FOR LETTER-BOXES. CHARLES E. TRACY, Berkeley, and FRANK C. GOULD, Alameda, Cal. Filed Nov. 30, 1900. Serial No. 31,341. (No model.)

Claim.—1. In combination with a mail-box provided with suitable openings leading to the exterior thereof, of a slatted tray adapted to hold disinfestant material adjacent said openings outside the box, and a screw passing through the slot in the tray and engaging the box to hold the tray in place, substantially as described.

2. In combination with a mail-box provided with openings in its bottom, a holder, means for securing the holder to the bottom over the openings therein, means permitting access to the interior of the holder and a lock for said means, substantially as described.

3. In combination with a mail-box provided with suitable openings in the body portion thereof, a holder, means for securing the holder to the surface of the body over the openings therein, a removable tray in said holder, and means for locking the tray within the holder, substantially as described.

4. In combination with a mail-box provided with suitable openings in the body thereof, a holder, a removable tray in said holder, and a screw passing through said holder from the outside thereof and engaging the box to secure the holder thereto, substantially as described.

5. In combination with a mail-box provided with suitable openings in the body thereof, a flanged holder, means for detachably securing the

holder to the exterior of the box over the openings therein, a packing interposed between the surface of the box and the holder, and means for securing the holder to the box and forcing the flange of said holder against the packing, substantially as and for the purpose described.

6. In combination with a mail-box, a flanged holder adapted to receive disinfestant material, and means for detachably securing said holder upon the surface of the box, said box being provided with suitable inlets for fumes from the disinfestant material in the holder, substantially as described.

702,511. ENRALLING AND COOLING BOARD. JAMES A. TUNNEY and EDWARD F. O'DONOVAN, Toledo, Ohio. Filed July 4, 1901. Serial No. 67,410. (No model.)

Claim.—In an enralling and cooling board, the slatted main sections 1 and 2, hinged together at 3, the same being provided with suitable leg-supports, the grooved side pieces 13 of the main sections, the cross-pieces 14, secured crosswise between the outer ends of the side pieces 13, the slatted adjustable sections, slidably mounted with relation to the slatted main sections, having cross-pieces 10 at their inner ends provided with pivotal ends 11 adapted to occupy the grooves in the side pieces 13, and the means for supporting the adjustable section 9 at an inclination to the main section comprising a U-shaped member pivoted to a stationary part of the main section, a second U-shaped member pivoted to the outer end of the first-named U-shaped member, an engaging rod or plate secured to the main section, and teeth provided at the free ends of the second-named U-shaped member adapted to engage the rod or plate upon the main section, substantially as shown and described.

702,512. FOLDING-GUIDE FOR SEWING-MACHINES. CHARLES L. WATTEWAL, St. Louis, Mo., assignor to the Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed May 17, 1902. Serial No. 680,967. (No model.)

Claim.—1. In a sewing-machine having a suitable bed-plate, and stitch-forming mechanism, two independently-movable folding-guides, one right hand and one left hand, pivotally attached to the machine-frame and adapted to be swung down into operative position with relation to the stitch-forming mechanism, substantially as described.

2. In a sewing-machine, having a cylindrical bed-plate, upwardly and outwardly swinging independently-movable folding-guides one right hand and one left hand pivotally attached to the machine-frame and adapted to be swung down into operative position with relation to the stitch-forming mechanism, whereby tubular fabrics with either right or left hand folds may be sewed on the machine, substantially as described.

3. In a sewing-machine having two needles and complementary stitch-forming mechanism, and a presser-foot, two alternating swinging folders, one right hand and one left hand, pivotally attached to the machine-frame and adapted to be swung down into operative position with relation to the needles, the outer edge of one folder when in position being slightly at one side of said needles while when the other folder is swung into position its outer edge is slightly at the other side of said needles, whereby said folders when in operative position will occupy substantially the same position relatively to the needles: substantially as described.

702,513. STALK-CUTTER. WHITLEY B. WELSH, Parkersburg, Pa. Filed Aug. 24, 1900. Serial No. 57,572. (No model.)

Claim.—1. In a stalk-cutter, a frame, a rock-shaft, a tubular hanger provided with arms having hubs at their upper ends, said hubs rigidly mounted on the rock-shaft, a vertical shaft mounted in said tubular hanger provided with a disk at the lower end, radial knives fixed to said disk, means for operating said vertical shaft and knives and means for keeping said knives in a plane parallel with the ground, said means consisting of a lever pivoted to the frame, and a link, one end connected to the tubular hanger and the opposite end to the lever, substantially as described.

2. In a stalk-cutter, a tilting frame having two members pivoted together with their forward ends movable toward and from each other, means to effect said movement and to hold them in a fixed position, said frame mounted on an axle having wheels, a non-slidable clutch and a slidable clutch mounted on said axle, said slidable clutch having a sprocket-wheel secured thereto, means to move it into and out of engagement with said non-slidable clutch, a horizontal rock-shaft supported on the rear end of the frame, a tubular hub loosely mounted upon said rock-shaft having a sprocket-wheel and a beveled gear, a chain connecting said sprocket-wheel with the sprocket-wheel of said slidable clutch, a pivoted tubular hanger provided with arms having hubs rigidly mounted on the said horizontal rock-shaft, a vertical shaft mounted in said tubular hanger, provided with a disk, radial cutting-knives fixed to the top of said disk, and means for adjusting the hanger consisting of a lever having a link connected to the hanger, substantially as described.

3. In a stalk-cutter having a tilting frame as described and mounted on a revolvable axle with forwardly-engaging wheels on the extremities thereof and a sprocket-wheel secured to a clutch member movable back and forth thereon, with a rock-shaft and journaled in the rearward end of said frame and having a tubular hub carrying a sprocket-wheel and a beveled gear-wheel rotatably sleeved thereon, with an endless chain mounted on said sprocket-wheel, a tubular hanger with a yoke at the upper end thereof depending from said rock-shaft, said yoke embracing the ends of said tubular hub and the arms of the yoke rigidly secured to the shaft, a revolvable shaft journaled through said hanger having at its upper end a beveled gear-wheel intermeshing with the gear-wheel of the hub, and at its lower end a disk with radial cutting-blades having their inner ends rigidly secured to said disk, and a lever provided with a link connected to the hanger adapted to adjust said hanger for the purpose of keeping the knives in a plane parallel with the ground, substantially as described and for the purpose hereinbefore set forth.

702,514. CARBON-HOLDER. SAMUEL B. WHEAT, Pittsburgh, Pa., assignor to the Pittsburgh Blue Print Company, a Corporation of Pennsylvania. Filed Mar. 14, 1902. Serial No. 98,768. (No model.)

Claim.—1. In an are-lamp, a holder for one of the carbons having rotation about a vertical axis which includes the prolongation of the axis of the other carbon, the rotation of the holder producing lateral movement of the first carbon.

2. In an are-lamp, an axially-rotatable carbon-holder having a carbon-receiving opening which includes the axis of rotation of the holder, the rotation of the latter producing lateral movement of the carbon.

3. In an are-lamp, a carrier having an opening, a tubular carbon-holder rotatable in the opening, and means for holding the carbon inclined in the

opening, the rotation of the holder producing lateral movement of the carbon.

4. In arc-lamps, a rotatable carbon-holder adapted to hold a carbon inclined, whereby the rotation of the holder produces lateral movement of the carbon.

5. In arc-lamps, a carbon-holder rotatable about a fixed axis and having a bore central at one end and eccentric at the other, and means for holding the carbon in the bore.

6. In arc-lamps, a holder having a bore to receive a carbon, means for securing the carbon in the holder, the bore being flared so as to permit the adjustment of the carbon in a plane at an angle to the plane that includes the carbon and the said securing means.

702,515. MECHANICAL TOY. OSCAR C. WINNER, Kansas City, Mo. Filed Sept. 30, 1901. Serial No. 77,122. (No model.)

Claim.—1. A toy of the character described, comprising spring arm wires or pieces of substantially right-angular outline, having a V-shaped extension at one end and secured at the opposite end to a support, and a handle provided with means adapted to alternately engage said wires at their lower ends, substantially as set forth.

2. A toy of the character described, comprising spring arm wires or pieces secured at their lower ends and having bent extensions or branches, means adapted to alternately engage said wires, at their lower ends, and an overhanging support having suspended therefrom a "punching-bag" arranged in proximity to said bent extensions, substantially as set forth.

3. A toy of the character described, comprising spring arm wires or pieces fixed at their lower forward ends, means adapted to alternately engage and vibrate said wires, at their rear angular portions, and an upright fixed frame, with its vertical portions arranged in parallel lines to the vertical portions of said arm-wires and its top connecting portion arranged slightly above the upper ends of said vertical portions of said arm-wires for supporting the head and garment of the figure, substantially as set forth.

702,516. RIGHT AND LEFT NAIL-CLIPPER. HENRY WILCOX, Newark, N. J. Filed Oct. 12, 1901. Serial No. 73,194. (No model.)

Claim.—1. A nail-clipper having two levers formed each with a sheet-metal body-plate having integral side flanges, and having jaws at their forward ends, a pivot extended through the flanges adjacent to the jaws, and a spring to hold the jaws normally separated.

2. A nail-clipper having two levers formed each with a flat plate and side flanges, and having jaws at their forward ends, a pivot extended through the flanges adjacent to the jaws, a spring to hold the jaws normally separated, and the side flanges of one lever arranged to contact with the plate of the opposite lever to limit the separation of the jaws.

3. A nail-clipper having two levers formed each with a sheet-metal body-plate having integral side flanges, and having jaws at their forward

ends, a pivot extended through the flanges adjacent to the jaws, and a roughened finger-piece supported upon the flanges of each lever in the rear of the pivot.

4. A nail-clipper having two levers formed each with a sheet-metal body-plate having integral side flanges, and having jaws at their forward ends, a pivot extended through the flanges adjacent to the jaws, a roughened finger-piece supported upon the flanges of each lever in the rear of the pivot, and a spiral spring inserted within the jaws to hold them normally separated.

5. A nail-clipper having two levers formed each with a sheet-metal body-plate having integral side flanges, and having jaws at their forward ends, a pivot extended through the flanges adjacent to the jaws, a spiral spring inserted within the jaws to hold them normally separated, and a catch to lock the levers together and hold the jaws closed when desired.

6. A nail-clipper having two levers formed each with a sheet-metal body-plate having integral side flanges, and having jaws at their forward ends, a pivot extended through the flanges adjacent to the jaws, a roughened finger-piece supported upon the flanges of each lever in the rear of the pivot, a spring to hold the jaws normally separated, and a catch arranged to slide upon the plate of the upper jaw and engage the finger-piece upon the opposed lever to hold the jaws normally closed.

7. A nail-clipper having two levers formed each with a sheet-metal body-plate having integral side flanges, and having jaws at their forward ends, a pivot extended through the flanges adjacent to the jaws, a spring to hold the jaws normally separated, a finger-piece attached to the flanges of the lever carrying the lower jaw, and a file hinged to the lever of the upper jaw and roughened to form an opposed finger-piece, substantially as herein shown and described.

8. A nail-clipper having two curved cutting-flanges arranged respectively at the right and left sides of a central point, and adapted to trim the right and left sides of the finger-nail with very little change of position on the part of the body of the cutter.

9. A nail-clipper having two curved cutting-flanges arranged respectively at the right and left sides of a central point, and finger-levers carrying jaws forming each cutting-flange and joined together by a pivot adjacent to each cutter, and projected backward from each pivot.

10. A nail-clipper having two curved cutting-flanges arranged respectively at the right and left sides of a central point, finger-levers formed each with a flat face and side flanges and provided with the jaws forming each cutting-flange, a pivot extended through the flanges adjacent to the jaws, a spring to hold the jaws normally separated, and a roughened finger-piece supported upon the flanges of each lever in the rear of the pivot.

702,517. HAND-VISE. WALTER H. WILKINSON and WILLIAM A. HERRA, Cincinnati, Ohio. Filed Mar. 14, 1902. Serial No. 90,191. (No model.)

Claim.—1. In a hand-vise, the combination of the jaws comprising the wooden portions hinged together at one end and having the recesses *d* and grooves *e* in their inner sides at their opposite ends, and the metallic caps or end portions connected to the wooden portions and having clamping edges provided with notches, disposed in front of the recesses and grooves of said wooden portions, and means for holding the jaws together.

2. In a hand-vise, the combination of the jaws comprising the wooden portions of semicircular form in cross-section hinged together at one end with their flat sides inwardly and having the recesses *d* and grooves *e* in said flat sides at their opposite ends, and the metallic caps or end portions connected to the wooden portions, and having notched clamping edges disposed in the same plane as the flat inner sides of the wooden portions, adjustable means for holding the jaws together, and means for holding said jaws against lateral deflection incident to their movements toward and from each other.

702,518. NEWSPAPER-HOLDER. JOSEPH WILLON, New York, N. Y. Filed Apr. 2, 1902. Serial No. 100,019. (No model.)

Claim.—1. In a newspaper-holder of the character herein set forth, the combination with a standard having a base for application to a table or board, of a slide mounted and movable upon the standard, projecting arms hinged upon the slide, a roller applied upon and between said arms, and a spring bearing upon the arms and against the slide and arranged

to press the roller down independently of the position of the slide, substantially as shown and described.

2. In a newspaper-holder of the character herein set forth, the standard composed of two pieces united at top and bottom and having a base for application to a table or board, the slide mounted upon the standard as explained, the arms hinged upon the slide, the roller applied between and upon the outer extremity of the hinged arms, and a coiled spring bearing against the slide and upon the arms, the whole being combined and arranged substantially as shown and described.

702,519. SHADE-BRACKET. EDGAR H. WINFREY, Wichita Falls, Tex. Filed Oct. 17, 1901. Serial No. 79,017. (No model.)

Claim.—A window-shade bracket, consisting of telescopic sections, bracket-arms fitted in the outer ends of said telescopic sections, and fastenings having eyes to engage each section and frictionally hold the same in adjusted position, and frictionally hold the bracket-arms in the ends of said telescopic sections, said fastenings having attaching means whereby they may be secured to a window-frame, substantially as set forth.

702,520. DEVICE FOR HINDING HAY ON WAGON. JAMES E. WHITEBORN, Laguard, Iowa. Filed Feb. 12, 1902. Serial No. 94,626. (No model.)

Claim.—1. In a device for hindering hay on a wagon, a straight frame having a longitudinal groove in its top extending from end to end, two straight racks fitted in the groove to slide in reverse ways, means for fastening ropes to the ends of the racks, a lever fulcrumed to the central portion of the frame, a duplex pawl pivoted in a recess at the lower end of the lever to alternately engage the slidable racks, arranged and combined to operate in the manner set forth for the purposes stated.

2. In a device for hindering hay on a wagon, a straight frame having a longitudinal groove in its top extending from end to end, two straight racks fitted in the groove to slide in reverse ways, means for fastening ropes to the ends of the racks, a lever fulcrumed to the central portion of the frame, a duplex pawl pivoted in a recess at the lower end of the lever to alternately engage the slidable racks, pawls mounted at the ends of the frame to engage the racks, grooves in the outside faces of the racks and devices fixed to the frame to enter the grooves, arranged and combined to operate in the manner set forth for the purposes stated.

3. In a device for hindering hay on a wagon, a straight frame having a longitudinal groove in its top extending from end to end, two straight racks fitted in the groove to slide in reverse ways, means for fastening ropes to the ends of the racks, a lever fulcrumed to the central portion of the frame, a duplex pawl pivoted in a recess at the lower end of the lever to alternately engage the slidable racks, pawls mounted at the ends

of the frame to engage the racks, grooves in the outside faces of the racks, devices fixed to the frame to enter the grooves, and ropes connected with the ends of the racks arranged and combined to operate in the manner set forth for the purposes stated.

702,521. PUMP-MOTOR. PRINCE & WOOD, Smithville, Mo. Filed Sept. 12, 1901. Serial No. 74,021. (No model.)

Claim.—1. A pump-motor, comprising a train of gearing, a hollow weight, a cable connection between the weight and gearing whereby the latter is actuated by the descent of the weight, and means encircled by the weight for preventing the latter when moving from contacting with that portion of the pump which it surrounds, substantially as described.

2. A pump-motor, comprising a train of gearing, a hollow weight, a cable connection between the weight and the gearing, a horse-power mechanism for winding the cable on the drum of the gearing, a governor for regulating the speed of the descending weight, and a guide extending through the hollow weight to prevent it from contacting with that portion of the pump which it surrounds, substantially as described.

3. A pump-motor, comprising a shaft, drums mounted thereon, a hollow weight adapted to encircle the water-elevating portion of the pump, an equalizing-bar pivoted thereon, cables connecting the drums and the weight in such a way as to prevent lateral movement of the latter when ascending or descending, means for simultaneously winding the cables on the drums, and suitable gearing for transmitting power from the drums, substantially as described.

4. In a pump-motor, a drum, a shaft upon which it is rigidly mounted, a worm-wheel loosely mounted upon the shaft, an integral clutch member formed on the worm-wheel, a compression clutch member reciprocally mounted upon the shaft and adapted to turn therewith, a lever for locking or unlocking the clutch members, a worm meshing with the worm-wheel, means for rotating said worm, a ratchet-wheel rigidly mounted upon the shaft, a cog-wheel loosely mounted thereon, a spring-actuated pawl secured to the side of the cog-wheel and adapted to engage the ratchet-wheel when the latter rotates in a certain direction, a sprocket-wheel, a shaft upon which it is rigidly mounted, a pinion also rigidly mounted upon said shaft, intermediate cog-wheels for transmitting motion from the cog-wheel on the drum-shaft to the pinion, a brake-wheel rigidly mounted upon the pinion-shaft, a brake-shoe adapted to embrace the brake-wheel, a governor adapted to operate the brake-shoe, a weight, and a cable support securing it to the drum, substantially as described.

702,522. RAILWAY-SWITCH. WILLIAM C. WOOD, New York, N. Y. Filed Dec. 12, 1901. Serial No. 94,121. (No model.)

Claim.—1. In a railway-switch, a hinge-pin entering from the lower face of the tongue and extending to a point below its upper face, and means for flexibly fastening said pin into the tongue to turn with the swinging movement of the tongue, substantially as described.

2. In a railway-switch wherein a vibrating tongue is used for shifting the course of a track from a single track to a branch thereof, a vertical pin entering from the lower face of said tongue and extending upwardly to a point below the upper face of the tongue and having its upper end concealed by said tongue, and means for fixedly fastening the said pin to said tongue to turn with the swinging movement of the tongue, substantially as specified.

3. In a railway-switch, the combination with a tongue having on its under side a socket or recess, the end wall of which is located in a plane below that of the upper face of the tongue, and a pin inserted in the socket or recess, and means for fixedly fastening the pin in the socket or recess to turn with the swinging movement of the tongue, substantially as and for the purpose set forth.

4. In a railway-switch, the combination with a vibrating tongue having a recess or socket in its under side, the end wall of which is in a plane below that of the upper face of the tongue, in combination with a pin for connecting the hinge-pin to the switch-tongue, a vertically-adjustable bearing-bar, and an adjusting-wedge, substantially as set forth.

5. The combination with a vibrating switch-tongue having a socket or recess in its lower face, the lower wall of said socket or recess being in a plane below that of the upper face of the tongue, said pin at that point which enters the socket or recess being formed with a groove, and a rabbitt metal let into said groove to lock the pin in place, substantially as set forth.

702,528. CLIP. PHILIP H. YAWMAN, Rochester, N. Y., assignor to the Yawman & Bibo Mfg. Co., Rochester, N. Y., a Corporation of New York. Filed Jan. 31, 1901. Serial No. 45,414. (No model.)

Claim.—1. In a paper-clip, the combination with the stationary member constructed of a single piece of sheet material embodying the base-flange having the loop and leg therein, the front flange extending beyond the base at the ends, the legs extending rearwardly from the front flange, and the spurs extending downwardly from the ends of the latter, of the pin arranged in the perforated rearwardly-extending legs, the movable member provided with the perforated legs journaled on the pin and having the handle, and the spring controlling the pin having the loop at the center engaging the leg on the stationary member and the arm engaging the movable member.

2. In a paper-clip, the combination with the stationary member adapted to be applied to a support having the base-flange provided with the loop and the leg therein, the front flange having the rearwardly-extending perforated ears and the projections extending below the base-flange, of the movable member having the downwardly-extending perforated legs, the pin and the spring controlling it and engaging the two members, and the catch pivoted on the front flange and adapted to engage the movable member forward of its pivot to hold it out of operative position.

702,524. EYEGLASS-CASE. WILLIAM EDGES and JOHN J. HARRIS, Boston, Mass., assignors, by mesne assignments, to Elizabeth Zerk, Boston, Mass. Filed Jan. 6, 1902. Serial No. 52,494. (No model.)

Claim.—1. In an eyeglass-case, the combination of the lids and lining and a spring-hinge connection concealed beneath the lining, comprising a spring-acting element on one lid, constructed and arranged to support the lining at a predetermined elevation as the lids open and close,

and a cam on the other lid working up and down uniformly below the top of said spring-acting element, substantially as described.

2. In an eyeglass-case, the combination of the lids and lining and a spring-hinge connection concealed beneath the lining, comprising a spring-acting element on one lid having a vertically-disposed end portion to support the lining at a predetermined elevation as the lids open and close, and a cam on the other lid engaging said spring-acting element and working up and down uniformly below the top of the end portion thereof, substantially as described.

3. In an eyeglass-case, the combination of the lids and lining and a spring-hinge connection concealed beneath the lining, comprising a spring-acting element on one lid consisting of a pair of spring-acting arms having vertically-disposed end portions located side by side, and a cam on the other lid engaging said spring-acting element and working up and down below the top of the end portions of said spring-acting arms, substantially as described.

4. In an eyeglass-case, a spring-hinge connection for the lids comprising a spring-acting element on one lid consisting of a spring-acting arm disposed lengthwise the case and attached at one end to the upturned rear edge of one of the lids and having at its extremity a broad end portion, vertically disposed, and a cam on the other lid engaging said broad end portion and working up and down below its top, substantially as described.

5. In an eyeglass-case, a spring-hinge connection for the lids comprising a spring-acting element on one lid having a vertically-disposed portion formed with angularly-disposed faces on its rear side and a cam on the other lid working up and down below the top of said portion and across the junction of said faces, substantially as described.

702,525. CAKE COOKER AND TURNER. HARRY W. AAKER and CHARLES M. GOODWIN, Cuba, N. Y. Filed Aug. 29, 1901. Serial No. 73,728. (No model.)

Claim.—1. A cake cooking and turning device comprising a supporting-ring having two sets of diametrically opposite sockets arranged at right angles to each other, means for raising and lowering said ring, and a cake-pan provided with transverse flanges in one set of sockets to turn upon the ring and consisting of hinged sections, one having a handle attached thereto and the other sockets at diametrically opposite sides thereof for the reception of the handle to open and close said later-mentioned section and to lower and raise the pan to and from its supporting-ring, said handle being adapted to rest in one socket of the other set of sockets

when the pan is in a lowered position to prevent said pan from turning, substantially as described.

2. In a cake cooker and turner, the combination with a vessel; of guides adapted to fit over the upper edge of the vessel, a supporting-ring, perforated bars connected to the ring and sliding through said guides, pins adapted to be passed through the perforations in the bars to support them in adjusted position upon said guides, and a cake-pan provided with transverse flanges to turn upon the ring, and consisting of hinged sections, one having a handle attached thereto and the other sockets at diametrically opposite sides thereof for the reception of the handle to open and close said later-mentioned section and to lower and raise the pan to and from said supporting-ring, substantially as set forth.

702,526. SWEETEN-FURNACE. ALFRED J. ABE, Peterborough, England. Filed Feb. 2, 1902. Serial No. 92,572. (No model.)

Claim.—1. A sweetening furnace for refining hard sugar comprising an inclined liquation-bed, a fire-grate discharging hot products of combustion into direct contact with said liquation-bed, said inclined liquation-bed having an unobstructed lower edge and a plurality of refining and collecting pins adjacent to said lower edge, substantially as described.

2. A sweetening furnace comprising a plurality of refining and collecting pins, an inclined liquation-bed sloping downwardly to said pins, a fire-grate adjacent to the elevated end of said liquation-bed and discharging hot products thereon and a second fire-grate separated from said first-mentioned grate and discharging its products directly into proximity to the pins, substantially as described.

702,527. TRACE-FASTENER. THOMAS A. BAKER, De Soto, Wis. Filed Aug. 28, 1901. Serial No. 73,005. (No model.)

Claim.—1. A trace-fastener, comprising a body portion, a grooved head formed thereon, an arm pivoted near one end in said groove and notched in its upper face, and a spring interposed between the upper wall of said groove and the notched portion of said arm, whereby said arm is adapted to have its free end normally projecting beyond said groove but may be pressed into the same until its upper face lies in contact with said upper face of the groove, the notch of said arm including said spring, and the under face of the arm lying flush with the under face of said head, the said groove being thereby substantially wholly filled, substantially as described.

2. A trace-fastener, comprising a body portion, a longitudinally-grooved head, an arm movable within said groove, means pivotally securing said arm near one end thereof, whereby the free end of said arm is adapted to normally project beyond the side walls of said groove, while

the opposite end, beyond said pivot is designed to contact with the upper wall thereof for limiting the outward movement of said free end, substantially as described.

3. A trace-fastener, comprising a body portion, a grooved head formed thereon, an arm pivoted at one end within said groove, a notch being formed in said arm, a lug projecting inwardly from the base of said notch, a coiled spring interposed between said arm and the upper wall of said groove, and having its lower end surrounding said lug, whereby the said spring is prevented from lateral movement, and means for preventing the notched portion of said arm from being exposed beyond the wall of said groove, substantially as described.

702,528. COIL-SPRING WEED-HOOK. GEORGE T. BAPPE, Nevada, Mo. Filed Apr. 2, 1902. Serial No. 101,128. (No model.)

Claim.—1. A weed attachment for cultivators, comprising a post adapted to be held to the beam of a cultivator and vertically adjustable, and a coil-spring having a flexible end held to said post, as set forth.

2. An attachment for cultivators comprising a vertically-adjustable post, a coil-spring detachably held upon the end of said post and having a flexible arm adapted to project at right angles from the post, as set forth.

3. In combination with a cultivator-beam, a perforated post, a plate carried by the beam, and the bolt passing through said bolt, plate and beam, a jaw mounted upon said post, and a coil-spring about the lower end of said post, and held thereto by said jaw, an end of said spring being bent to form a flexible arm at right angles to the post, as set forth.

702,529. APPARATUS FOR SUPPLYING AIR AND HYDROCARBON. WILLIAM H. RUBY, Los Angeles, Cal., assignor of two-thirds to John H. Rust and Ezra Spet, Quincy, Ill. Filed June 2, 1901. Serial No. 62,907. (No model.)

Claim.—1. The combination with a main air reservoir and compressor and a burner; of fuel-supplying means including a liquid-fuel reser-

error, auxiliary air-supplying means for supplying air to said burner, means for heating the air supplied from said auxiliary means, steam-supplying means, means for controlling the flow of air and steam to the burner, means for cutting off communication between the main air-reservoir and the main air-compressor and establishing communication between said reservoir and the auxiliary air-supplying means, and means for cutting out the said heating means, substantially as described.

2. The combination with a main air-reservoir and compressor; of an auxiliary compressor, an auxiliary air-reservoir in communication with the auxiliary compressor, a drum receiving the exhaust-steam from said auxiliary compressor, a burner, an air-supply pipe heated by the drum and extending between the auxiliary air-reservoir and burner, a short-circuiting connection between the auxiliary reservoir and air-supply pipe, a connection between the air-pipe and main reservoir, and valve controlling the flow of air through said pipe and connections, substantially as specified.

3. The combination with a main air-reservoir and compressor; of an auxiliary air-compressor, an auxiliary air-reservoir in communication with the auxiliary compressor, a burner, a heating-drum, a steam-exhaust pipe leading from the compressor to said drum, an air-conducting pipe for conveying air from the compressor to the burner and passing through said drum, a short-circuiting connection between the compressor and the air-conducting pipe whereby the air may be caused to pass from said compressor to the pipe without passing through the drum, and valve for controlling the flow of air through the pipes, substantially in the manner set forth.

4. The combination of an air-compressor, a burner, oil-supplying means including an oil-reservoir for the burner, a heating-drum, a steam-exhaust pipe leading from the compressor to said drum, an air-conducting pipe for conveying air from the compressor to the burner and passing through said drum, a short-circuiting connection between the compressor and the air-conducting pipe whereby the air may be caused to pass from said compressor to the pipe without passing through the drum, and valve for controlling the flow of air through the pipes, substantially in the manner set forth.

5. In a hydrocarbon-fuel feed for burners, the combination of a burner and oil-supply tank, a pipe leading therefrom to the burner, an air-compressor, an air-tank connected thereto, a heating-drum receiving the exhaust-steam from the compressor, an air-supply pipe leading to the burner and connected with the air-tank and heated by the drum, a short-circuiting pipe between the air-tank and the air-conducting pipe, an air-blend connection between said air-conducting pipe and the oil-conducting pipe, and valve for controlling the flow of air and oil through the several pipes, substantially as described.

6. In a hydrocarbon-fuel supply, the combination of an air-compressor, a storage-tank connected therewith, a burner, a pipe for conducting the air from the tank to said burner, a heating-drum heated by the exhaust-steam from the compressor and adapted to heat the air passing through said pipe, and a short-circuit connection whereby the air may be conducted to the burner without being heated by said heating device, substantially as specified.

7. In a hydrocarbon-fuel feed, the combination with a main air compressor and reservoir; of a burner, means for supplying steam to the burner, an auxiliary air-compressor, an auxiliary air-reservoir, a hydrocarbon-fuel tank, means for supplying oil from the tank to the burner, means for conducting oil from the tank to the burner, means for regulating the supply of oil, air and steam to the burner, and means whereby in case of injury to the main air-compressor, air from the auxiliary compressor may be supplied to the main air-reservoir, substantially as specified.

8. In a hydrocarbon-fuel feed, the combination of a burner, means for supplying steam thereto, an air-compressor, an air-reservoir supplied therewith, a hydrocarbon-fuel tank, a pipe for conveying air from the air-reservoir to the burner, a pipe for conducting oil from the hydrocarbon-fuel tank to the burner, a heating device for heating the air passing through the air-supply pipe, means for regulating the supply of steam, air and oil to the burner, a short-circuiting connection in the air-supply pipe whereby the air may be caused to pass therethrough without being heated by said heating device, and a connection between the said air-supply pipe and oil-supply pipe, whereby a blast of air may be supplied to the latter-named pipe for freeing the same from obstructions, substantially as described.

702,580. BUSH. June 7, 1901. Serial No. 81,142. (No model.)

Claim.—1. A brush having the holder provided with a projecting tongue, two brush-sections which are secured to opposite sides of said tongue, each of said sections comprising a metal ferrule, a mass of bristles

which are arranged therein, and a series of nails which are driven through one side of each ferrule and clamped on the opposite side thereof to clamp the respective sides of the bristles upon the bristles which they inclose.

2. A brush having the holder provided with a projecting tongue, brush-sections which are arranged on opposite sides of said tongue, each of said sections consisting of a metal ferrule having a mass of bristles which is inclosed thereby, means for clamping the sides of the ferrule about the bristles, a plate having a series of transversely-projecting teeth, which is secured to said tongue, said teeth projecting over the edges of the ferrule opposite the holder and holding said sections against the head thereof, and means for securing said sections to the sides of said tongue.

3. A flat brush having the holder provided with a rectangular-shaped tongue at the end of its head, two brush-sections which are secured to opposite sides of said tongue, said sections each comprising a metal ferrule having the bristles arranged therein, means for clamping the sides of each ferrule about the bristles, the opposite ends of said ferrules being bent transversely about the ends of said tongue and meeting so that the bristles which are clamped within said ends will meet to form a substantially continuous end for the brush.

4. A brush having its holder provided with a tongue which is shaped to correspond with the desired shape of the brush, brush-sections which are secured to opposite sides of said tongue, and a series of transversely-projecting teeth which are secured to the end of said tongue and penetrate and subdivide the mass of bristles on each side thereof.

5. A flat brush having two flexible metal ears which are secured to opposite ends of the head thereof and extend along the ends of the mass of bristles comprising the brush, said ears being adapted to be bent into various positions to vary the width of the brush at its working end.

6. A brush comprising a head, two oppositely-arranged brush-sections, each of which comprises a metal ferrule and a mass of bristles which are clamped thereby, means for pressing said sections together, a securing-plate which is arranged between said sections and is provided with projecting teeth which extend over the edges of said ferrules, and means for securing said plate to said head.

7. A brush comprising a holder, two brush-sections, each of which comprises a metal ferrule and a mass of bristles which is clamped thereby, and means for securing said sections together and to said holder.

702,581. SOAP CAKE. WALKER E. DOWNS, San Francisco, Cal. Filed Aug. 27, 1901. Serial No. 73,444. (No model.)

Claim.—1. A cake of soap provided with a disked metallic plate having a flanged edge embedded in the material of the soap, said plate cooperating with the cake of soap to form an air-chamber therebetween, substantially as and for the purpose described.

2. A cake of soap provided with a guard-plate having a hollow interior secured exterior thereof and constituting an air-chamber, substantially as and for the purpose described.

3. A cake of soap provided with a guard-plate having a hollow interior secured exterior thereof and constituting an air-chamber, and means separating said chamber from the soap, substantially as and for the purpose described.

702,582. NON-REFILLABLE BOTTLE. FRANKS J. BRACONIER, St. Germain, France. Filed Jan. 24, 1902. Serial No. 91,099. (No model.)

Claim.—A non-refillable bottle comprising a stop-valve *a*, a ball *b* and guide-ring *c* for receiving the valve when the bottle is held vertically or substantially so, an obturator *d* above the valve, ball and ring, a frame

a carrying all the said parts and having also, openings *b* for the passage of the liquid, a cork, washer *e* within the neck of the bottle engaging the said frame *a*, a ring *f* engaging the top of said frame and strips *g* connected with said ring and secured to the outside of the bottle, substantially as described.

702,588. GRATE FOR HIDE-TANK. ALFRED BARNET, Leipzig, Austria, Germany. Filed June 12, 1901. Serial No. 84,973. (No model.)

Claim.—1. In combination with a hide-tank, a folding lattice supported thereon and arranged to extend along the side board with means for adjustably holding the free end of the lattice to the side board, substantially as described.

2. In combination with a hide-tank, a folding lattice at both the head and foot, and means for holding the free ends of said lattices to the side board, adjustably, said means being located substantially midway of the side board whereby an opening may be left at the center of the side board, substantially as described.

3. In combination with the hide-tank a folding lattice at both the head and the foot, rods at the free ends of the lattices and a plate secured to the hide-tank having a plurality of loops or eyes to receive the lower ends of the rods substantially as described.

702,584. SYSTEM AND APPARATUS FOR FACILITATING THE ASCENT OF STAIRS OR INCLINED WAYS. LOUIS BARNESMAN, Gillingham, England. Filed Sept. 2, 1901. Serial No. 74,854. (No model.)

Claim.—1. In an apparatus for facilitating the ascent of stairs and inclines, a suitable guiding-support, a part to be grasped by the hand adapted to reciprocate back and forth on said guiding-support, a power-propelling-band, means for operating it in either direction, a device for connecting and disconnecting the movable part with the band, substantially as described.

2. An apparatus for facilitating the ascent of stairs and inclines comprising in combination: a movable part to be grasped by the hand which is permanently connected to a motor; means for starting the motor, means for automatically reversing the motor to return the movable part to its original position, and means for automatically stopping the motor when the original position is reached.

3. An apparatus for facilitating the ascent of stairs and inclines comprising in combination: a movable part to be grasped by hand; a cylinder containing a piston operated and controlled by fluid-pressure, the piston being connected to said movable part; means for admitting discharging and controlling flow of fluid to and from the said cylinder; means for reversing the direction of the fluid-flow to return the piston and the movable part to its original position, and means for automatically stopping the piston when the original position is reached.

4. An apparatus for facilitating the ascent of stairs and inclines comprising in combination a movable part to be grasped by hand; a cylinder containing a piston operated and controlled by fluid-pressure, the piston connected to the said movable part by a flexible band which passes over pulleys and is stretched by them; means for varying the tension of the band controlled from the movable part grasped by hand whereby the centers of the pulleys are caused to vary their distance from each other; means for operating the valves controlling the motive fluid by the change of position of the pulleys whereby the rate of motion of the piston is varied as desired; means for reversing the direction of the fluid-flow to re-

turn the piston and the movable part to its original position, and means for automatically stopping the piston when the original position is reached.

5. An apparatus for facilitating the ascent of stairs and inclines comprising in combination: a movable part to be grasped by the hand, a cylinder containing a piston operated and controlled by fluid-pressure, the piston being connected to said movable part, means for admitting and discharging the flow of fluid to and from said cylinder, means whereby the amount of flow of motive fluid may be controlled by the person using the apparatus, and means for reversing the direction of the flow of fluid to return the movable part to initial position.

6. In an apparatus facilitating the ascent of stairs or inclines, (a) a tractor, (b) a motor-cylinder fitted with a piston, (c) a flexible band or cord, (d) a movable forward pulley and a stationary rearward pulley around which the flexible band or cord passes, (e) means for counterbalancing the pull upon the handle or tractor which means comprise a compound valve for controlling the distribution of motive fluid to and from the forward end of the motor-cylinder and a cylinder which communicates with the forward end of the motor-cylinder and contains a piston which serves as a support or abutment to the movable pulley, substantially as described.

7. An apparatus for facilitating the ascent of stairs and inclines comprising a motor cylinder and piston, a handle or tractor, a flexible connector between the said piston and the said handle or tractor which flexible connector passes around movable and stationary pulleys, means for counterbalancing the pull upon the handle or tractor, and means whereby a force additional to and independent of the pull on the handle or tractor may be applied by the user through the connector to the movable pulley thereby admitting motive fluid to the upper end of the motor-cylinder so as to increase the pressure therein which pressure (being unbalanced by the pull on the handle or tractor) will cause movement of the motor-piston and upward movement of the handle or tractor according to the requirements of the user, substantially as described.

8. In apparatus of the kind hereinbefore referred to, the combination of a slotted guide, a slide mounted thereon, a handle hinged to a portion of the said slide which projects through the said slot, and a cover band or tape which extends in the form of a wave over the said projecting portion of the slide and through the slide in such wise as to protect the working parts of the apparatus from dirt, dust and insects, substantially as described.

9. In apparatus of the kind hereinbefore referred to, the combination of a guide, a slide mounted thereon, a handle hinged to the said slide, a fixed rack, and a non-return pawl which is brought into its operative position relatively to the said rack by the turning of the handle into the position for use, substantially as described.

10. For facilitating the ascent of stairs and inclines, apparatus comprising a handle or tractor which is arranged to slide on a guide more or less parallel to the stairs or incline, and is attached by a flexible connector to a piston working in a cylinder, characteristic features of the arrangement being that the said handle or tractor is hinged in such a manner that by raising it the device controlling the distribution of motive fluid to the two ends of the cylinder will be brought from its mid or central position to such a position as to just open the admission-valve to the upper end of the cylinder, whereas the fall of the handle or tractor will permit the movement of the said controlling device into such a position that motive fluid will be admitted to the lower end of the motor-cylinder and the handle or tractor will then be caused to travel downward along the guide until stopped, and a further characteristic feature being that the said handle or tractor is provided with means whereby, at all parts of its travel, the distribution of motive fluid to and from the cylinder can be controlled by the user to suit his or her requirements.

11. In apparatus of the kind hereinbefore referred to, means for stopping the descent of the handle or tractor comprising a bar having a cam-surface adapted to so act on a lever as to increase the tension of the flexible connector and bring the device which controls the movement of the distribution-valve to its mid or central position substantially as described, whether such bar be fixed at the bottom of the guide, or be movable at intermediate points thereof.

12. In apparatus of the kind hereinbefore referred to, a compound fluid-pressure-regulating valve which comprises admission and release valves whereof the former can be opened and the latter closed by a hand which is capable of variation at the will of the user, the arrangement being such that the loads on the admission and release valves of the compound valve are equal, substantially as described.

13. In apparatus of the kind hereinbefore referred to, an automatic stop-valve interposed between the motive-fluid supply and the admission valve of the apparatus, for the purpose of preventing leakage when the apparatus is not in use; the relief-valve which regulates the opening and closing of the said stop-valve being adapted to be opened to allow the stop-valve to also open only when one or other of the admission-valves is about to be opened, substantially as described.

14. In apparatus of the kind hereinbefore referred to, a slide having a handle or tractor hinged thereto and provided with connections to the ends of the flexible connector between it and the piston of the motor-cylinder and means for tightening the said connector, the construction, arrangement and operation being substantially such as described and illustrated.

702,585. WASHING-MACHINE. LEONARD R. BROOKS, Independent, Iowa. Filed Feb. 26, 1902. Serial No. 96,763. (No model.)

Claim.—In a washing-machine, the combination of a clamp provided with means for engaging the upper portion of a tub and having an upwardly-extending threaded socket, an upright pintle-rod provided with threaded ends, the lower end being arranged within the threaded socket of the clamp and rigidly connected therewith, the approximately U-shaped support provided at its rear leg with upper and lower bearing-plates having inner and outer openings and arranged adjacent to the upper and lower ends of the pintle-rod and receiving the latter in the outer openings, the rear leg of the support being arranged in the inner openings and the bearing-plates being fixed to the said leg, a nut arranged on the upper end of the pintle-rod and engaging the upper bearing-plate, a clip mounted on the front leg of the support, an operating-lever fulcrumed on the clip, an oscillating bar pivoted to the clip and arranged parallel with the lever, a pounder-receiving clamp connected with the bar and with the lever, and a spring for raising the clamp, the lever and the bar, substantially as described.

702,586. WATER-CLOSET. WILLIAM BENTLEY, Jr., Brookline, Mass. Filed Aug. 2, 1901. Serial No. 70,708. (No model.)

Claim.—1. A water-closet of the character described, comprising a bowl having a discharge-passage which leads rearwardly from the bottom thereof, said bowl being provided with a substantially vertical face on its rear side which completely surrounds the end of said passage, laterally-extending walls on each side of the bowl, the rear surfaces of which are continuous with said face, rearwardly-extending walls which extend from said laterally-extending walls beyond said face and from the rear side of the bowl above said face to the floor-line and which unite into a continuous wall to form a chamber which is completely closed except at

the bottom, said laterally-extending walls being provided with apertures which pass through to said chamber from the outside, all of said parts being formed of one integral piece of earthenware, for the purpose set forth.

2. A water-closet of the character described, comprising a bowl having a discharge-passage which leads rearwardly from the bottom thereof, said bowl being provided with a substantially vertical face on its rear side which completely surrounds the end of said passage, laterally-extending walls on each side of the bowl, the rear surfaces of which are continuous with said face, rearwardly-extending walls which extend from said laterally-extending walls beyond said face and from the rear side of the bowl above said face to the floor-line and which unite into a continuous wall to form a chamber which is completely closed except at the bottom, said laterally-extending walls being provided with apertures which pass through to said chamber from the outside, all of said parts being formed in one integral piece of earthenware, a metal siphon-pipe which is located in said chamber and is adapted to be connected to a soil-pipe at its outlet end, a vertically-arranged flange which is securely connected to the opposite end of said pipe and is provided with apertures which register with the apertures of said laterally-extending walls when the inlet end of said pipe registers with the end of said discharge-passage, a packing which is interposed between said flange and face, and bolts which pass through said apertures and are adapted to clamp said packing between said face and flange, said bolts being adapted to be tightened from the outside, for the purpose set forth.

3. A water-closet of the character described, comprising a bowl having a discharge-passage which leads rearwardly from the bottom thereof, said bowl being provided with a substantially vertical face on its rear side which completely surrounds the end of said passage, laterally-extending walls on each side of the bowl, the rear surfaces of which are continuous with said face, rearwardly-extending walls which extend from said laterally-extending walls beyond said face and from the rear side of the bowl above said face to the floor-line and which unite into a continuous wall to form a chamber which is completely closed except at the bottom, said laterally-extending walls being provided with apertures which pass through to said chamber from the outside, all of said parts being formed in one integral piece of earthenware, a short metal siphon-pipe which is located in said chamber and is adapted to be connected to a soil-pipe at its outlet end, a vertically-arranged flange which is securely connected to the opposite end of said pipe and is provided with a series of projecting bosses on its front face, said bosses being provided with screw-threaded apertures which register with the apertures of said laterally-extending walls when the inlet end of said pipe registers with said outlet-passage, a sheet packing of rubber, or other suitable material, which is provided with apertures and recesses in which said bosses are located, and bolts which are adapted to be screwed into said bosses from the outside and clamp the packing between said plate and face, for the purpose set forth.

702,587. CURTAIN-FIXTURE. JONAS BURLY, Baltimore, Md. Filed Aug. 2, 1902. Renewed Nov. 30, 1901. Serial No. 94,546. (No model.)

Claim.—In a curtain-fixture, the combination with a perforated base provided with a casing, the outer wall of which is corrugated longitudinally on its outer face and slotted in the direction of the corrugations, a bracket which has its base corrugated transversely upon its inner face and provided with a slot at right angles to the corrugations, a nut in the casing of substantially the same area in cross-section as the cross-section of the casing and a screw passed through the slot in the bracket and the casing and engaging with said nut, said nut being of a greater thickness than the height of the corrugations, whereby the bracket may be adjusted vertically without removing the screw from the nut.

702,588. INCLINED GRATE FOR AUTOMATIC STOKING. HENRY R. CAMPBELL, Cleveland, Ohio. Filed July 2, 1900. Serial No. 866,113. (No model.)

Claim.—In furnace-grates, a set of fixed grate-bars A arranged in pairs and a set of movable grate-bars B arranged in pairs and alternating with the said fixed bars, both said bars A and B having horizontal shelves which extend laterally to the next adjoining bar on each side, the shelves of the movable bars interlocking with those of the fixed bars, and the shelves of all the bars extending out beyond the upper surface of the bars and forming projections thereon, all the bars being supported in an

inclined position, and means to impart movement to the movable bars in a substantially horizontal direction, substantially as described.

702,589. VEHICLE-TIRE. FREDERICK K. CHRISTENSEN, Study, Utah. Filed Apr. 7, 1902. Serial No. 101,729. (No model.)

Claim.—In a tire, the combination with the air-tube, of an armor secured thereto, said armor having transverse ribs having aligning slots through their central portions, and circumferential ribs spaced laterally from the central line of the tire, the circumferential ribs projecting beyond the transverse ribs at the points upon the armor at which they lie and lying inwardly of the tire from the middle portions of the transverse ribs.

702,540. RECLINING-CHAIR. JAMES W. CLARK and ELMER A. CLARK, Janesville, Wis. Filed Nov. 18, 1901. Serial No. 82,706. (No model.)

Claim.—1. In a chair, the combination with the frame comprising spaced cross-pieces and the back pivoted thereto, a slide embracing opposite sides of the said cross-pieces and connected with the chair-back and provided with cog-teeth, and a pawl connected with the frame and adapted to cooperate with the said teeth to secure the slide and chair-back in a given position, substantially as specified.

2. In a chair, the combination with the frame, a pivoted back, a vertically-adjustable seat, a slide mounted for rectilinear movement and connected with the said back for simultaneous action therewith and having an inclined portion upon which the seat rests to move up or down as the slide is shifted either forward or backward, and means cooperating with the slide to hold it and the seat and back in an adjusted position, substantially as specified.

702,541. ORE-CONCENTRATOR. LOUIS COMES and JOHN GROSS, San Francisco, Mexico. Filed Sept. 11, 1901. Serial No. 73,097. (No model.)

Claim.—1. The combination in an ore-concentrator of a plurality of bed-sections and a single axis passing through the meeting ends of said sections and conjoining the sections whereby the pitch and inclination of the sections may be simultaneously varied, rollers upon the sections, endless concentrating surfaces supported upon said rollers and extending continuously over the bed-sections, and means for simultaneously moving the conjoined ends of the sections and varying the inclination of the sections in relation to each other.

2. The combination in an ore-concentrator, of a plurality of conjoined bed-sections, rollers upon these sections, a belt passing over said rollers and conforming to the pitch or inclination of said sections, a second belt lying upon and inclining said first-named belt, and means whereby the pitch or inclination of said sections may be varied.

3. In an ore-concentrator, the combination of a plurality of aligned bed-sections having rollers and sections having their meeting ends directly conjoined; a plurality of endless traveling belts, one within and supporting the other said belts passing over said bed-sections; and means whereby said belts and bed-sections may be moved in a vertical plane and a double inclination be given the continuous face of the concentrating surface.

4. In an ore-concentrator, the combination of two aligned bed-sections having their adjacent ends pivotally connected, pivotal supports for their outer ends, one of said sections longer than the other, a traveling belt adapted to be supported upon and inclined by said sections, and a second or concentrator belt supported upon and inclining said first-named belt.

5. A concentrator consisting in combination of two horizontally-disposed bed-sections having their ends pivotally supported, means by which said sections may be moved so as to change their relative angles of inclination, rollers upon said sections, an endless belt supported upon said rollers and having its upper surface conforming to the inclination of said sections, a second belt supported upon and inclining said first-named belt, means by which said belts are driven in unison, lateral guides upon the outer belt and sheaves having grooves in which said guides are adapted to travel.

702,542. PLIERS. ISAAC A. COOK, Elmenville, N. Y. Filed May 22, 1902. Serial No. 17,867. (No model.)

Claim.—1. As an article of manufacture a pair of pliers comprising a member provided with a jaw and having an opening therethrough at the rear of the jaw, a second member reduced transversely and passed through the opening in the first member, and having a jaw beyond said reduced portion, plates removably secured in the reduced portions of the second member at the opposite side of the first member from the jaw of the second member, to be flush with the sides of the first member, and a pivot-pin engaging the members.

2. A pair of pliers comprising a member provided with a jaw and a lateral projection at the base of the jaw, and a blade mounted upon the lateral projection and extending in the same direction as the jaw, said blade terminating short of the outer end of the jaw.

702,543. WIRE-STRETCHER. ALFRED CROSS OF ALBERT, Mitchell, Okla. Filed Oct. 14, 1901. Serial No. 73,908. (No model.)

Claim.—1. In a wire-stretcher, a frame, a windlass having integral heads and terminal journals mounted in the said frame, and having a longitudinal slot, the heads having a portion toothed and one of the heads having integral ratchet-teeth, an operating-shaft journaled at its ends in the said frame and provided at or near its ends with pinions in mesh with the toothed portions of the windlass-heads, a pawl cooperating with the said ratchet-teeth, a fixed and a movable grip, and a cord having one end passed through the longitudinal slot of the windlass and its other end attached to the movable grip, substantially as described.

2. A wire-stretcher, comprising longitudinal bars offset between their

terminals, and bars of different lengths joining the longitudinal bars and having their extremities recessed to receive them, the shorter bar being centrally apertured, and the longer bar having an integral lug, a cam-lever fulcrumed on the longer bar for cooperation with the lug thereof, a windless journaled between the more widely spaced longitudinal frame-bars, and a movable grip connected with the windless by means of a cord or rope which passes through the opening in the shorter end frame-bar, substantially as specified.

702,544. ELECTRIC BATTERY. PHILIPPE DELAPOR, Paris, France. Filed Apr. 2, 1900. Serial No. 11,261. (No model.)

Claim.—A dry electric battery comprising a suitable casing, a carbon element therein comprising a carbon plate or rod with binoid of manganese encircling the same and an insulating wrapper retaining the same in position, an annular zinc element, having openings, and an electrolyte composed of chlorid of zinc and an inert material on both sides of said zinc element, substantially as described.

702,545. RAILWAY SWITCH. STEPHEN A. DOUGLAS, Leavenworth, and MELVIN ALGER, Leavenworth county, Kans. Filed Dec. 10, 1901. Serial No. 85,322. (No model.)

Claim.—A switch comprising a movable frog-point 1, a frog-plate 21 having upwardly-struck transverse ribs supporting said frog-point, a rod 6 secured to said point and passing through the wing-rails, a bell-crank lever 7 connected to said rod, a rod 9 having one end connected to said bell-crank lever, a switch-stand, a bell-crank lever 12 adjacent thereto, and connected to the opposite end of said rod 9, a switch-arm 16, a link 15, connecting said switch-arm to bell-crank lever 12, and a

rod 17 connected to said link, substantially as and for the purpose described.

702,546. PRINTING PRESS. ARTHUR E. DOWELL, Washington, D. C., assignor, by mesne assignments, to Detroit Trust Company, Trustee, Detroit, Mich., a Corporation of Michigan. Filed Sept. 20, 1901. Serial No. 75,941. (No model.)

Claim.—1. In a printing-press, the combination of web-forwarding mechanism a web-looping roller, a vibrating lever for operating said looping-roller, a cam for operating said lever, and a fulcrum for said lever adjustable to and from the cam whereby the extent of vibration of both lever and looper may be regulated, substantially as described.

2. The combination of changeable-speed web-forwarding mechanism a web-looping roller, a vibrating lever operating the looping-roller, a cam for vibrating said lever, and an adjustable fulcrum below and directly engaging the under side of the lever and adjustable to and from the cam whereby the throw thereof produced by the cam and the throw of the looping-roller may be varied, substantially as described.

3. The combination in a printing-press, of web-feed rollers, a looping-roller adapted to take up the web fed in by the feed-rollers during an impression, a pivoted lever for operating the looping-roller, a second pivoted lever for operating the first pivoted lever, an adjustable fulcrum between the first and second levers, and means for vibrating the second lever, substantially as described.

4. The combination in a printing-press of web-feed rollers and means for changing their speed, a looping-roller adapted to take up the web fed in thereby during an impression, a pivoted lever for operating the looping-roller, a second pivoted lever and an adjustable fulcrum thereon for operating the first pivoted lever, and means for vibrating the second lever, substantially as described.

5. The combination of continuously-operating changeable-speed web-feed rollers, a movable looping-roller for giving an intermittent movement to the web, a vibrating lever for operating the looping-roller, a cam for actuating said lever, and an adjustable fulcrum for said lever adjustable to and from the cam whereby the throw of the lever and connected looping-roller may be changed in accordance with the changed speed of the feed-rolls, substantially as described.

6. In a printing-press, the combination of the continuously-operating web-feed rollers, means for changing the speed of said rolls, a movable looping-roller for the web, a vibrating lever for operating the looping-roller, a second vibrating lever below the first lever, a cam for actuating said second lever, and an adjustable fulcrum on the latter lever engaging the first lever whereby the throw of the looping-roller may be changed in accordance with the changed speed of the feed-rolls, substantially as described.

7. In a web-printing press, the combination of means for continuously feeding a web, a vibrating looping-roller cooperating with the feed devices in handling the web, a vibrating lever for operating the looping-roller and a cam for operating said lever; with means for changing the speed of the feed devices and a fulcrum for the lever adjustable toward and from the cam whereby the extent of the vibration thereof can be changed to compensate the movement of the looping-roller for the changed speed of the feed-rollers, substantially as described.

8. The combination of continuously-acting rolls for moving a web of paper, and a movable looping-roller for causing an intermittent movement of part of the web, a vibrating lever for actuating the looping-roller and a cam for operating said lever; with means for changing the speed of the rolls, and a fulcrum for the lever adjustable to and from the cam whereby the extent of the vibrations imparted thereto by the cam may be varied to compensate the movement of the looping-roller for the changed speed of the feed-rollers, substantially as described.

9. In a web-printing press, the combination of continuously-acting rolls for moving a web of paper, and a movable looping-roller for causing an intermittent movement of part of the web, a vibrating lever for actuating the looping-roller; with a second uniformly-vibrating lever, and an adjustable fulcrum thereon for actuating the first lever therefrom whereby the vibrations of the first lever may be varied to compensate the movement of the looping-roller for any change of speed of the feed-roll, and means for changing the speed of the feed-roll, substantially as described.

10. The combination in a printing-press of changeable-speed web-feed rollers, a looping-roller adapted to give up a loop of web to the feed-rollers during an impression, a lever for operating the looping-roller, and an adjustable fulcrum for said lever whereby the extent of vibration of the lever and looper can be regulated in accordance with the speed of the feed-rolls, substantially as described.

11. The combination in a printing-press, of changeable-speed web-feed rollers a looping-roller adapted to take up the web fed in by the feed-rollers during an impression; a lever for operating the looping-roller and an adjustable fulcrum for said lever to regulate the extent of vibration thereof according to the speed of the feed-rolls, substantially as described.

12. The combination of means for continuously feeding a web of paper; a web-looping roller cooperating with the feed devices; means for changing the speed of said devices; a lever for actuating said looper, and a cam for operating the lever, with a fulcrum adjustable to and from the cam for varying the movement of said lever so that it will move the looper in accordance with the speed of the feed devices, substantially as described.

13. The combination of the continuously and synchronously acting feed and delivery rolls, a pair of looping-rollers cooperating therewith to alternately stop and move the intermediate portion of the web, a vibrating lever for operating said looping-rollers and a cam for vibrating said lever; with means for changing the speed of the feed and delivery rolls, and an adjustable fulcrum for the lever whereby the extent of vibration imparted thereto by the cam can be changed so that it will properly move the looping-rollers in accordance with the speed of the feed and delivery rolls.

702,547. FLY-PAPER HOLDER. CARP D. EATON and ALFRED L. HORTON, Allen, Mich. Filed Apr. 16, 1902. Serial No. 105,350. (No model.)

Claim.—1. As a new article of manufacture, a fly-paper holder and protector, consisting of a frame formed of a single piece of wire-netting having the edges turned inwardly and adapted to support the fly-paper out of contact with the frame, substantially as described.

2. As a new article of manufacture, a fly-paper holder and protector, consisting of a frame formed of a single piece of wire-netting having the edges turned inwardly and having upwardly-projecting spurs adapted to engage the fly-paper, substantially as described.

3. As a new article of manufacture, a fly-paper holder and protector, consisting of a frame formed of a single piece of wire-netting having the edges turned inwardly and having some of the ends of the wire forming the netting turned upward to form spurs to support the fly-paper, substantially as described.

4. As a new article of manufacture, a fly-paper holder and protector consisting of a sheet of perforate material having opposite edges turned downwardly and inwardly to form ribs to support the fly-paper beneath and out of contact with the body portion of the sheet.

702,548. VEHICLE-HUB. JOHN E. FOLEY, Pontiac, Mich. Filed Oct. 18, 1901. Serial No. 73,776. (No model.)

Claim.—1. In a vehicle-hub, a wood portion, metallic plugs recessed in said wood portion and tapered to receive a screw, collars encircling said wood portion and the plugs, said collars provided with holes

adapted to register with the holes in the plugs, and screws for engaging the collars with the plugs, substantially as described.

2. In a vehicle-hub, a wood portion, metallic plugs having a screw-threaded engagement with said wood portion, the ends flush with the surface of the wood portion, said plugs tapered to receive a screw, collars encircling said wood portion, and the plugs and provided with holes registering with the holes tapered in the plugs, and screws to engage the collars with the plugs, substantially as described.

3. In a vehicle-hub, a wood portion, metallic plugs recessed in said wood portion and tapered to receive a screw, collars to encircle said wood portion and plugs provided with holes registering with the holes in the plugs, said collars formed with a knife-edge on the inside so as to form a flush joint with the wood and screws to engage the collars to the plugs, substantially as described.

702,549. CHAIN RETAINING AND RELEASE MEANS. JOHN J. GALWAY, Duluth, Minn., assignor of one-half to Kenneth McDonald, Duluth, Minn. Filed Feb. 26, 1902. Serial No. 86,308. (No model.)

Claim.—1. A load-securing mechanism, comprising a load-inclosing means, a bolt secured to said load-binding means, a housing carried by a car or other vehicle having a recess formed therein for receiving the said bolt, means within said housing for locking the bolt therein, and means within the control of an operator standing out of the way of danger for releasing the said bolt, substantially as described.

2. In a chain securing and releasing device the combination with a supporting structure of a housing secured thereto, an eyebolt seated in said housing and provided with a key-receiving slot, a key supported in said housing, comprising a vertical shaft, parallel with said eyebolt, and provided with a horizontal tongue adapted to engage the said key-receiving slot, said housing being provided with an interior chamber adapted to permit the reciprocation of said tongue radially with respect to the longitudinal axis of said shaft, substantially as described.

3. In a chain securing and releasing device the combination with a supporting structure of a housing secured thereto and provided with an interior chamber to permit the radial reciprocation of the tongue of a key, a detachable chain-terminal pin seated in said housing and provided with a key-receiving slot and with chain-attaching means, a key comprising a shaft and an angular tongue, supported in said housing, said tongue being adapted to be radially reciprocated by said shaft with respect to the longitudinal axis of said shaft, and to engage said key-receiving slot, means to operate the said key, substantially as described.

4. In a chain securing and releasing device the combination with a suitable supporting structure of a housing secured thereto and adapted to receive a chain-terminal pin and a key, and provided with an interior chamber to permit the radial reciprocation of said key, a pin seated in said housing and adapted at its outer end to engage a chain and provided intermediate of its ends with a slot adapted to receive a key-tongue having a transversely-radial movement, a key, supported in said housing, comprising a shaft and an angular tongue adapted to radially reciprocate with said shaft about an axis longitudinal of said shaft, and to extend in operative position, into the slot in said pin and in inoperative position to lie wholly within said chamber, a lever mounted on the outer end of said key-shaft, a draw-rod pivotedly secured to the opposite end of said lever, means to support said draw-rod and means to secure the same in operative position against movement, substantially as described.

702,550. STEAM-GENERATOR. JOSEPH L. GIBSON, Jerome, Ariz. Filed Nov. 22, 1901. Serial No. 83,304. (No model.)

Claim.—1. An annular tubular horizontally-disposed steam-generator, and a furnace and means for supplying fuel continuously thereto.

2. An annular tubular horizontally-disposed steam-generator shell, a furnace and means for continuously supplying fuel to the furnace.

3. An annular tubular horizontally-disposed shell having an annular channelled furnace around its periphery, and means for supplying fuel continuously to said furnace.

4. An annular tubular horizontally-revoluble generator having an annular channel-furnace formed around its periphery, means for supplying fuel to said furnace during the revolution of the generator.

5. An annular tubular horizontally-revoluble generator having an inwardly-projecting furnace-channel formed around its periphery, and a raised flange about the bottom of said channel to retain the fuel therein.

6. An annular tubular horizontally-revoluble shell, a furnace consisting of an annular channel formed in the side of the shell adapted to retain a molten or liquid fuel, a passage through which said fuel is admitted, a wall surrounding the shell and forming a closure for the open side of the furnace.

7. A horizontally-revoluble steam-generator having an open channel around its periphery forming a furnace, a wall surrounding the generator in close proximity with the mouth of the furnace, and a flange projecting above the furnace and revoluble in close proximity to the wall to maintain a tight joint.

8. A horizontally-revoluble steam-generator consisting of short tubular sections riveted together, a furnace consisting of a channel opening into the interior around the periphery of the generator, and means for supplying fuel thereto, a wall surrounding the generator and forming a closure for the open mouth of the furnace, and a flange secured above the furnace having a circular periphery turnable in close proximity with the furnace-wall to form a joint therewith.

9. An annular horizontally-revoluble steam-generator having a channelled annular furnace opening inwardly from the periphery, a track and antifrictional supports upon which said shell is borne and mechanism through which power is applied to revolve the shell.

10. An annular horizontally-revoluble steam-generator having an annular channelled furnace opening into the periphery thereof, antifrictional bearings and mechanism whereby the generator is revolved, a centrally-revoluble hub and rods extending radially therefrom having the outer ends fixed to the boiler-shell sections.

11. An annular horizontally-revoluble steam-generator having an annular channelled furnace upon the periphery, means for supplying fuel to said furnace, and means for removing the waste fuel therefrom.

12. An annular horizontally-revoluble steam-generator having an annular channelled furnace extending from the periphery to its interior, means for supporting and revolving the furnace, means for supplying fuel thereto and means for removing waste products therefrom, consisting of a fixed plow projecting into the furnace and the path of travel of the fuel whereby the latter is excavated and discharged.

13. An annular horizontally-revoluble steam-generator having a channelled annular furnace extending from the periphery into the interior, means for supplying fuel and removing waste products therefrom, means for feeding water consisting of a centrally-disposed pipe with branches extending therefrom to the peripheral generator and a turnable joint at the junction of the vertical and movable branches.

14. An annular horizontally-revoluble steam-generator having a channelled annular furnace extending from the periphery into the interior, means for supplying fuel and removing waste products therefrom, steam-pipes leading from the upper part of the boiler to a centrally-located turnable joint and a stationary conducting-pipe connecting with said joint.

15. An annular horizontally-revoluble steam-generator, means for supplying water thereto consisting of a stationary centrally-disposed pipe, pipes connecting said first-named pipe with the boiler, a packed joint turnable in unison with the pipes and forming a connection with the stationary pipe, steam-pipes converging from the upper part of the boiler and a centrally-located joint or coupling with which they connect, and a stationary conducting-pipe having a steam-tight connection with the turnable joint.

702,551. **BRONZING-MACHINE.** GEORGE HARR, Los Angeles, Cal. Filed Aug. 27, 1901. Serial No. 72,484. (No model.)

Claim.—1. In a bronzing-machine, the combination with a plush

fountain-roller; of a sprayer provided with blades to remove the dust from the fountain-roller and to throw it onto the surface which is to receive the same.

2. The combination of the fountain-roller, of a spraying-roller, and means for rotating said spraying-roller at a speed greater than that of the fountain-roller.

3. In a bronzing-machine, a sprayer comprising a barrel furnished with scrapers or blades.

4. A sprayer for a bronzing-machine consisting in heads and blades fastened to said heads to form scrapers for removing the dust from the piles of the fountain-roller.

5. The combination with the cylinder and duster of a bronzing-machine, of an apron having a face located in the path of the dust thrown by said dusters; means for moving the apron; and means for removing the dust from the apron.

6. In a bronzing-machine, a dust-receptacle; a dust-catching apron arranged in the path of the dust, and means for moving said apron to deliver the dust to the dust-receptacle.

7. A bronzing-machine furnished with a removable dust-receiving receptacle; a moving apron to receive the dust thrown by the dusters of said machine; means for moving the apron at one speed; and a dust-brush arranged to brush the face of said apron and to deliver the dust therefrom into said removable receptacle.

702,552. **MALT-KILN.** THOMAS HAYES, JR., Buxton, England. Filed Jan. 27, 1902. Serial No. 61,457. (No model.)

Claim.—The combination with a malt-kiln having a perforated mashing-floor, of a basket or holder for containing an open fire, a casing of conducting material surrounding the basket and having its walls arranged at such distance from the fire as to be out of contact therewith and the flame therefrom, a casing of non-conducting material surrounding the in-

ner casing, air-inlets in said outer casing for admitting air around the inner casing beneath the mashing-floor, and a coiled fire leading upward from the top of the inner casing arranged beneath the mashing-floor and discharging above the malt-level.

702,553. **HYDROCARBON-VAPOR BURNER.** LEO G. HARR, Philadelphia, Pa., assignor of one-half to Charles J. Wilson, New York, N. Y. Filed Oct. 21, 1901. Serial No. 78,270. (No model.)

Claim.—1. In a burner of the character described, the combination with the tubular base, and burner-heads communicating therewith, of a generating-chamber located above the burner-heads, a stem provided with inlet and outlet passages, the latter of which communicates with the tubular base, a trap-chamber establishing communication between the outlet-passages of said stem and the generating-chamber, said inlet-passages communicating with the generating-chamber, and means for controlling the flow of vapor from the generating-chamber to the burner-heads, said means comprising valves, one located in the trap-chamber and the others at the burner-heads and means for simultaneously operating said valves, substantially as set forth.

2. In a burner of the character described, the combination with a semicircular tubular base, provided with burner-heads, of a generating-chamber, a trap-chamber communicating therewith, a stem connecting the generating-chamber and the trap-chamber to the base and provided with inlet and outlet passages, the latter of which establishes communication between the generating-chamber, the trap-chamber and tubular base, said inlet communicating with the generating-chamber, valves arranged to regulate the supply of gas at the burner-heads, a valve arranged to regulate the supply of gas from the trap-chamber, connections between said valves, and means for simultaneously operating said valves, substantially as set forth.

3. In a burner of the character described, the combination with the tubular base provided with a burner-head and with a valve-seat, means for supplying gas to said tubular base, a bar mounted to move vertically in said tubular base, a valve loosely seated on said bar and provided with a chamber in its side, a headed stud projecting upwardly from said bar into said chamber, and a stud projecting laterally through the side wall of the valve within the path of movement of the head of the first-named stud so that in the downward movement of said bar, the first-named stud will engage the second-named stud and pull the valve from engagement with its seat, substantially as set forth.

4. In a burner of the character described, the combination with the tubular base provided with a valve-seat and with jet-orifices, means for supplying gas to the tubular base, a bar mounted to move vertically in said tubular base, a valve loosely supported upon said bar to engage said valve-seat and provided with points or needles to engage the jet-orifices, and having formed on its under side a chamber, a headed stud projecting vertically from said bar into said chamber, and a stud projecting laterally through the side wall of said valve within the path of movement of the head of the first-named stud, substantially as set forth.

5. In a burner of the character described, the combination with the semicircular tubular base, burner-heads communicating therewith, of a generating-chamber located above said burner-heads, a trap-chamber communicating between the generating-chamber, a stem having a passage communicating between the trap-chamber and the tubular base, a vertically-movable valve-stem located in the vertical passage, a curved bar secured to the lower end of the vertically-movable stem and located in the semicircular base, a valve-seat within said trap-chamber, valve-seats at the burner-heads, valves, one supported above the upper end of the vertically-movable stem, and the others above the curved bar, and a shaft provided with an eccentric-pin adapted to work in a slot in the valve-stem to raise and lower said stem to open and close said valves, substantially as set forth.

702,554. **PHOTOGRAPHIC PLATE FOR REPRODUCING INK IMPRESSIONS.** LOUIS C. HENRIOT, Rhodan, France. Filed Oct. 25, 1901. Serial No. 50,361. (No specimens.)

Claim.—1. An emulsion for the purpose specified composed of a mixture of gelatin, mercuric bromide, and potassium bichromate, substantially as described.

2. The herein-described process of preparing sensitive coating material, which consists in dissolving a mixture of mercuric nitrate and potassium bromide in a solution of gelatin, and adding nitric acid until a milky-white substance is formed, substantially as described.

702,555. **TYPE-DISTRIBUTING MACHINE.** JOSEPH BARKLEY, Frankfurt-on-the-Main, Germany, assignor to Fritz Levy, Frankfurt-on-the-Main, Germany. Filed Dec. 26, 1901. Serial No. 57,631. (No model.)

Claim.—1. In a type-distributor, the combination of a carriage for supporting the type to be distributed, a hopper to receive the detached type, a plunger to detach the type, a series of keys corresponding to the type to be distributed, a series of channels below the hopper, also corresponding to the types to be distributed, mechanism actuated by any key of the series for operating the plunger, and mechanism actuated by the respective keys for moving the hopper to register with the channel corresponding to the key which is moved, substantially as set forth.

2. In a type-distributor, the combination of means for detaching the type, a hopper to receive the detached type, a series of channels, corresponding with the types to be distributed, into which the hopper may discharge, a series of keys also corresponding to the types to be distributed, and mechanism actuated by the respective keys for moving the hopper to register with the channel corresponding to the key depressed, substantially as set forth.

3. In a type-distributor, the combination of means for detaching the type, a hopper to receive the detached type, a series of channels corresponding with the types to be distributed, and into which the hopper may discharge, a series of keys also corresponding to the types to be distributed, and mechanism actuated by the keys for imparting a rectilinear movement and also an oscillating movement transversely to the rectilinear movement, substantially as set forth for the purpose set forth.

4. In a type-distributor, the combination of means for detaching the type, a hopper to receive the detached type, a series of channels, corresponding with the types to be distributed, and into which the hopper may discharge, a series of keys also corresponding to the types to be distributed, lever mechanism actuated by the keys to impart rectilinear movement to the hopper, and an auxiliary key for shifting the lever mechanism to change the direction of said rectilinear movement of the hopper, substantially as set forth.

5. In a type-distributor, the combination of means for detaching the type, a hopper to receive the detached type, a series of channels, corresponding with the types to be distributed, into which the hopper may discharge, a series of keys also corresponding to the types to be distributed, mechanism actuated by the keys for imparting an oscillating movement to the hopper, and stops controlled by the keys for determining the extent of said oscillating movement, substantially as set forth.

6. In a type-distributor, the combination of a carriage for supporting the type to be distributed, a plunger for detaching a single type, a series of keys, and mechanism actuated by any key of the series for actuating said plunger, substantially as set forth.

7. In a type-distributor, the combination of means for detaching the type, a hopper to receive the type, a series of channels, corresponding with the types to be distributed, into which the hopper may discharge, a series of key-levers also corresponding with the types to be distributed, a lever system connected to the hopper to impart rectilinear movement to the latter, said system being common to all of said key-levers, projections on said key-levers to engage and operate the lever system, said projections

tion being of different lengths on different key-levers, substantially as set forth.

702,556. PULP-WASHING APPARATUS. ALBERT KIMMER, Elmsted Park, Mo. Filed Feb. 27, 1902. Serial No. 26,906. (No model.)

Claim.—1. A washing-tank comprising an inclined trough having parallel rows of chambers, the chambers of each row being in communication with each other through alternate up and down passages, and the end chambers of each of the intermediate rows being in communication with the end chambers of the next adjacent rows at opposite sides of the tank, forming a zigzag passage, substantially as described.

2. A washing-tank comprising an inclined trough having a zigzag longitudinal passage-way consisting of vertical chambers arranged in longitudinal and transverse rows, said chambers being formed of fixed and movable partitions, the fixed partitions in the transverse rows forming underflow and the movable partitions overflow passages, substantially as specified.

3. A washing-tank comprising an inclined trough having a zigzag longitudinal passage-way provided with alternate over and under flow passages, substantially as and for the purpose specified.

4. A washing-tank comprising an inclined trough having a zigzag longitudinal passage-way consisting of vertical chambers arranged in longitudinal and transverse rows, said chambers being formed of fixed and movable partitions, the fixed partitions in the transverse rows forming underflow and the movable partitions overflow passages, means for controlling the inflow and discharge of the pulp and the discharge of the residuum, a water-supply pipe, means for conveying water from said supply-pipe to said chambers, and means for also supplying water from said pipe for flushing the interior of the tank to wash away the residuum, substantially as set forth.

5. A washing-tank having a zigzag passage-way consisting of vertical chambers arranged in longitudinal and transverse rows, said chambers being formed by longitudinal and transverse stationary partitions and longitudinal and transverse movable partitions, the longitudinal stationary partitions forming underflow and the movable partitions overflow passages, said movable partitions being capable of an upward adjustment to also form underflow-passages for the circulation of water along the bottom of the tank, substantially as described.

6. An apparatus of the character described comprising a tank provided with a zigzag passage-way, and a perforate false bottom with passages below the false bottom for the discharge of the waste water, a trough communicating with said passages, valves establishing communication between the passages and trough, and means for supplying water to the trough and passage-way for cleaning the interior of the tank, substantially as specified.

7. In an apparatus of the character described, the combination of a tank provided with chambers forming an irregular or zigzag passage-way for the circulation of the pulp, with means for controlling the inflow and discharge of the pulp and the discharge of the residuum, a water-supply pipe, means for conveying water from said supply-pipe to said chambers, and means for also supplying water from said pipe for flushing the interior of the tank to wash away the residuum, substantially as specified.

702,557. SOUND-PRODUCING DEVICE SUITABLE FOR MACHINES. ED. SUMNER BURN-JONES, Hartford, England, assignor to the Hamilton-Foster Pig Signal Company, New York, N. Y., a Corporation of Connecticut. Filed Nov. 26, 1901. Serial No. 28,726. (No model.)

Claim.—1. The combination with a piston, means for positively operating same by fluid-pressure on both sides, and a surrounding cylinder, of two parts having passages in same, one of said parts being movable, a connection between it and the piston, and a chamber, on one side of said parts containing fluid under pressure adapted to pass through the passage when they coincide the other side of the parts being open to the atmosphere substantially as described.

2. In combination a cylinder having a passage in the walls of same, a chamber for a fluid under pressure on one side of the cylinder, a second chamber to which the cylinder is open on the other side, a piston having a passage in same open to the atmosphere on one side and adapted to correspond with the passage in the cylinder at times for exhaust purposes and a sound-producing device carried by said piston and capable of being vibrated thereby, substantially as described.

3. A sound-producing device comprising a piston-engine, means for positively operating the piston of same in both directions, a vibrating sound-producing device operated by the engine, and a resonator the size of the column of air in which, is adapted to directly modify the periodicity of the engine substantially as described.

4. In a sound-producing device the combination with a resonator and a chamber for a supply of fluid under pressure of a series of passages forming a communication between the resonator and the air-supply, means for opening and closing each series of passages and a piston-engine connected to each means for positively operating same, substantially as described.

5. In a sound-producing device, the combination with a resonator, and a chamber for a supply of fluid under pressure, of a tubular part having a series of passages forming a communication between the resonator and the air-supply, a second part having a similar series of passages, a piston-engine connected to one of these parts to reciprocate same and operated by the fluid from the chamber above mentioned, and stops for limiting the movement of the reciprocating part so that it shall not move so far as to be put out of action when idle, substantially as described.

6. In a sound-producing device and in combination, a resonator, a tubular part having passages therein communicating with same, a cylinder having corresponding passages communicating with a supply of fluid under pressure, a piston carried by the tubular part, in communication with the air-supply, a cylinder for each piston, and suitable air inlet and exhaust passages, substantially as described.

7. The combination with a cylinder having a series of passages therein, a tubular piston having a similar series of passages, a chamber for fluid under pressure surrounding same, a piston 8 carried by the first-named piston, and having an exhaust-passage in same communicating with its periphery and with the tubular part, a second cylinder surrounding the piston 8 having a chamber in same, and a passage adapted to communicate with it and with the chamber for fluid under pressure or the exhaust-passage in the piston.

8. In a sound-producing device, a cylinder having a series of smaller passages, a chamber for fluid under pressure surrounding same, valve 20 connecting the parts of the cylinder between the passages, a second cylinder 3 carried by each valve and having a passage communicating with its interior and the chamber for fluid under pressure, a tubular piston for the first cylinder having a series of smaller passages, valve 13 connecting the parts of the piston between the passages, a second piston 5 carried by the first piston, and having an exhaust-passage adapted to communicate with the passage in cylinder 3 and with its interior, and means for limiting the movement of piston 5 in its cylinder substantially as described.

702,558. ROTARY ENGINE. CARL A. HERR and OSCAR W. HERR, Stockholm, Sweden. Filed Mar. 17, 1902. Serial No. 28,726. (No model.)

Claim.—1. In rotary engine, in combination, equilibrated inlet-valves 26 for controlling the supply of driving fluid, each valve arranged in the rotary working piston 1 of the engine and connected to a controlling-piston 26 movable in the said rotary working piston, passages 19, 20, 21 communicating with the inlet and leading through the working piston 1 to one side of each of the controlling-pistons 26 for the inlet-valves, and passages 4, 5 leading to the opposite side of the controlling-pistons 26, one of said passages 5 communicating periodically with the exhaust, the other passage 4 being put in communication with the inlet after the former passage 5 is shut off from the exhaust, substantially as specified.

2. In a rotary engine, the combination of equilibrated inlet-valves

26 placed in the rotary working piston 1 of the engine for controlling the supply of driving fluid, each valve being connected to a controlling-piston 26 movable in the said rotary working piston, passages 19, 20, 21 communicating with the inlet and leading through the working piston 1 to one side of each of the controlling-pistons 26 for the inlet-valves, a distributing-valve 35 located in the hollow shaft 2 of the rotary working piston and provided at its ends with bores or holes 36, 37 one of which 36 communicates with the inlet and the other 37 with the exhaust, openings 39, 40 in the wall of the distributing-valve 35 leading from each of the bores or holes 36, 37 in the distributing-valve to the outer side of said valve, and passages 4, 5 leading from the outer side of the distributing-valve to the side of the controlling-pistons 26 opposite to that permanently communicating with the inlet, the parts of said passages periodically passing the openings 39, 40 in the wall of the distributing-valve, substantially as specified.

3. In a rotary engine, the combination of equilibrated inlet-valves 26 placed in the rotary working piston 1 of the engine for controlling the supply of driving fluid, each valve being connected to a controlling-piston 26 movable in the said rotary working piston, passages 19, 20, 21 communicating with the inlet and leading through the working piston 1 to one side of each of the controlling-pistons 26 for the inlet-valves, a distributing-valve 35 located in the hollow shaft 2 of the rotary working piston and provided at its ends with bores or holes 36, 37 one of which 36 communicates with the inlet and the other 37 with the exhaust, openings 39, 40 in the wall of the distributing-valve 35 leading from each of the bores or holes 36, 37 in the distributing-valve to the outer side of said valve, passages 4, 5 leading from the outer side of the distributing-valve to the side of the controlling-pistons 26 opposite to the side permanently communicating with the inlet, and a regulator connected to the distributing-valve for controlling the position of same, substantially as specified.

702,559. SOCKET FOR STIKELS OF CORSETS. MRS. WYTHAMER, F. F. HERR, Braintree, Mass., assignor of one-third to Peter W. French, Weymouth, Mass. Filed Oct. 17, 1901. Serial No. 28,726. (No model.)

Claim.—The improved socket for sticks of corsets and dress-stays consisting of a strip of stiff sheet material bent near its middle, curved transversely at the bend and cupped at one side of the bend, substantially as shown.

702,560. OIL-BURNER. WILLIAM R. JEAISON, Cleveland, Ohio. Filed Aug. 18, 1902. Serial No. 27,966. (No model.)

Claim.—1. In an oil-stove, the combination of an oil-supply tank provided with means for the maintenance of a substantially constant level of oil therein, a burner-trough with its top edge above the plane of the maintained oil-level in said tank, a supply-pipe between said tank and trough, and a valve and stem to control the outflow therefrom, and a sleeve for said valve-stem extending upwardly to a plane above the maintained level of oil in said tank and open at its top, the said valve-stem adapted

to be reciprocated in said sleeve, whereby the contents of the oil-passages may be forcibly ejected and the said passages cleaned with the head of oil open to the burner-trough, substantially as described.

2. In an oil-stove, the combination of an oil-supply tank provided with means for the maintenance of a constant level of oil therein, a burner-trough in position with its top edge above the level of oil in said tank, an oil-feed pipe projecting downwardly from said trough and a valve below said feed-pipe controlling the flow of oil to the burner-trough, a supply-pipe for the said trough below said valve, and a sleeve for the said valve extending upwardly to a point above the level of oil in the said tank, said valve adapted to be reciprocated and to serve as a piston to force oil through the oil-passages leading to the burner-trough, substantially as described.

3. The combination of an oil-supply tank and means for the maintenance of a substantially constant level of oil therein, a burner-trough and a valve-body and oil-supply connections from the tank to said body and thence to the burner-trough, a sleeve projecting from said valve-body having its upper end above the maintained oil-level in the tank and a plunger in said sleeve adapted to force oil forward through the oil-passages, substantially as described.

4. The combination of an oil-supply tank and means for the maintenance of a substantially constant level of oil therein, a burner-trough with its top edge above the maintained level of the oil in said tank and a valve-body and oil-supply connections from the tank to said body and thence to the burner-trough, a sleeve projecting from said valve-body having its upper end above the maintained oil-level in the tank and a plunger in said sleeve adapted to force oil forward through the oil-passages, substantially as described.

5. In an oil-stove, the combination of an oil-supply tank and means for the maintenance of a substantially constant level of oil therein, a burner-trough with its top edge above the level of the oil in said tank, and an oil supply passage from the tank to the said burner, a tubular sleeve open to said passage and having its upper end above the maintained level of the oil in the supply-tank, and means adapted to be reciprocated in said sleeve and to force oil to the burner-trough, substantially as described.

6. In an oil-stove, the combination of an oil-supply tank and means for the maintenance of a substantially constant level of oil therein, a burner-trough with its top edge above the plane of the constant oil-level of said oil-supply, a valve-body below said trough and in open connection therewith through an upwardly-extending part, a tube for the valve-stem extending outwardly and upwardly from said valve-body with its top end above the plane of the said constant oil-level, and a valve-stem supported in said tube, said parts constructed and arranged to allow the reciprocation of the valve-stem in the said tube, substantially as described.

7. In a burner, perforated tubes forming a combustion-chamber between them, an annular vapor-trough supporting said tubes, a transversely-arranged oil-supply pipe supporting said vapor-trough and open thereto at its ends, and a heat-radiating plate spanning the space at the bottom of the trough, whereby vaporization of the oil in the vapor-trough is promoted, substantially as described.

702,561. COMBINATION-FLOW ATTACHMENT. WILLIAM A. JEFFERS, Hailberry, Ark. Filed Mar. 7, 1902. Serial No. 27,966. (No model.)

Claim.—1. In a right and left hand cultivator, the combination of a double-fluted-plow stock 1, having its head 2, slotted; a scraper 3, its outer end nearly straight horizontally, its inner end curved forward and

to a greater degree at the bottom; said end and cutting edge curved sharply downward to a point 6, and having the cutting-flange bent forward, forming a collar; said scraper provided near its under end with a circular slot 8, and bolt-holes; a winged stirrer 9, secured to the rear foot and inside of the outer end of said scraper, substantially as shown and described, and for the purposes set forth.

2. In a right and left hand cultivator, the combination of a double-footed-plow stalk 1, having its hook 2, slotted; a scraper, its inner end extending downwardly, forming a point 6, and turning forward forming a collar 5; said scraper provided near its inner end with bolt-holes and a circular slot 8; a right-angle-bar support 7, its two ends coming to a point, its flat side 7', fitting against the face of the forward foot 2, its two edges 7'', and 7''', fitting against the rear face of the scraper, and a stirrer 9, secured to the rear foot 2, and inside of the line of the free end of the scraper, substantially as shown and described and for the purposes set forth.

3. In a right and left hand cultivator, to be used in combination with a double-footed-plow stalk 1, and wheeled cultivator 2; a scraper 3, its outer end nearly straight horizontally, its inner end curved forward and to a greater degree at the bottom; said end and cutting edge curved sharply downward to a point 6, and having the cutting-flange bent forward, forming a collar; said scraper provided near its under end with a circular slot 8, and bolt-holes; a winged stirrer 9, secured to the rear foot and inside of the outer end of said scraper, substantially as shown and described and for the purposes set forth.

4. In a right and left hand cultivator, to be used in combination with a double-footed-plow stalk 1, and wheeled cultivator; a scraper, its inner end extending downwardly forming a point 6, and turning forward forming a collar 5; said scraper provided near its inner end with bolt-holes and a circular slot 8; a right-angle-bar support 7, its two ends coming to a point, its flat side 7', fitting against the face of the forward foot 2, its two edges 7'', and 7''', fitting against the rear face of the scraper, and a stirrer 9, secured to the rear foot, and inside of the line of the free end of the scraper, substantially as shown and described and for the purposes set forth.

702,569. RAIL-JOINT. CHARLES R. JONES, St. Albans, W. Va. Filed Oct. 17, 1901. Serial No. 79,916. (No model.)

Claim.—The combination with two rails, the web portions thereof at the ends of said rails being thickened or enlarged, one end of one rail having projecting longitudinally therefrom near its base a Shank formed with an upwardly-projecting rectangular lug, and the abutting end of the other rail being provided with a longitudinal slot which terminates in a vertically-disposed socket, the walls of which are rectangular and closely fit said lug, substantially as set forth.

702,568. RAILWAY COUPLING APPARATUS. WILLIAM E. A. JONES, London, England. Filed Mar. 14, 1902. Serial No. 94,497. (No model.)

Claim.—1. In a link-coupler, the combination with the buffers, the draw-hook, and the coupling-chain; of means for supporting the outer link in a position to receive therein the draw-hook of an adjacent vehicle; means actuated by the movement of one or both of the buffers for raising said supporting means to cause said outer link to engage the hook of the adjacent car; and means actuated on the loosening of the coupling-chain for causing the supporting means to raise the outer link from engagement with the draw-hook of the adjacent vehicle.

2. In a link-coupler, the combination with the buffers, and the coupling-chain; of a draw-hook having a notch in its upper edge between its hook portion and the vehicle; of means for supporting the outer link in

a position to receive therein the draw-hook of an adjacent vehicle; means actuated on the loosening of the coupling-chain for causing the supporting means to raise the outer link from engagement with the draw-hook of the adjacent vehicle, and place the link in the said notch portion of the draw-hook.

3. In a link-coupler, the combination with the buffers, the draw-hook, and the coupling-chain; of a lifting-shaft arranged to be operated from either side of the vehicle; a link-carrier having the outer link of the coupling-chain connected therewith; a crank on said shaft connected with the link-carrier at an intermediate portion of the latter; a reversing-shaft; a lever on said latter shaft; and a connecting-rod attached to the free end of said latter lever, and connected to the lower extremity of the link-carrier.

4. In a link-coupler, the combination with the buffers, the draw-hook, and the coupling-chain; of a lifting-shaft arranged to be operated on either side of the vehicle; a link-carrier having one extremity connected with the outer link of the coupling-chain; a crank on said shaft connected with the link-carrier at an intermediate portion of the latter by a slotted joint; a reversing-shaft; a lever on said latter shaft; and a connecting-rod having one end connected with the lower end of the link-carrier, and having its other end loosely connected with the free end of said lever.

5. In a link-coupler, the combination with the buffers, the draw-hook, and the coupling-chain; of a lifting-shaft arranged to be operated from either side of the vehicle; a link-carrier having the outer link of the coupling-chain connected therewith; a crank on said shaft connected with the link-carrier at an intermediate portion of the latter; a reversing-shaft; a lever on said latter shaft; a connecting-rod attached to the free end of said latter lever, and connected to the lower extremity of the link-carrier; and a U-shaped support pivoted to the draw-hook below the inner link of the coupling-chain and arranged to rest on the said crank and support said inner link.

6. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of an upwardly-extending link-carrier having its upper end joined to the outer link of said chain near to the outer end thereof and adapted to move said coupling-link onto and from said draw-hook, a lifting-crank whereon said link-carrier is loosely mounted to turn, means for operating said lifting-crank from either side of said vehicle, and means connected to the lower end of said link-carrier and whereby said link-carrier can be turned about said lifting-crank as a center.

7. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of a slotted link-carrier joined at its upper end to the outer link of said chain near to the outer end thereof, and capable of moving said outer link onto and from said draw-hook, separate transverse lifting and reversing shafts mounted to turn on the end of said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being turned about a horizontal axis from said lifting-shaft and whereby said slotted link-carrier is mounted to turn, a reversing-lever capable of being turned about a hori-

zontal axis by movement of said reversing-shaft, and a connecting-rod joined to the lower end of said link-carrier and to said reversing-lever, and capable of moving said link-carrier to a limited extent relatively to said reversing-lever, and of being moved endwise by said lever, substantially as described for the purposes specified.

8. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of separate transverse lifting and reversing shafts mounted to turn on said vehicle and each capable of being operated from either side thereof, a lifting-crank fixed to said lifting-shaft, a reversing-lever mounted on said reversing-shaft and capable of being operated thereby, a slotted link-carrier loosely mounted on said lifting-crank and joined at its upper end to the outer link of said chain near to the outer end thereof and capable of moving said outer link onto and from said draw-hook and a connecting-rod joined to the lower end of said link-carrier and to said reversing-lever, capable of moving said link-carrier to a limited extent, and of being moved endwise by said lever.

9. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of separate transverse lifting and reversing shafts mounted to turn on said vehicle and capable of being turned from either side thereof, a lifting-crank capable of being lifted by said lifting-shaft, a reversing-shaft mounted to turn to a limited extent on said reversing-shaft and of being moved in a forward direction by said shaft, a stop arranged to limit backward movement of said reversing-lever, a slotted link-carrier loosely mounted on said lifting-crank joined at its upper end to the outer link of said chain, and capable of turning about a horizontal axis, and a connecting-rod joined to the lower end of said link-carrier and to said reversing-lever and capable of endwise movement to a limited extent on said lever.

10. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of separate lifting and reversing shafts mounted to turn on said vehicle, a lifting-crank fixed to said lifting-shaft, a reversing-lever on said reversing-shaft and capable of being operated thereby a stop to limit backward motion of said reversing-lever, an upwardly-extending link-carrier joined at its intermediate portion to said lifting-crank, and at its upper end to the outer link of said chain, and a connecting-rod between the lower end of said link-carrier and said reversing-lever.

11. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of transverse lifting and reversing shafts A and B, respectively mounted to turn on said vehicle, a lifting-crank C, fixed to said lifting-shaft A, a reversing-lever D, mounted to turn on said reversing-shaft B and which when turned in one direction being adapted to turn said reversing-lever in a forward direction and when turned in the opposite direction to move said reversing-lever in a backward direction, a link-carrier E, having its upper end joined to the outer link of said chain so as to compel the same from points near to the outer end thereof and provided with a slotted intermediate portion F, loosely mounted on said lifting-crank, and a connecting-rod G, joined to the lower end of said link-carrier and to said reversing-lever and capable of sliding endwise on said lever to an extent limited by stops H on said rod, substantially as described for the purposes specified.

12. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of separate transverse lifting and reversing shafts mounted to turn on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being operated from said lifting-shaft, a reversing-lever capable of being operated from said reversing-shaft, an upwardly-extending slotted link-carrier loosely mounted on said lifting-crank and joined at its upper end to the outer link of said coupling-chain, a connecting-rod connecting said reversing-lever to the lower end of said link-carrier, and a top cross-piece joined to the upper end of said link-carrier and arranged to extend over the outer end of said outer chain-link, substantially as described for the purposes specified.

13. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of separate transverse lifting and reversing shafts mounted to turn on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being operated from said lifting-shaft, a reversing-lever capable of being operated from said reversing-shaft, a cradle or holder for the outer link of said chain, an upwardly-extending slotted link-carrier loosely mounted on said lifting-crank and joined at its upper end to the outer end of said cradle or holder near to the outer end of said outer link, and a connecting-rod joined to the lower end of said link-carrier and to said reversing-lever, substantially as described.

14. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of transverse lifting and reversing shafts mounted to turn on said vehicle and capable of being operated from either side thereof, a lifting-

crank capable of being turned by said lifting-shaft, a reversing-lever capable of being turned by said reversing-shaft, an upwardly-extending slotted link-carrier loosely mounted at its intermediate portion to turn upon said lifting-crank, joined at its upper end to the outer link of said chain and capable of moving said link onto and from said draw-hook, a connecting-rod between the lower end of said link-carrier and said reversing-lever, and means adapted to support said lifting-shaft, crank, slotted lever and coupling-chain in position for automatic coupling.

15. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain joined to said draw-hook, of transverse lifting and reversing shafts mounted to turn on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being turned by said lifting-shaft, a reversing-lever capable of being turned by said reversing-shaft, an upwardly-extending slotted link-carrier loosely mounted at its intermediate portion to turn upon said lifting-crank, joined at its upper end to the outer link of said chain and capable of moving said link onto and from said draw-hook, a connecting-rod between the lower end of said link-carrier and said reversing-lever, means adapted to support said lifting-shaft and the parts carried thereby in position for automatic coupling, and means adapted to support said vehicle coming into contact with another vehicle to release said supporting-shaft and attached parts and permit automatic coupling to take place.

16. In railway coupling apparatus, the combination with a vehicle provided with endwise-movable buffers, with a draw-hook, and a coupling-chain joined to said draw-hook, of transverse lifting and reversing shafts mounted to turn on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being turned by said lifting-shaft, a reversing-lever capable of being turned by said reversing-shaft, an upwardly-extending slotted link-carrier loosely mounted at its upper end to the outer link of said chain and capable of moving said link onto and from said draw-hook, a connecting-rod between the lower end of said link-carrier and said reversing-lever, holding means adapted to support said lifting-shaft and the parts carried thereby in position for automatic coupling, and means controlled by said buffers and adapted to cause said holding means to release said lifting-shaft and attached parts by inward movement of either buffer and permit automatic coupling to take place.

17. In railway coupling apparatus, the combination with a vehicle provided with endwise-movable buffers, with a draw-hook, and a coupling-chain joined to said draw-hook, of operating apparatus capable of being operated from either side of the vehicle and to bring the outer coupling-link of said chain in position for automatic coupling, holding means adapted to support said operating apparatus and coupling-link in position for automatic coupling, and means controlled by the inner end of each buffer-rod and adapted on either of the buffer-rods being forced inward to cause said holding means to release said lifting-shaft and attached parts and permit automatic coupling to take place.

18. In railway coupling apparatus, the combination with a vehicle provided with endwise-movable buffers, with a draw-hook, and a coupling-chain joined to said draw-hook, of transverse lifting and reversing shafts mounted to turn on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being turned by said lifting-shaft, a reversing-lever capable of being turned by said reversing-shaft, an upwardly-extending slotted link-carrier loosely mounted at its intermediate portion to turn upon said lifting-crank, joined at its upper end to the outer link of said chain and capable of moving said link onto and from said draw-hook, a connecting-rod between the lower end of said link-carrier and said reversing-lever, holding means adapted to support said lifting-shaft and the parts carried thereby in position for automatic coupling, and means controlled by the inner end of each buffer-rod and adapted on either buffer-rod being forced inward to cause said holding means to release said lifting-shaft and attached parts and permit automatic coupling to take place.

19. In railway coupling apparatus, the combination with a vehicle provided with endwise-movable buffers, with a draw-hook, and a coupling-chain joined to said draw-hook, of transverse lifting and reversing shafts mounted to turn on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being turned by said lifting-shaft, a reversing-lever capable of being turned by said reversing-shaft, an upwardly-extending slotted link-carrier loosely mounted at its intermediate portion to turn upon said lifting-crank, joined at its upper end to the outer link of said chain and capable of moving said link onto and from said draw-hook, a connecting-rod between the lower end of said link-carrier and said reversing-lever, holding means adapted to support said lifting-shaft and the parts carried thereby in position for automatic coupling, and means adapted to move said holding means into a position to release said lifting-shaft arranged to be normally held out of action by said buffer-rods but to act when either buffer-rod is pushed inward.

20. In railway coupling apparatus, the combination with a vehicle provided with endwise-movable buffers, a draw-hook, and a coupling-chain joined to said hook, of transverse lifting and reversing shafts mounted on said vehicle and capable of being operated from either side thereof, a lifting-crank operated by said lifting-shaft, a reversing-lever operated by said reversing-shaft, a link-carrier mounted at an intermediate part of its length on said lifting-crank and connected at its upper end to the outer link of said chain, a connecting-rod between the lower end of said link-carrier and reversing-lever, a projection in connection with said lifting-shaft, two connected arms mounted on said vehicle and one of which is provided with a holding-teeth adapted to engage said projection and hold the lifting-crank in the raised position for automatic coupling after it has been moved into that position, and operating devices normally held in an inoperative position by the inner ends of the buffer-rods but each adapted when released by inward motion of either buffer-rod to automatically move and operate both arms and cause the holding-teeth to release said projection and lifting-shaft.

21. In railway coupling apparatus, the combination with a vehicle provided with endwise-movable buffers, a draw-hook, and a coupling-chain joined to said hook, of transverse lifting and reversing shafts mounted on said vehicle and capable of being operated from either side thereof, a lifting-crank operated by said lifting-shaft, a reversing-lever operated by said reversing-shaft, a link-carrier mounted at an intermediate part of its length on said lifting-crank and connected at its upper end to the outer link of said chain, a connecting-rod between the lower end of said link-carrier and reversing-lever, a projection in connection with said lifting-shaft, two connected arms mounted on said vehicle and one of which is provided with a holding-teeth adapted to engage said projection and hold the lifting-crank in the raised position for automatic coupling after it has been moved into that position, two rods each adapted when moved backward to engage one of said connected arms and move it and the other arm and the holding-teeth into a position to release the projection connected to said lifting-shaft, and spring devices each adapted, when released, to move one of said rods into its operative position but normally held out of action by the forward thrust of the corresponding buffer-rod.

22. In railway coupling apparatus, the combination with a vehicle provided with endwise-movable buffers, a draw-hook, and a coupling-chain joined to said hook, of transverse lifting and reversing shafts mounted on said vehicle and capable of being operated from either side thereof, a lifting-crank operated by said lifting-shaft, a reversing-lever operated by said reversing-shaft, a link-carrier mounted at an intermediate part of its length on said lifting-crank and connected at its upper end to the outer link of said chain, a connecting-rod between the lower end of said link-carrier and reversing-lever, a projection in connection with said lifting-shaft, a cross-shaft mounted on said vehicle, two arms fixed on said cross-shaft, one of which is provided with a holding-teeth, and both of which are normally pressed in a forward direction to bring said holding-teeth into a position to engage said projection and hold said lifting-crank in the raised position, connecting-rods adapted to engage said arms and move them backward, and spring-operated devices that are normally acted upon by the inner ends of the buffer-rods and hold said connecting-rods in their forward and inoperative positions but each of which will act to move back the corresponding connecting-rod and arm and withdraw said holding-teeth from said projection when the corresponding buffer-rod is forced inward.

23. In railway coupling apparatus, the combination with a vehicle provided with endwise-movable buffers, a draw-hook, and a coupling-chain joined to said hook, of transverse lifting and reversing shafts mounted on said vehicle and capable of being operated from either side thereof, a lifting-crank operated by said lifting-shaft, a reversing-lever operated by said reversing-shaft, a link-carrier mounted at an intermediate part of its length on said lifting-crank and connected at its upper end to the outer link of said chain, a connecting-rod between the lower end of said link-carrier and reversing-lever, a projection in connection with said lifting-shaft, a cross-shaft mounted on said vehicle and provided with forwardly-extending weighted arms, two upwardly-extending arms fixed to said cross-shaft and one of which is provided with a forwardly-extending holding-teeth adapted to engage with said projection and hold the lifting-crank in the raised position when the same is lifted into that position, two rods each adapted to engage the upper end of one of said arms each connected to one of said rods, each spring-actuated arm and rod being normally held in the forward and inoperative position by the inner end of the corresponding buffer-rod but adapted to automatically move backward and actuate said connected arms and withdraw said holding-teeth from said projection, when the corresponding buffer-rod is forced inward.

24. In railway coupling apparatus, the combination with a vehicle provided with a draw-hook, a coupling-chain joined thereto, and buffers having rods extending through the head-stock of the vehicle to the inner side thereof, of a transverse lifting-shaft mounted on said vehicle and provided at its central portion with a lifting-crank and at its ends with

lifting-handles one of which is provided with a lateral projection 21", a transverse reversing-shaft mounted on said vehicle and provided at its central portion with a reversing-lever and at its ends with weighted arms that normally extend in a forward direction, a slotted link-carrier mounted to turn on said lifting-crank and jointed at its upper end to the outer link of said chain, a connecting-rod between the lower end of said link-carrier and reversing-lever, upwardly-extending arms 24" fixed to said transverse shaft and one of which is provided with a holding-teeth 26" adapted to engage with said lateral projection, slotted connecting rods 29" engaging the upper ends of said arms 24", and spring-carriers 30, carried by said vehicle and each connected to one of said rods and arranged between the head-stock of the vehicle and an enlarged part of the inner end of the corresponding buffer-rod and normally compressed thereby, substantially as described for the purpose specified.

25. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon and a coupling-chain connected to said draw-hook, of transverse lifting and reversing shafts mounted on said vehicle and capable of being operated from either side thereof, a lifting-crank, capable of being operated by said lifting-shaft, a reversing-lever capable of being operated by said reversing-shaft, a stop to limit backward movement of said reversing-lever, a slotted link-carrier mounted to turn on said lifting-crank, jointed at its upper end to the outer link of said chain, and adapted to move said outer link from over said draw-hook to a position over the draw-hook of an adjacent vehicle and vice versa, a connecting-rod jointed to the lower end of said link-carrier and to said reversing-lever and capable of endwise motion, to a limited extent, relatively to said reversing-lever and of being operated by said reversing-lever, holding means adapted, when released, to hold said lifting-crank in the raised position into which it will be moved by said link-carrier when said chain is coupled to another vehicle and a pull is exerted thereon, and means whereby said reversing-shaft and lever can be caused to exert a thrust on said connecting-rod that will tend to move the lower end of said link-carrier outward and the upper end thereof inward, substantially as described for the purpose specified.

26. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain connected to said draw-hook, of transverse lifting and reversing shafts mounted on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being operated by said lifting-shaft, a reversing-lever capable of being operated by said reversing-shaft, a stop to limit backward movement of said reversing-lever, a slotted link-carrier mounted to turn on said lifting-crank, jointed at its upper end to the outer link of said chain, and adapted to move said outer link from over said draw-hook to a position over the draw-hook of an adjacent vehicle and vice versa, a connecting-rod jointed to the lower end of said link-carrier and to said reversing-lever and capable of endwise motion, to a limited extent, relatively to said reversing-lever and of being operated by said reversing-lever, holding means adapted, when released, to hold said lifting-crank in the raised position into which it will be moved by said link-carrier when said chain is coupled to another vehicle and a pull is exerted thereon, weighted arms fixed to said reversing-shaft and adapted when moved into a backward position to cause said reversing-lever to exert a forward thrust on said connecting-rod, and means carried by said reversing-shaft and adapted when said arms are turned into the backward position to release said holding means and allow the same to come into operation, and means for automatically disengaging said holding means from said lifting-crank when the coupling-chain falls back into its inoperative position.

27. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain connected to said draw-hook, of transverse lifting and reversing shafts mounted on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being operated by said lifting-shaft, a reversing-lever capable of being operated by said reversing-shaft, a stop to limit backward movement of said reversing-lever, a slotted link-carrier mounted to turn on said lifting-crank, jointed at its upper end to the outer link of said chain, and adapted to move said outer link from over said draw-hook to a position over the draw-hook of an adjacent vehicle and vice versa, a connecting-rod jointed to the lower end of said link-carrier and to said reversing-lever and capable of endwise motion, to a limited extent, relatively to said reversing-lever and of being operated by said reversing-lever, holding means adapted when said reversing-lever is turned into a forward position to hold said lifting-crank in the raised position into which it will be moved by said link-carrier when said chain is coupled to another vehicle and a pull is exerted thereon, a weighted arm fixed to said reversing-shaft and adapted when moved into a backward position to cause said reversing-lever to exert a forward thrust on said connecting-rod, and a cam carried by said reversing-shaft and adapted when said reversing-lever is moved forward, by said connecting-rod, under the action of said link-carrier and chain, to disengage said holding means from said lifting-crank, substantially as described for the purpose specified.

28. In railway coupling apparatus, the combination with a vehicle, a draw-hook thereon, and a coupling-chain connected to said draw-hook, of transverse lifting and reversing shafts mounted on said vehicle and capable of being operated from either side thereof, a lifting-crank capable of being operated by said lifting-shaft, a reversing-lever capable of being operated by said reversing-shaft, a stop to limit backward movement of said reversing-lever, a slotted link-carrier mounted to turn on said lifting-crank, jointed at its upper end to the outer link of said chain, and adapted to move said outer link from over said draw-hook to a position over the draw-hook of an adjacent vehicle and vice versa, a connecting-rod jointed to the lower end of said link-carrier and to said reversing-lever and capable of endwise motion, to a limited extent, relatively to said reversing-lever, and of being operated by said reversing-lever, a weighted arm fixed to said reversing-shaft and adapted when moved into a backward position to cause said reversing-lever to exert a forward thrust on said connecting-rod and the lower end of said link-carrier, a toothed segment connected to said lifting-shaft, a pawl pivoted to said vehicle and adapted, when said weighted arm is turned into its backward position, to engage said toothed segment and hold the lifting-crank in the raised position into which it will be moved by said link-carrier when said chain is coupled to another vehicle and a pull is exerted thereon, and a cam-like projection carried by said reversing-shaft and adapted, when said reversing-lever is moved forward to a further extent by a pull of said connecting-rod, caused by automatic turning movement of said link-carrier, to force said pawl out of engagement with said segment, substantially as described for the purpose specified.

702,564. CAR-TRUCK. HENRY R. KENTLEY, Buffalo, N. Y.
Filed Jan. 20, 1902. Serial No. 90,472. (No model.)

Claim.—1. In a trucked side frame for railway-car trucks the combination of two pedestals, a tension member formed with a vertical web and oppositely-projecting lateral flanges, a compression member formed with a vertical web and oppositely-projecting lateral flanges, the end portions of the webs of said tension and compression members being arranged vertically and secured to said pedestals, and the end portions of the lateral flanges of one of said members being arranged directly above the end portions of the lateral flanges of the other member, substantially as set forth.

2. In a trucked side frame for railway-car trucks, the combination of pedestals each having a vertical web and a laterally-projecting flange, a tension member formed with a vertical web and a horizontal flange, and a compression member formed with a vertical web and a horizontal flange, the end portions of the webs of said tension and compression members being arranged vertically side by side and riveted to each other and to the vertical webs of said pedestals, and the end portions of the horizontal flanges of one of said members being arranged directly above the end portions of the horizontal flanges of the other member, substantially as set forth.

3. In a trucked side frame for railway-car trucks, the combination of two pedestals each having a vertical and a lateral flange, a tension member formed with a vertical web and oppositely-projecting upper and lower flanges, a compression member formed with a vertical web and a horizontal flange, the end portions of the webs of the tension and compression members being arranged side by side and parallel with the vertical webs

of the pedestals, and the end portions of the flanges of said tension and compression members being superposed, and connecting-rivets or the like passing through the vertical webs of said tension and compression members and the vertical webs of said pedestals, substantially as set forth.

4. In a trucked side frame for railway-car trucks, the combination of two pedestals each having a vertical web and a lateral flange, a tension member formed with a vertical web and oppositely-projecting upper and lower flanges, a compression member formed with a vertical web and a horizontal flange, the end portions of the webs of the tension and compression members being arranged side by side and parallel with the vertical webs of the pedestals, and the end portions of the upper flanges of said tension and compression members being superposed and extending over the vertical webs of the pedestals and connecting-rivets or the like passing through the vertical webs of said tension and compression members and the vertical flanges of said pedestals, substantially as set forth.

5. In a trucked side frame for railway-car trucks, the combination of two pedestals each having a vertical web and a lateral flange, a tension member formed with a vertical web and oppositely-projecting upper and lower flanges, a compression member formed with a vertical web and oppositely-projecting upper and lower flanges, the end portions of the webs of the tension and compression members being arranged side by side and parallel with the vertical webs of the pedestals and the end portions of the upper flanges of said tension and compression members being superposed and extending over the vertical webs of the pedestals and end portions of the lower flanges of said tension and compression members being superposed and being arranged over the lateral flanges of the pedestals, and connecting-rivets or the like passing through the vertical webs of said tension and compression members and the vertical flanges of said pedestals, substantially as set forth.

6. In a railway-car truck, the combination of two side frames, each composed of two pedestals having vertical webs, a tension member formed with a vertical web and a horizontal flange, a compression member formed with a vertical web and a horizontal flange, the end portions of the webs of said tension and compression members being arranged side by side and parallel with the vertical webs of the pedestals and the end portions of the horizontal flanges of said members being superposed and extending over the vertical webs of the pedestals, rivets or the like connecting the webs of said tension and compression members to the vertical webs of said pedestals, a transverse having vertical end flanges, the lower portions of which are secured to the vertical webs of the tension members, and the upper portions of which are secured to the vertical webs of said compression members, substantially as set forth.

7. In a railway-car truck, the combination of two side frames, each composed of pedestals having vertical webs and laterally-projecting flanges, a tension member formed with a vertical web and a horizontal flange, a compression member formed with a vertical web and a horizontal flange, the end portions of the webs of said tension and compression members being arranged side by side and parallel with the vertical webs of the pedestals, and the end portions of their horizontal flanges being superposed and extending over the vertical webs of said pedestals, rivets or the like connecting the end portions of the webs of the tension and compression members together and to said pedestals, a transverse arranged between said side frames and composed of two Z members each having vertical end flanges, rivets or the like securing the lower portions of the end flanges of the transverse members to said tension members, a plate arranged between the upper portions of the end flanges of said transverse members and the vertical webs of the compression members, and rivets or the like connecting said plates to said compression members and to the end flanges of said transverse members, substantially as set forth.

8. The combination of two side frames each composed of pedestals, a tension member formed with a vertical web and oppositely-projecting lateral flanges, a compression member formed with a vertical web and oppositely-projecting lateral flanges, the end portions of the webs of said tension and compression members being arranged vertically and secured to the pedestals, and the end portions of their flanges being superposed, a transverse engaging said side frames, a bolster, and springs arranged between the end portions of the transverse and the bolster, substantially as set forth.

702,565. RAILWAY-CAR TRUCK. HENRY R. KENTLEY, Buffalo, N. Y. Filed Apr. 11, 1902. Serial No. 100,657. (No model.)

Claim.—1. In a trucked side frame for railway-car trucks, the combination of two pedestals, a tension member formed with a vertical web and a horizontal flange, and a compression member formed with a vertical web and a horizontal flange, the end portions of the webs of said tension and compression members being arranged side by side and parallel with the vertical webs

2. In a trussed side frame for railway-car trucks, the combination of pedestals each having a vertical web and a laterally-projecting flange, a tension-chord formed with a vertical web and a horizontal flange the end portions of the web being connected to the webs of said pedestals, and a compression-chord formed with a vertical web and a horizontal flange, the end portions of the web of said compression-chord being arranged in substantially the same vertical plane and above the end portions of the web of the tension-chord, and the end portions of the horizontal flange of the compression-chord resting on and riveted to the end portions of the flange of the tension-chord, substantially as set forth.

3. In a trussed side frame for railway-car trucks, the combination of two pedestals, a tension-chord connected to said pedestals and formed with a vertical web and a horizontal flange, a compression-chord formed with a vertical web and a horizontal flange, the end portions of the webs of said tension and compression chords being arranged in substantially the same plane, and the end portions of the horizontal flange of one member being arranged directly above and riveted to the end portions of the horizontal flange of the other chord, and vertical plates arranged beside and secured to the end portions of the webs of said chords, substantially as set forth.

4. In a trussed side frame for railway-car trucks, the combination of pedestals each having a vertical web and a laterally-projecting flange, a tension-chord formed with a vertical web and a horizontal flange the end portions of the web being connected to the webs of said pedestals, a compression-chord formed with a vertical web and a horizontal flange, the end portions of the web of said compression-chord being arranged in substantially the same vertical plane and above the end portions of the web of the tension-chord, and the end portions of the horizontal flange of the compression-chord resting on and riveted to the end portions of the flange of the tension-chord, and vertical plates arranged beside and secured to the end portions of the webs of said chords, substantially as set forth.

5. In a trussed side frame for railway-car trucks, the combination of two pedestals, a tension-chord in the form of a Z-bar connected to said pedestals and arranged with its web vertical, a compression-chord in the form of a Z-bar arranged with its web vertical, the end portions of the web of the compression-chord being arranged in substantially the same vertical plane and above the end portions of the web of the tension-chord, and the end portions of the lower horizontal flange of the compression-chord resting upon the end portions of the upper horizontal flange of the tension-chord, and vertical plates arranged beside and secured to the end portions of the webs of said chords between the separated flange thereof, substantially as set forth.

6. The combination of two side frames, the chords of each of which are formed with a vertical web and a horizontal flange, a transom composed of channel-beams the ends of which project between the chords of said side frames, and bars each having a vertical web secured to the webs of the chords of the adjacent side frame and a flange secured to the adjacent end of the transom, substantially as set forth.

7. The combination of two trussed side frames, the chords of each of which are formed with a vertical web, and a horizontal flange, a transom composed of channel-beams the ends of which project between the chords of said side frames, and bars each having a vertical web secured to the webs of the chords of the adjacent side frame and a flange secured to the adjacent end of the transom, substantially as set forth.

to the webs of the chords of the adjacent side frame and a flange secured to the adjacent end of the transom, substantially as set forth.

8. The combination of two trussed side frames, the chords of each of which are formed with a vertical web and a horizontal flange, a transom composed of channel-beams the ends of which project between the chords of said side frames, plates connected to the upper and lower flanges of the transom-channels and to the chords of the side frames, and bars each having a vertical web secured to the webs of the chords of the adjacent side frame and a flange secured to the adjacent end of the transom, substantially as set forth.

702,566. PROCESS OF RESERVE AND DISCHARGE OF TEXTILE FABRICS. EDWARD KESNER, Manchester, England. Filed Mar. 18, 1902. Serial No. 95,257. (No specimens.)

Claim.—The process of preventing the production and effecting the discharge of color in textile fabrics, which consists in treating the goods with a titanium salt contained in a solvent medium, substantially as set forth.

702,567. COMBINED FOLDING COT AND TENT. DAVID I. KERN, Verona, Pa.; John L. Kahn administrator of said David I. Kern, deceased. Filed June 8, 1902. Serial No. 19,153. (No model.)

Claim.—1. In a combined tent and cot, the combination with the cot-frame, of bails pivotally secured thereto and adapted to overlap each other; means for securing said bails in folded position, and braces for supporting the tent-cover above said bails.

2. In a combined tent and cot, the combination with the side bars of the frame, formed with recesses on their inner sides; of legs pivotally secured to said side bars, and connected in pairs by crossed braces, the upper ends of which project beyond the legs to support the side bars; and catches for securing the free ends of the legs.

3. In a combined tent and cover, the combination with the cot-frame, of a tent-frame comprising overlapping pivoted bails; a bail secured to the ridge of the tent-cover, and adapted to rest upon said pivoted bails; cross-braces also secured to the tent-cover and adapted to rest upon the pivoted bails; and means for securing the bails in their overlapping or folded position.

4. In a combined tent and cot, the combination with the cot-frame, of a tent-cover the ends of which are secured to the ends of said cot-frame; folding frames or bails pivotally secured to the cot-frame and adapted to overlap each other when folded; a ridge-support comprising a bail having forked ends to engage the folding bails; and cross-rods secured to fit upon said pivoted bails; and devices for securing the pivoted bails in folded position.

702,568. COMPOSING MECHANISM FOR TYPE-MACHINES. TOLBERT LANTIER, Washington, D. C., assignor to Lanston Monotype Machine Company, Washington, D. C., a Corporation of Virginia. Filed Mar. 9, 1901. Serial No. 30,107. (No model.)

Claim.—1. In a composing-machine the combination with a record-strip-composing mechanism or keyboard provided with character and justification punches, of independent feeds for said two varieties of punches; two sets of keys controlling the character and justification punches and feeds respectively; and a lock-out controlled by the character-keys and operating to arrest the movement of the justification-feed after the formation of a predetermined series of character-perforations; substantially as described.

2. In a composing-machine such as described, the combination with a record-strip-composing mechanism or keyboard provided with character and justification punches, of independent feeds for each set of punches with actuating mechanism therefor; a lock-out for suspending the action of one of said feeds; and a take-up for effecting the withdrawal of slack between the feeds after the completion of each line, to restore initial conditions preparatory to the formation and delivery of the next succeeding line.

3. In a composing mechanism or keyboard for type-setting machines such as described, the combination of the following elements, to wit: a series of character-punches; a feed pertaining to said punches; a series of justification-punches removed from said character-punches; a feed per-

taining to said justification-punches; and a take-up acting through the justification-feed to advance the strip after the justification perforations have been produced.

4. In a record-strip-composing mechanism or keyboard such as described, the combination of the following elements, to wit: a series of character-punches; a character-feed; a series of justification-punches; a justification-feed; a variable actuating mechanism for effecting simultaneous and separate movements of the said two feeds; and a lock-out for the justification-feed for suspending its action after a predetermined number of feed movements.

5. In a record-strip-composing mechanism or keyboard the combination of the following elements, to wit: a series of character-punches; an independent series of justification-punches; individual feeds for each of said series of punches; a lock-out for the justification-feed; and a take-up mechanism operating through the justification-feed to take up or draw off the accumulation of strip between the two feeds due to the suspension of the justification-feed.

6. In a record-strip-composing machine the combination of the following elements, to wit: a series of character-punches provided with a paper-feed; a series of justification-punches provided with an independent feed; actuating mechanism for the said independent feeds; and a lock-out for the justification-feed connected to the actuating device of the character-feed to suspend the action of the justification-feed after a predetermined number of feed movements of the character-feed.

7. In a record-strip-composing machine the combination of the following elements, to wit: a character-feed; a justification-feed; a lock-out for the justification-feed; a take-up mechanism operating through the justification-feed; independent actuating mechanism for each of said feeds and an intermittent feed for the lock-out and take-up.

8. In a record-strip-composing machine containing character and justification punches, independent feeds therefor, and a lock-out for the justification-feed, and in combination therewith, an actuating or setting mechanism for the lock-out including a spring-actuated lock-bar, a rack-bar engaged by said lock-bar to restrain its motion, and an intermitting feed mechanism driven from the character-feed-actuating device for advancing the said rack-bar each time the character-feed is actuated, to arrest the justification-feed at any predetermined number of movements of the character-feed.

9. In a record-strip-composing machine or keyboard such as described, the combination with character and justification punches, independent feeds therefor, and a lock-out for the justification-feed, of a take-up provided with an intermitting actuating or setting mechanism for measuring the feed movements of the character-feed; substantially as described.

10. In a record-strip-composing mechanism or keyboard the combi-

nation with the character and justification feeds, a lock-out for the justification-feed, and a take-up, of actuating or measuring devices controlling the application of the lock-out and the extent of effective movement of the take-up; substantially as described.

11. In a record-strip-composing mechanism or keyboard, the combination with the character and justification feeds, a lock-out for the justification-feed and a take-up, of an actuating or measuring mechanism connected to the character-feed or the actuating device therefor and controlling the engagement of the lock-out and the extent of the take-up action; substantially as described.

12. In a record-strip-composing machine or keyboard containing character and justification punches, an independent feed for each set of punches, and a lock-out for the justification-feed, and in combination therewith, a take-up and an actuating mechanism therefor the latter including the following elements, to wit: a movable member—such as the rack-bar; a ratchet mechanism engaging said movable member to shift it one degree each time the character-feed is actuated, thereby measuring the feed movements; a connection intermediate said movable member and the justification-feed, permitting limited independent movement; trip devices for releasing said movable member; and a motor for returning the movable member to initial position, and in so doing advancing the justification-feed; substantially as described.

13. In a record-strip-composing machine or keyboard the combination with independent feeds for the strip, a lock-out for one of said feeds, a take-up and an actuating or setting mechanism for measuring the degree of take-up motion.

14. In a record-strip-composing machine or keyboard, the combination with two sets or series of punches arranged in sequence and an independent feed for each set of punches, of a lock-out and a take-up connected to one of said feeds and a feed device or controller for measuring the time of application of the lock-out and the extent of movement of the take-up; substantially as described.

15. In a record-strip-composing machine or keyboard the combination of the following elements, to wit: a series of key-controlled character-punches and a feed mechanism; a series of key-controlled justification-punches and a feed mechanism; an indicating mechanism responding to the keys of the character-punches and designating the keys of the justification-punches; a lock-out for the justification-feed act or adjusted by the action of the character-keys; and a take-up whose measured movements are governed by both character and justification keys; substantially as described.

16. In a record-strip-composing machine or keyboard the combination of the following elements, to wit: a series of key-controlled character-punches and associated feed mechanism; a series of key-controlled justification-punches and associated feed mechanism; an indicating mechanism responding to the character-keys and designating the justification-keys; a lock-out for the justification-feed act or adjusted from the character-keys; and a take-up act or adjusted from both character and justification keys and operating to advance the justification-feed a distance equal to the total character-feed movements minus a predetermined number of such movements.

17. In a record-strip-composing machine or keyboard the combination of the following elements, to wit: key-controlled character-punches and a feed; key-controlled justification-punches and a feed; an indicating mechanism responsive to the character-keys; a ratchet-key and connections for the indicating mechanism; a lock-out for the justification-feed controlled from the character-keys; a take-up adjusted from both character and justification keys; and a release mechanism for the take-up and lock-out controlled by the ratchet-key; substantially as described.

18. In a record-strip-composing machine or keyboard the combination of the following elements, to wit: key-controlled character-punches and a feed; key-controlled justification-punches and a feed; an indicating mechanism responsive to the character-keys; a ratchet-key for the indicating mechanism; a lock-out for the justification-feed; and a take-up provided with a motor controlled from the ratchet-key.

19. In a record-strip-composing machine or keyboard the combination of the following elements, to wit: two independent feeds—character and justification—each provided with an actuating mechanism; two series of keys—character and justification—each controlling both of said feed-actuating mechanisms; and a lock-out act or adjusted by the actuating mechanism of one feed and acting upon the other to suspend its action; substantially as described.

20. In a record-strip-composing machine or keyboard the combination of the following elements, to wit: two independent feeds—character and justification—each provided with an actuating mechanism; a lock-out act or adjusted by the actuating mechanism of one feed and acting upon the other to suspend its action after a predetermined number of feed motions and a take-up also act or adjusted by the actuating mechanism of one feed and acting upon the other feed to take up the slack between the two feeds caused by the interruption of one of said feeds; substantially as described.

21. In a record-strip-composing machine or keyboard the combination with the character and justification punches and their independent feeds, of a lock-out for the justification-feed comprising the following elements, to wit: a rack-bar; an intermittent driving mechanism connected to the actuating device of the character-feed and engaging said rack-bar, to advance the latter at each movement of the character-feed; and a lock-bar engaged by the rack-bar and movable therewith into engagement with the justification-feed.

22. In a record-strip-composing machine or keyboard the combination with the character and justification feeds, of a lock-out and take-up for the justification-feed comprising the following elements, to wit: a rack-bar movable in guides; an actuating mechanism connected thereto and driven from the actuating device of the character-feed; a lock-bar controlled by said rack-bar in its movements toward the justification-feed to lock the latter; and a slotted pawl-carrier engaging the justification-feed and engaged by a pin moving in unison with said rack-bar; substantially as described.

23. In a record-strip-composing machine or keyboard such as described provided with independent character and justification feeds, a lock-out for the justification-feed and justification-punches, of connections intermediate said punches and the lock-out for withdrawing the latter when a justification-punch is operated; substantially as described.

24. In a record-strip-composing machine or keyboard such as described, the combination with the lock-out for the justification-feed, of the bell-crank controlled by the justification-keys and engaging the lock-out to withdraw the latter, and a lock for retaining said bell-crank in retracted position, as and for the purpose specified.

25. The combination with the justification-punches, the feed therefor, and the lock-out, of a release mechanism responding to the movement of any justification-punch and acting upon the lock-out to withdraw the latter and permit movement of the justification-feed; substantially as described.

26. The combination with the justification-punches, the feed therefor, the lock-out, and key-controlled actuating mechanism for said punches, and feed, of a lock-out retractor responding to the movement of the punch-actuating mechanism, a lock for said retractor, and a key-controlled release for said lock.

27. In a record-strip-composing machine or keyboard such as described provided with independent character and justification punches and separate feeds therefor, the combination therewith of separate motors for the two feeds and a single controller or valve responding to the action of both sets of punches; substantially as described.

28. The combination with the character and justification punches, their individual feeds, and actuating device, of a single control-valve for the two feed-motors, and means for actuating said control-valve from either set of punches; substantially as described.

29. In a record-strip-composing machine or keyboard the combination with the character-punches, of a feed provided with radial punches and a rotary die with which said radial punches engage to form the feeding-perforations for the strip; substantially as described.

30. In a record-strip-composing machine or keyboard the combination with the character-punches, of a feed provided with a rotating member located at each end of the series of punches and furnished with radial punches, a series of dies mounted upon a rotating support opposite each series of radial punches and engaged thereby, and a tension device engaging the strip; substantially as described.

31. The combination with the justification-feed, the lock-out therefor, the take-up mechanism, and the ratchet-actuating device for said feed and take-up, of the tripping or releasing mechanism comprising a retractor engaging the lock-out, a trip for the take-up ratchet mechanism, and a trip for the feed-actuating mechanism, said lock-out retractor being actuated by the justification-punches and said trips by a motor controlled from a key; substantially as described.

32. The combination with the shaft controlling the tripping device of the justification-feed-actuating mechanism and the lock-out-actuating mechanism and the retractor or bell-crank for releasing the lock-out, of the latch engaging said retractor and the arm carried by said shaft for engaging said latch when said tripping device are operated; substantially as described.

33. The combination with a feed-shaft, such as that of the justification-feed, provided with a toothed wheel and a ratchet-wheel fast thereon, of a slotted pawl-carrier or disk whose pawl engages said ratchet-wheel, a ratchet mechanism and a gear-wheel driven thereby, the latter carrying a pin riding in the slot of the pawl-carrier; a lock-bar for engaging the toothed wheel fast on the feed-shaft; and a rack-bar driven by the gear of the ratchet mechanism and engaged by the lock-bar to limit the approach of the latter to its wheel, substantially as and for the purpose specified.

34. The combination with the ratchet-driving mechanism of the justification-feed, of the sectional locking-pawl and a trip device contacting

with one section thereof, to withdraw the engaging section and release the feed so that it can advance under the influence of the take-up mechanism; substantially as described.

35. In a record-strip-composing machine or keyboard such as described, the combination of the following elements, to wit: a series of character-punches, actuating devices, and a feed; a series of justification-punches, with actuating devices and a feed; an indicating mechanism and actuating device therefor; a series of keys controlling the actuating devices of the indicating mechanism and of the character-punches; a series of keys controlling the actuating devices of the justification-punches; a key controlling the resetting of the indicating mechanism; a lock-out and take-up for the justification-feed; and a motor for the take-up controlled by said resetting-key.

36. In a take-up for record-strip-composing machines or keyboards such as described, the combination with the slotted pawl-carrier or disk, the feed mechanism, the propelling rack-bar, and the pin engaging the rack-bar and provided with a pin for engaging opposite walls of the slot in the pawl-carrier, of a detainer, such as the spring-pawl, engaging the pawl-carrier for detaining the latter while the pin is traversing the interval between the engaging surfaces; substantially as described.

37. In a record-strip-composing machine or keyboard such as described, and in combination with the chart-carrying device provided with main and supplemental motors, of a lock engaging the supplemental-motor-actuating device, and means for unlocking the same at a predetermined point in the traverse of the main motor; substantially as described.

38. In a record-strip-composing machine or keyboard such as described, and in combination with the chart-carrying device and the main and supplemental motors acting thereon, of a lock for retaining the chart in position preliminary to the engagement of the main motor, the same including a locking-pin and a motor therefor the latter controlled by the piston of the main motor; substantially as described.

39. In a record-strip-composing machine or keyboard, such as described, and in combination with the chart-carrying mechanism of the indicating device, and the main motor, of a lock for the chart-carrying mechanism when disconnected, temporarily, from the main-motor device, the same comprising a bolt arranged to project into the path of a portion of the chart-carrying mechanism; a piston working in a cylinder and connected to said bolt; and a supply duct or passage communicating with said cylinder and with the cylinder of the main motor for effecting the withdrawal of the lock when the piston of the main motor passes a predetermined point and the driving device connected therewith is about to engage the chart-carrying mechanism, as and for the purpose described.

40. In a composing-machine and as a means for controlling the traverse of a strip or ribbon with relation to two fixed points in the line of its motion, the combination of two independent feeds arranged for simultaneous and discontinuous action, a cut-off for automatically arresting one of said feeds, and an automatic take-up act or adjusted to advance the arrested feed as many units as the one feed is operated in excess of the other; substantially as described.

702,569. FLOOR-RUBBER. CHARLES F. LEMER, NEWARK, N.J., assignor of one-half to Joseph H. HANCOCK, NEWARK, N.J. Filed Mar. 4, 1902. Serial No. 94,664. (No model.)

Claim.—1. A floor-rubber comprising a block having a handle, a pad on the under side of the block, a pad-facing cloth drawn on the block over the upper edge of same, and cloth-binding spring-clips each consisting of a single bent plate of spring metal made fast at one end on the top of said block and having its other or free bent end pointed in opposition to the same.

2. A floor-rubber comprising a slotted block having a handle, a slotted pad on the under side of the block, the pad and block slots being in register; a removable pad-facing cloth drawn on said block over the upper edge of same, means by which the cloth is detachably held in place, a reservoir suspended over the slotted block, and means for regulating feed of fluid contents of the reservoir to said cloth through the block and pad slots.

3. A floor-rubber comprising a slotted block having a handle, a slotted pad on the under side of the block, the pad and block slots being in register; a gutter engaging said slots and provided with a rear shield extension, standards on the block, a reservoir in transverse connection with the standards and having preponderance of weight below its transverse, a pull-cord arranged in connection with the reservoir to turn the same toward the rear and bring a normally upper outlet thereof over the gutter, a pad-facing cloth, and means in connection with said block for holding the cloth in place.

4. A floor-rubber comprising a slotted block having a handle, a slotted pad on the under side of the block, the pad and block slots being in register; a gutter engaging said slots and provided with a rear shield extension, standards on the block, a reservoir in transverse connection with the standards and having preponderance of weight below its transverse, a pull-cord in connection with the reservoir to turn the same toward the rear and bring a normally upper outlet thereof over the gutter, a standard opposing stop-lag extending from said reservoir to limit rotary adjustment of same by the cord, a pad-facing cloth, and means in connection with said block for holding the cloth in place.

702,570. CORNED APPLICATOR AND STRAINER. LEONARD J. LOHMEYER, Lusk, Wyo. Filed Aug. 1, 1901. Serial No. 70,493. (No model.)

Claim.—The combination with the cylinder, provided with the shoulder and threaded upper end, of the hopper having the shouldered and interior threaded lower end; the shield, interposed between the shoulder of the cylinder and the lower end of the hopper; the plug-rod having the stop at and colored female screw-threaded lower end, the whole adapted to operate substantially as described.

702,571. PROCESS OF MANUFACTURING STARCH. JENKINS LEONARD, Paris, France, assignor to Societe des Produits Amylaceux, Paris, France. Filed Feb. 28, 1902. Serial No. 94,706. (No specimens.)

Claim.—1. An improvement in the manufacture of starch which consists in subjecting the material from which the starch is derived to a suitable acid solution, washing and grinding the mass, purifying the ground mass, then diluting the purified mass, electrolyzing the diluted mass, removing the organic precipitate from the product, purifying the product, diluting the product, and then suitably drying the diluted product, substantially as set forth and for the purpose specified.

2. An improvement in the manufacture of starch which consists in subjecting the material from which the starch is derived to a sulfurous-acid solution, washing and grinding the mass, purifying the ground mass, then diluting the purified mass, electrolyzing the diluted mass, removing the organic precipitate from the product, purifying the product, diluting the product, and then suitably drying the diluted product, substantially as set forth and for the purpose specified.

the organic precipitate from the product, purifying the product, diluting the product, and then suitably drying the diluted product, substantially as set forth and for the purpose specified.

3. An improvement in the manufacture of starch which consists in subjecting the material from which the starch is derived to a sulfurous-acid solution, washing and then grinding the mass while in contact with a jet of pure water, purifying the ground mass, diluting the purified mass, electrolyzing the diluted mass, removing the organic precipitate from the product, purifying the product, diluting the product, and then suitably drying the diluted product, substantially as set forth and for the purpose specified.

4. An improvement in the manufacture of starch consisting in subjecting the material from which the starch is derived to a suitable acid solution, washing and grinding the mass, purifying the ground mass on inclined planes, diluting the purified mass, electrolyzing the diluted mass, removing the organic precipitate from the product, purifying the product on inclined planes, diluting the product, and then suitably drying the diluted product, substantially as set forth and for the purpose specified.

5. An improvement in the manufacture of starch consisting in subjecting the material from which the starch is derived to a suitable acid solution, washing and grinding the mass, purifying the ground mass on inclined planes, diluting the purified mass, electrolyzing the diluted mass, removing the organic precipitate from the product, purifying the product on inclined planes, diluting the product to the consistency of cream, and then suitably drying the diluted product, substantially as set forth and for the purpose specified.

702,572. GRAIN-EJECTOR FOR CORN-PLANTERS. ANDREW J. MARSHALL, THUNDER, Tenn. Filed Aug. 24, 1901. Serial No. 73,167. (No model.)

Claim.—1. In a corn-planter, the combination with a reciprocating seed-slide, of a rotary vertically-yieldable ejector, and a cut-off adapted for vertical yielding and rocking motion independently of the ejector.

2. A grain-ejector for corn-planters comprising a casing provided with oppositely-disposed shoulders having elongated orifices, an ejector having projections working in the orifices, and a spring-pressed cut-off straddling the shoulders and having rounded faces coating therewith.

3. A grain-ejector for corn-planters comprising a casing provided with oppositely-disposed shoulders having elongated openings therein, a seed-slide movable in the casing, a rotary ejector having projections working in the said orifices, a cut-off straddling the shoulders and having rounded shoulders coating therewith, and springs associated with the casing and bearing upon the cut-off.

4. A grain-ejector for corn-planters, comprising a casing provided with oppositely-disposed shoulders having elongated orifices, an ejector having projections working in the orifices, a spring-pressed cut-off straddling the shoulders and having rounded faces coating therewith, and a cover provided with means to interlock with the casing.

5. A grain-ejector for corn-planters, comprising a bottom plate, a seed-slide guided for movement thereby, and a casing including an ejector and a cut-off, said casing comprising two members each of which is provided with a base-flange for attachment to the bottom plate, with a side wall extending at right angles to the base-flange, and with an end wall undercut to permit movement of the seed-slide, each side wall being provided with an angular groove and each end wall being provided with a beveled edge and with a top flange projecting beyond the edge, the angular grooves, when the members are assembled, being engaged by the beveled edges of the end walls, and the ends of the side walls being engaged by the projected portions of the flanges, a cover having internal flanges to interlock with those of the end walls, and locking means carried by the cover.

702,573. APPARATUS FOR THE MANUFACTURE OF ARTIFICIAL STONE. FRIEDRICH MARK, Leipzig, Germany. Filed May 17, 1901. Serial No. 94,708. (No model.)

Claim.—In an improved apparatus for the manufacture of artificial stone free of pores, from a mixture of burnt magnesia, calcium carbonate and a hy of magnesium chloride as maintaining means, from which later the impurities have been removed by sublimating in atmospheric air, whereby the said impurities settle down and, in consequence of the extraction of the salts, a consistent and unvariable product is obtained, especially suitable for lithographic stones, the combination of a horizontally-rotatable drum, mounted rotatably, containing mixing-balls and pro-

vided with maintaining means *f* and *g*, an opening *e* in the drum, a funnel *h* thereabove for the charge of the drum, a hermetically-shuttable mold-casing *A* containing a mold-box *l* and a connecting-piece between the mixing-drum *a* and the casing *A*, this connecting-piece being provided with a telescopically-extending pipe *k*, adapted to slide into the union *d* of the mixing-drum in such manner that the said drum *a* and the casing *A* become hermetically connected, whereby after exhaustion of the air, for instance by means of an injector or the like, no more air can again enter through the connecting-piece *k* and the production of the stone is effected in vacuo, essentially as and for the purpose set forth.

702,574. STEP-LADDER. ALBERT MAR, Chicago, and CHARLES FARRER, Clyde, Ill., assignors to Peter Bunt. Filed Nov. 2, 1901. Serial No. 60,574. (No model.)

Claim.—1. In a step-ladder the combination of steps, side rails to which the steps are secured, each side rail extending above the upper step of the step-ladder, combined angle-pieces and straps formed of sheet metal and attached to the side rails and to the steps, folding legs on the outside of the side rails, a rod extending underneath the top step of the ladder through the folding legs, through the side rails and through the parts of the combined angle-pieces and straps which are attached to the side rails, with means for securing the rod in place, whereby each rod constitutes the pivot of the folding legs and a tie binding the top step, the side rails and the folding legs together, and the parts of the combined angle-pieces and strap which are attached to the side rails form sheet-metal plates to prevent splitting of the side rails by each rod; substantially as described.

2. In a step-ladder, side rails and steps, in combination with a combined angle-piece and straps, each angle-piece and straps formed from a sheet-metal blank to obtain a vertical part contacting with the side rails, a table on which the steps may rest, and extensions of each table, each end extension respectively bent into plane substantially at right angles to the table, and straps extending from the side of the end extensions which are adjacent to the vertical part, and each strap extending partially around the side rails; substantially as described.

3. A combined angle-piece and straps consisting of a blank of sheet

metal formed to obtain a vertical part, a table on which the steps may rest, and extensions of each table, each end extension respectively bent into plane substantially at right angles to the table, and straps extending from the side of the end extensions which are adjacent to the vertical part, with perforations provided in each combined angle-piece and straps whereby the same may be secured to the steps and side rails of a ladder; substantially as described.

4. In a step-ladder the combination of side rails, steps, folding legs and additional folding legs, and a rod extending through the folding legs, through the additional folding legs and through the side rails underneath the top step of the ladder, with means for securing each rod in place, the side rails of the step-ladder extending above each top step, the folding legs and the additional folding legs independently movable on the rod, as a pivot, whereby each folding leg or each additional folding leg may be used as the support of the side rails and steps, as preferred; substantially as described.

702,575. PHOTOGRAPHIC-FILM-PROTECTING STRIP. WILLIAM F. MARSH, Columbia, Pa. Filed Jan. 20, 1902. Serial No. 61,791. (No model.)

Claim.—1. A film-protecting strip having perforations forming designating-marks, and strips formed of non-sensitive material and of a contrasting color arranged at the rear of the protecting-strip to cover said perforations.

2. A film-protecting strip having perforations forming designating-marks, strips of a contrasting color so disposed as to cover said perforations, and an opaque material covering said colored strips.

3. A film-protecting strip having perforations forming designating-marks, strips of material of contrasting color arranged at the rear of the protecting-strip to cover said perforations, and an auxiliary strip of opaque material covering said colored strip.

4. A film-protecting strip formed of opaque material and adapted to be wound on the delivery and receiving roll-holders of a roll-film camera, said strip having on one side a plurality of longitudinal and vertically-disposed strips forming adjacent pockets for the reception of separated film-sections.

5. A film-protecting strip having a series of perforations forming designating-marks, strips arranged on one face of said protective strip to cover said perforations, the auxiliary strips being arranged to form pockets for the reception of sectional films.

702,576. CUP-CAKE-DROPPING APPARATUS. WILLIAM J. NIELSEN, Denver, Colo. Filed June 13, 1901. Serial No. 66,042. (No model.)

Claim.—1. In a cup-cake-dropping apparatus, the combination with a suitable tank having shallow cells in its bottom, the said cells having bottom openings while their side walls are closed, the tank being provided

with vertical guides extending above the cells and arranged to allow the dough to enter the cells between the guides, a cut-off slide normally held in position to close the openings of the cells, but having openings so arranged that when the slide is actuated, its openings are made to register with the openings in the bottom of the cells, and plungers movable vertically in the guides and adapted to enter the cells to eject their contents.

2. In a device of the class described, the combination with a suitable tank having shallow cells in its bottom, the said cells having bottom openings while their side walls are closed, the tank being provided with vertical guides extending above the cells and adapted to allow the dough to pass from the bottom of the tank to the cells, a cut-off slide normally held in position to close the openings of the cells, the said slide having openings arranged to register with the openings in the cells when the slide is actuated, plungers movable vertically in the guides and adapted to enter the cells to eject their contents, means with which the plungers are connected, means for connecting the plunger-stems, and means for simultaneously operating the series of plungers.

3. The combination with a suitable tank having sloping sides and shallow cells in its bottom, the said cells having bottom openings while their side walls are closed, the tank being provided with vertical guides extending above said openings and adapted to allow the dough to enter the cells when the plungers are raised, a cut-off slide normally held in position to close the openings of the cells, means for operating said slide, means for limiting the movement of the slide in both directions, the said slide having openings arranged to register with the openings in the bottom of the cells when the slide is properly actuated, plungers movable vertically in the guides and adapted to enter the cells to eject their contents, and suitable means for simultaneously operating the plungers.

4. In a cup-cake-dropping apparatus, the combination with a suitable tank having shallow cells in its bottom, the said cells having bottom openings, the tank being provided with vertical guides extending above said openings and adapted to allow the dough to pass between them into the cells when the plungers are raised, a cut-off slide normally held in position to close the openings of the cells, means for operating said slide which is slotted at one extremity, and a stationary device protruding through said slot in the slide whereby the movement of the slide is properly limited in both directions, the said slide having openings arranged to register with the openings in the bottom of the cells when the slide is actuated, plungers movable vertically in the guides and adapted to enter the cells to eject their contents, and suitable means for simultaneously operating the plungers.

702,577. WAVE-MOTOR. RUSSET MILLAR, Dunedin, New Zealand. Filed Apr. 8, 1902. Serial No. 101,914. (No model.)

Claim.—1. In a wave-motor, the combination of a suitable support, a power-shaft mounted on said support, a float, a connection between the float and support, such as to permit any movement of said float but that of twisting, and connections between three or more points on the outer edge of said float and said power-shaft.

2. In a wave-motor, the combination with a float and a power-shaft, of a beam, a connection between said beam and said float such as to permit any movement of said float but that of twisting, and connections between the outer edges of said float and said power-shaft.

3. In a wave-motor the combination of a suitable support, a power-shaft mounted on said support, clutch mechanism on said power-shaft for operating the same, a float, a jointed connection between the float and support such as to permit any movement of said float but that of twisting, flexible connections between the outer edges of said float and said clutch mechanism, and guides for said flexible connections located between said float and said clutch mechanism.

4. In a wave-motor, the combination with a float of a beam, a jointed connection between said beam and said float such as to permit any movement of said float but that of twisting, a power-shaft, clutch mechanism on said power-shaft for operating the same, flexible connections between the outer edges of said float and said clutch mechanism, and guides for said flexible connections, located between said float and said clutch mechanism.

702,578. ROD-PACKING. THOMAS W. HITCHCOCK, Omaha, Neb. Filed Sept. 18, 1901. Serial No. 73,222. (No model.)

Claim.—1. In a rod-packing, the combination with the stuffing-box, a cylindrical chamber therein and a removable cover, with an opening through said stuffing-box and cover of sufficient diameter for the two passages of the rod, of a packing-ring adapted to embrace the rod and having bearing-surfaces on its opposite sides of a follower adapted to press said ring against one end of the chamber, said follower being formed in sections with a cylindrical prolongation, and a spring surrounding said prolongation to hold the sections together and bearing against the opposite end of the chamber for advancing the follower; substantially as described.

2. In a rod-packing, the combination with the stuffing-box having the chamber therein, the removable cover having a chamber therein, said stuffing-box and cover having openings for the two passages of the rod and a sectional bushing for reducing the size of one of said openings, of a packing-ring having segments with springs for advancing the same into contact with the rod and parallel flat bearing-surfaces on opposite sides, a sectional follower for advancing the ring against the bushing, having a cylindrical prolongation, a spring surrounding said prolongation to hold the sections together and bearing against the opposite end of the chamber to advance the follower parallel with the rod; substantially as described.

3. In rod-packing, the combination with the stuffing-box having a cylindrical chamber therein, the removable cover having a cylindrical chamber therein of larger diameter than the chamber in the stuffing-box and a sectional bushing for reducing the size of the rod-opening in the cover and having a flat-face flange, of the packing-ring segments seating against said flat face with springs for advancing them against the rod, a sectional follower bearing against the side of the packing-ring opposite the bushing and having a cylindrical prolongation extending back into the chamber in the stuffing-box, and a spring located in said last-mentioned chamber for advancing the follower and having its forward coils around the cylindrical prolongation of the follower for holding the sections of the follower together; substantially as described.

702,579. COMPOUND TRUSS-RAIL. BENJ. T. MOGLAR, Pittsburgh, Pa. Filed Oct. 20, 1901. Serial No. 73,967. (No model.)

Claim.—1. A continuous compound rail consisting of a plurality of base members and a plurality of head members, each provided with interfitting web portions, overlapping each other, and connected together by securing means constituting an arch.

2. A continuous compound rail consisting of base members provided with a web portion and a square recess at the base thereof, head members provided with a web portion, and a square recess at the upper edge thereof, such members overlapping each other and connected together by securing means constituting an arch.

3. A continuous compound rail consisting of base members provided with a web portion and a square recess at the base thereof, head mem-

been provided with a web portion and a square recess at the upper edge thereof, such members overlapping each other and connected together by rivets arranged in the form of an arch between the joints.

4. A continuous compound rail consisting of base members provided with a web portion and a square recess at the base thereof, head members provided with a web portion and a square recess at the upper edge thereof, such members overlapping each other and connected together by rivets arranged in the form of an arch between the joints, and supplementary rivets located at intervals.

5. A compound-rail base member consisting of a vertical web having a square upper edge, a corresponding square recess at the base of the web, a flanged bottom, and provided with a series of rivet-holes through the web, arranged in the form of an arch.

6. A compound-rail head member consisting of a vertical web having a square lower edge, a corresponding square recess at the upper edge thereof, a wheel-base, and provided with a series of rivet-holes through the web, arranged in the form of an arch.

7. A compound rail consisting of a base member having flanges and a web, a head member having a head and a web, and means connecting the webs arranged in the form of an arch.

702,580. APPARATUS FOR PRODUCING GAS. THOMAS H. MULLIN, New York, N. Y. Filed Apr. 2, 1901. Serial No. 54,017. (No model.)

Claim.—1. In an apparatus for producing gas, the combination of a retort, a furnace for heating the same, a steam-pipe connected with the said retort and coiled around the same in the furnace in the path of the combustion-gases, and means for collecting the gas produced.

2. In a gas-producing apparatus, the combination of a retort having a feed end and a discharge end, means for heating the retort, and means for supplying a gas under pressure at each end of the said retort so as to prevent the entry of atmospheric air into the retort.

3. In an apparatus for producing gas, the combination of a retort, means for heating said retort, a feeder for the retort, a gas-pressure device located exteriorly of the retort, and a connection from said pressure device to a point on the opposite side of the feeder from the retort so that the gas under pressure will pass through the feeder with the material on its way to the retort.

4. In an apparatus for producing gas, the combination of a retort, means for heating said retort, a feeder for the retort, a gas-pressure device located exteriorly of the retort, and a double connection from said pressure device to points on opposite sides of the feeder so that a portion of the gas will pass through the feeder with the material and a further portion of the gas will be supplied to the material after its passage through the feeder.

5. In an apparatus for producing gas, the combination of a retort,

means for heating the same, a gas-pressure device located exteriorly of the retort, connections from said pressure device to both ends of the retort, and an outlet pipe or conduit leading from the central portion of the retort.

702,581. VENTILATOR. WILLIAM McDONNELL, Boston, Mass. assignor to Anna L. Wood, Boston, Mass. Filed Jan. 23, 1901. Serial No. 46,001. (No model.)

Claim.—1. A ventilator having a horizontal passage for the wind, and a vertical passage for the air, the wind in passing through said horizontal passage producing an exhaust effect for drawing the foul air out through the vertical passage, allowing mechanism for maintaining said ventilator in the direction of the wind, and means for permitting the free turning of the ventilator by said allowing mechanism, said means comprising a shaft provided with a plurality of stationary bearings at its lower end for giving lateral rigidity, and having a bearing at its upper end above the center of gravity of the ventilator, said bearing including a lower cone on the shaft and supporting the weight of all the apparatus.

a lower cup adjacent said cone, balls between the two for receiving the weight of the ventilator, an upper cone and cup, and balls between them for centering and balancing the ventilator, and a sleeve independent of the shaft and rigidly secured to the ventilator for transmitting the weight thereof to said lower cone and provided with means for retaining said movable bearing in place.

2. In a ventilator, a bearing for centering and supporting the ventilator and permitting it to turn freely in the direction of the wind, said bearing comprising a sleeve mounted in the upper side of the ventilator, a carrier secured rigidly in said sleeve and provided with an annular rib, a shaft passing loosely centrally through said rib and provided with a lower cone, a cup resting against the under side of said rib, balls traveling between said cone and said cup, said cone supporting the weight of the ventilator, a second cup carried by said rib on the upper side thereof, balls thereon, and an upper cone, said lower cone being integral with said shaft, and said upper cone being mounted adjustably on said shaft for co-operating with said upper cup and balls in centering and balancing the ventilator.

3. In a ventilator, a bearing for centering and supporting the ventilator and permitting it to turn freely in the direction of the wind, said bearing comprising a sleeve mounted in the upper side of the ventilator, a carrier secured rigidly in said sleeve and provided with an annular rib, a shaft passing centrally through said rib and provided with a lower cone, said cone being integral with said shaft and said carrier being independent of said shaft, a cup resting against the under side of said rib, balls traveling between said cone and said cup, the latter transmitting the weight of the ventilator from said rib to the lower cone to be borne by the latter, a second cup carried by said rib on the upper side thereof, balls thereon, and an adjustable cone mounted on said shaft for co-operating with said upper cup and balls in centering and balancing the ventilator, said shaft being threaded to receive said adjustable cone, and having a retaining nut and washer for maintaining the parts in adjustment.

4. In a ventilator, a bearing for centering and supporting the ventilator and permitting it to turn freely in the direction of the wind, said bearing comprising a sleeve mounted in the upper side of the ventilator, a carrier secured rigidly in said sleeve and provided with an annular rib, a shaft passing centrally through said rib and provided with a lower cone, said cone being integral with said shaft and said carrier being independent of said shaft, a cup resting against the under side of said rib, balls traveling between said cone and said cup, said cone supporting the weight of the ventilator from said rib to the lower cone, a second cup carried by said rib on the upper side thereof, balls thereon, and an adjustable cone mounted on said shaft for co-operating with said upper cup and balls in centering and balancing the ventilator, said shaft being threaded to receive said adjustable cone, and a false washer or bottom fitting tightly around said shaft within said sleeve below the bearing, said bearing being carried by said ventilator entirely above the air-passage thereof out of the way of the smoke and gas.

5. In a ventilator, a conical funnel, a second conical funnel within the same, providing a conical passage between the two for the passage of wind, and a stationary, vertical shaft for supporting said ventilator and permitting the same to follow the direction of the wind, said shaft having a movable bearing at its upper end, comprising a tubular sleeve or shell provided with a flange at its lower end and secured to the inner side of said sleeve and immovably secured thereto, said carrier having a heavy annular rib extending laterally transversely of said shaft, and a cone, cup and balls mounted on opposite sides of said rib about said shaft, for the rotation of the ventilator, the cone being rigid with the shaft, the lower cup bearing all the weight and downward thrust, and the upper cup receiving the sidewise thrust and acting to center the ventilator and maintain it steady.

702,582. PROCESS OF RECOVERING METALS FROM ORES. JAMES W. HILL and JOSEPH H. BISHOP, Salt Lake City, Utah. Filed Feb. 6, 1901. Serial No. 46,172. (No specimens.)

Claim.—1. The herein-described improvement in leaching copper ores, consisting in forcing sulfuric-acid gas through a charge of pulp to agitate the same mechanically and thereby assist in the leaching action, separating the solution from the ore, recovering the metal from such solution, thereby releasing the gas and returning the gas released by such operation for use in agitating and dissolving the metal from fresh charges of ore.

2. The herein-described improvement in leaching copper ores consisting in forcing sulfuric-acid gas through a charge of pulp to agitate the same mechanically and thereby assist in the leaching action, separating the solution from the ore, recovering the metal from the solution thereby releasing the gas and returning the sulfuric-acid gas released by the precipitating process for use in agitating and dissolving metal from fresh charges of ore.

3. The herein-described improvement in leaching copper ores con-

sisting in subjecting the ore-pulp to successive leaching operations in a series of tanks and forcing through the tanks in succession a gas containing the solvent agent, beginning with that tank in which the ore is subjected to the final leaching operation, as and for the purpose described.

4. The herein-described improvement in treating ores in metallurgical operations consisting in subjecting the ore to successive operations in a series of tanks and forcing through the tanks in succession a gas containing the treating agent beginning with that tank in which the ore is subjected to the final operation and ending with that tank in which the ore is subjected to the initial treatment, as and for the purpose described.

5. The herein-described improvement in treating ores, consisting in forcing sulfuric-acid gas through a charge of pulp to agitate the same mechanically and to assist in the leaching action, then filtering the pulp to obtain the metal-bearing solution, precipitating the metal from such solution thereby releasing the gas and returning the sulfuric-acid gas released by the precipitating process for use in agitating and dissolving metals from fresh charges of ore.

6. The herein-described improvement in treating copper or other ores, consisting in agitating a charge of pulp containing the ore by gas from roasting-furnaces charged with material suitable for producing sulfuric-acid gas, separating the resultant solution, precipitating the metal from the solution thereby releasing gas and employing the sulfuric-acid gas released by the precipitating process to enrich the gas derived from the furnace and used in leaching a charge of ore.

702,583. CRANBERRY-SORTING APPARATUS. ALVIN E. HENTENBACH, Plymouth, Mass. Filed Aug. 31, 1901. Serial No. 73,908. (No model.)

Claim.—1. An apparatus for sorting cranberries, comprising a frame, a removable rack, consisting of two longitudinal strips with diagonal

essally disposed ends, a series of rollers journaled in said strips, cross-pieces mounted between said rollers, and fastened to said strips, cleats supporting said rack, and a longitudinally-movable stop-carrying rack, held in contact with the roller-carrying rack, as set forth.

2. An apparatus for ascertaining cross-berries, comprising in combination with the frame, a removable roller-carrying rack, having its ends diagonally disposed, cleats on which said rack is supported, cross-pieces fastened to said rack, and positioned between the rollers, a longitudinally-movable rack and stops carried thereby, cross-pieces I, against which the upper ends of the racks contact, and a wedge underneath said stop-carrying rack, provided to hold the latter against the under edges of said strips I, the adjacent longitudinal edges of said racks, adapted to be held in contact with each other, as shown and described.

702,584. OIL-TANK. JOHN J. FAUGHT, New Orleans, La. Filed Feb. 6, 1902. Serial No. 90,946. (No model.)

Claim.—1. In the closure described, the combination of a tank having a drum provided with interior hoops-hugs at diametrically opposite points, and also having an exterior trough around its upper portion, and a sealing substance in said trough, a cover having a depending flange disposed in the trough of the drum, a bar arranged in the drum with its ends in engagement with the hoops-hugs thereof, and a connection between an intermediate part of the bar and the cover; the said bar being of such strength that it will retain the cover in position under normal conditions, and yet give way and release the cover when extraordinary pressure less than that necessary to burst the tank is developed therein.

2. An oil-tank having a filling-drum, means for closing the upper end of said drum, an oil-straining diaphragm disposed in said drum, a diaphragm of fine wire-gauze capable of retaining the passage of fire, disposed in the drum below the oil-straining diaphragm, an oil-inlet pipe connected to the drum above the straining-diaphragm and adapted to be connected with a supply-tank, a gas-outlet pipe also connected with the drum above the oil-straining diaphragm and adapted to be connected with the said supply-tank, and wire-gauze arranged in the drum over the end of said gas-outlet pipe.

702,585. GRATE-BAR. HENRY B. PARSON, Brooklyn, N. Y. Filed Sept. 29, 1900. Serial No. 733,083. (No model.)

Claim.—1. A grate-bar provided with longitudinal rows of tapering perforations arranged in staggered position relatively to one another, and a longitudinal rib of serpentine shape integral with said bar at its under side, the undulations of said rib extending in the spaces between and tangentially to the perforations of the central group of longitudinal rows of perforations of the bar, substantially as set forth.

2. The combination of two adjacent grate-bars provided with alternate interlocking tongues and recesses, and intermediate straight connecting portions between said tongues and recesses, said tongues being provided with corrugations at their edges, and a tubular transverse supporting-bar for the adjacent ends of the grate-bars, substantially as set forth.

702,586.

702,586. WINDOW FRAME AND SASH. ABRAHAM RAMMER, Pittsburg, Pa., assignor to Rammer & Dinger Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Jan. 21, 1900. Renewed Apr. 30, 1902. Serial No. 100,200. (No model.)

Claim.—1. In a metallic frame and sash, the combination of a frame, comprising the top, bottom, and side pieces, the side pieces having grooves formed in the face thereof for the reception of the parting and bead strips, whereby guides are formed, the said parting-strip being formed of a strip of metal, the ends of which are brought together when inserted in the grooves, the tension thereof maintaining the same therein, and metallic mashes, comprising the top, bottom, and sides, substantially as set forth.

2. In a metallic frame and sash, the combination of a frame, comprising the top, bottom, and side pieces, the side pieces having grooves formed in the face thereof for the reception of the parting and bead strips, whereby guides are formed, the said parting-strip being formed of bent metal, the ends or edges of which are compressed in and inserted in the grooves, the tension thereof maintaining the same therein, and metallic mashes, comprising the top, bottom, and sides having grooves formed in the face of the same for the reception of the glass, substantially as set forth.

3. In a fireproof window, the combination, with the frame, having a channel formed therein, of an expansible guide strip or stop seated in said channel, and a sash held in place by said strip or stop, substantially as set forth.

4. A window-frame, composed of sheet metal, the sides of which are provided with vertically-disposed grooves, detachable beads, and detachable parting-strips mounted therein, substantially as set forth.

5. The combination, with a sheet-metal window-frame, of sheet-metal mashes, the frame having detachable beads of sheet metal and detachable parting-strips, the frame being provided with grooves in which said beads and parting-strips are placed, substantially as set forth.

6. The combination, with a sheet-metal window-frame, of sheet-metal mashes, the frame having detachable beads of sheet metal, and detachable parting-strips, the said parting-strips being strips of sheet metal folded longitudinally, the frame being provided with grooves in which said beads and parting-strips are placed, substantially as set forth.

7. A metallic window-mash comprising the parts d' and d'' , the said part d' having U-shaped flanges adapted to receive the bent ends of the part d'' , substantially as set forth.

8. The combination, with a sheet-metal window-frame, of sheet-metal mashes, the frame having detachable guide-strips of sheet metal, said guide-strips being strips of metal folded longitudinally, the frame being provided with grooves in which said guide-strips are placed, substantially as described.

702,587. WINDOW FRAME AND SASH. ABRAHAM RAMMER, Pittsburg, Pa., assignor to Rammer & Dinger Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Jan. 24, 1900. Serial No. 702,521. (No model.)

Claim.—1. As a new article of manufacture, a hollow metallic frame for windows, comprising parts 1, 2, 3, and 4, part 2 forming the outer edge of the frame and having an exterior stop or guide for the sash integral therewith, and an inward U-shaped groove, and part 3, the inner edge of the frame, being formed in two sections, and having an outwardly-projecting rib forming the parting-strip, the lower one of said sections, or that below the meeting-rib of the sash, being detachably secured to parts 2 and 4, whereby the same may be removed to enable access to be had to the interior of the frame and the removal of the sash, substantially as set forth.

2. As a new article of manufacture, a hollow metallic frame for windows comprising parts 1, 2, 3, and 4, part 2 forming the outer edge of the frame and having an exterior stop or guide for the sash integral therewith, and an inward U-shaped groove, and part 3 the face of the frame being formed in two sections and having an outwardly-projecting rib forming the parting-strip, and a stop integral therewith the lower of said sections or that below the meeting-rib of the sash being detachably secured to the parts 2 and 4, whereby the same may be removed to enable access to be had to the interior of the frame and the removal of the sash, substantially as set forth.

3. A hollow metallic sash the side rails of which are formed of a body-piece 5 and a piece 6 having an inwardly-projecting recess or channel the said parts terminating in U-shaped hooks adapted to interlock, said piece 6 being inside of the outer side edges of the body part 5, whereby they are kept out of contact with the stationary frame substantially as herein set forth.

4. A hollow metallic sash the side rails of which are formed of a body-piece 5 and a piece 6 having an inwardly-projecting recess or channel, the ends of said piece 6 terminating in U-shaped hooks adapted to interlock with correspondingly-shaped hooks or flanges of the body-piece, said part 6 being supported by the part 5 out of contact with the stationary frame and the top rail of said sash having a removable or detachably-secured top for the purpose of enabling the glass to be inserted in the sash, substantially as set forth.

5. A hollow metallic sash the side rails of which are formed of two independent parts 5 and 6, part 5 forming the body of the side rail its inner edges terminating in U-shaped hooks in which the correspondingly-shaped parts of the part 6 are adapted to interlock, the outer edge of said part 5 having a channel centrally of the same longitudinally for the reception of the glass, the said part 6 projecting outwardly into said part 5 forming a channel for the reception of the cord or chain and having its surfaces supported out of contact with the stationary frame, substantially as set forth.

6. A metallic sash for windows, having a horizontal rail consisting of separable halves adapted to receive the glass between them and being provided with flanges, an outer fastening-strip having flanges adapted to engage the flanges on the rail, a clamping-strip engaging the flanges on the rail, and detachable fasteners connecting the fastening-strip to the clamping-strip, whereby the halves of the rail are held together.

7. A metallic sash for windows having upright members constituting its sides each of which consists of a box-like or hollow body-piece having two free portions, and an independent or separate strip for the outer face of the body, said strip being attached to the free portions of the body-piece and provided with a channelled portion recessed in the hollow body-piece and curving to meet the sash-cord.

702,588. WINDOW FRAME AND SASH. ABRAHAM RAMMER, Pittsburg, Pa., assignor to Rammer & Dinger Company, Pittsburg, Pa., a Corporation of Pennsylvania. Original application filed Jan. 21, 1900. Serial No. 907,593. Divided and this application filed July 30, 1902. Serial No. 23,270. (No model.)

Claim.—1. A window-frame composed entirely of sheet metal bent up to form a hollow body having top, bottom, and side members, the walls of said side members adjacent to the mashes being formed in two sections the lower one of which is detachably secured to the body of said side members and the said walls being pressed or bent to form outwardly-projecting ribs which form the sides of channels or grooves for the retention of the mashes, substantially as set forth.

2. A window-frame composed entirely of sheet metal bent up to form a hollow body having top, bottom, and side members, the walls of said side members adjacent to the mashes being formed in two sections the lower one of which is detachably secured to the body of said side members and the said walls being pressed or bent to form outwardly-projecting ribs which form the sides of channels or grooves for the retention of the mashes, substantially as set forth.

3. A window-frame composed entirely of sheet metal bent up to form a hollow body having top, bottom, and side members, the walls of said side members adjacent to the mashes being formed in two sections the lower one of which is detachably secured to the body of said side members and the said walls being pressed or bent to form outwardly-projecting ribs which form the sides of channels or grooves for the retention of the mashes, in combination with counterbalance-weights operating in said hollow side members and the mashes connected with said weights, substantially as shown and described.

4. In a fireproof window, a sash having a hollow sheet-metal top rail slotted vertically for the introduction of the window-glass, the edges of the top of said top rail having downwardly-projecting prongs adapted to be detachably secured in the loop on the body of said rail, substantially as set forth.

5. In a fireproof window, a sash having a hollow sheet-metal top rail slotted vertically for the introduction of the window-glass, the body of said rail terminating on top in separated downwardly-bent lips forming guides, and a slide forming the top of said rail and substantially flush with the vertical front and rear faces of the rail-body, said slide being movable lengthwise of the body of the rail, into and out of engagement therewith and having guides engaging the guides on the rail-body and consisting of lips bent around the said lips or guides on the rail-body.

6. In a fireproof window, the combination with a frame composed of sheet metal having its side members bent to form three sides of an inclosure, the end wall forming the fourth side of said inclosure, said end wall having the extreme edges doubled back upon themselves, to form grooves, and the other having its edges fitted into said grooves, and said end wall being provided with an inward-curved sheet-metal partition dividing said inclosure into two compartments, and said frame having a part thereof arranged to engage with the masonry of the wall, substantially as described.

7. In a fireproof window, the combination with a frame, of a sash having at each side a vertical part composed of two strips of metal, the outer one of which constitutes one of four margins of the sash while the inner one is bent at an angle to form a ridge or flange extending lengthwise of said outer strip, said strips being secured together by the edges of one sliding around the edges of the other.

8. A window-frame having hollow metallic side walls adapted for

the guiding of the respective window-cases and provided with a transverse partition extending substantially thereacross, which defines independent chambers for the movement of the anti-weights.

9. A window-frame having hollow metallic side walls or members comprising a back piece, side piece, and an outer or front piece which is adapted for the guiding of the window, all of said pieces being independently constructed, and being attached to each other.

10. A window-frame having hollow metallic side walls or members comprising a back piece, side piece, an outer or front piece, and an interior partition-piece, said front piece being adapted for guiding the window and the partition being adapted for preventing interference of the anti-weights, all of said pieces being independently constructed, and being attached to each other.

702,589. BICYCLE-POST CLAMP. JULIAN H. RASE, Charleston, S. C. Filed Nov. 12, 1901. Serial No. 22,745. (No model.)

Claim.—1. A bicycle-post clamp adapted for fastening at variable heights to the post-stem and having a laterally-movable part adapted to mark the bicycle-frame for precisely indicating the place of boring said frame to later receive said laterally-movable part for preventing accidental detachment of the post-stem from the bicycle-frame, substantially as described.

2. A bicycle-post clamp adapted for fastening at variable heights to the post-stem and comprising a collar having a part adapted to interlock laterally with the bicycle-frame to prevent sideways turning of the post-stem and saddle on the frame and also having a laterally-movable part adapted to mark the bicycle-frame for precisely indicating the place of boring said frame to later receive said laterally-movable part for preventing accidental detachment of the post-stem and saddle from the bicycle-frame, substantially as described.

3. The combination, with a bicycle-frame having a notch 8 and an oppositely-arranged hole 13, and a post-stem having a stem or spring-barrel entering the frame, of a collar 2, vertically adjustable on the post-stem or barrel and having a lug 5 adapted to the frame-notch 8 and also having a latch-bolt 10 and a spring 12 normally forcing said bolt into the frame-hole 13 when the collar-lug 5 is engaged with the frame-notch 8; said bolt being adapted when the lug 5 is first entered into the frame-notch 8 to mark the frame to precisely indicate the place for boring the hole 13 which later receives it, substantially as described.

702,590. PUMP. JOHN W. REYNOLDS, Babylon Spa, N. Y. Filed Mar. 21, 1901. Serial No. 22,188. (No model.)

Claim.—1. A pump-comprising a pair of hard-metal sections bolted together, an opening *c* being formed in one side of the meeting portions of said sections, one of the latter having a central inlet shouldered opening *a* in one side of the casing and the other having the centrally-disposed stuffing-box *c'* having an annular shoulder therein in the opposite side of the casing, said sections being further provided with outwardly-flared openings, said casing having a lead flange thereon and

formed integrally with tapered projections in said flared openings, said flange being contained into the said stuffing-box and through the said inlet-opening and engaged with the shoulder of the stuffing-box and inlet-opening, substantially as described.

2. A centrifugal pump casing, of hard material having a shouldered inlet-opening in one side, a shouldered stuffing-box in the other, and a lining of soft material, said lining having integral portions extending into and through said opening and stuffing-box and engaged with the shoulder thereof, substantially as described.

702,591. POWDER FILLING AND FOLDING MACHINE. FRANK A. RICHMOND, Auburn, N. Y., assignor, by direct and mesne assignments, to Morris Lory, New York, N. Y. Filed Apr. 1, 1901. Serial No. 22,905. (No model.)

Claim.—1. In a wrapping-machine, the combination with wrapper-folding mechanism, of a hopper, and mechanism for feeding material from the hopper to the wrapper comprising an expandable spiral feeder and means within the feeder for expanding the helices of the spiral.

2. In a wrapping-machine, the combination with wrapper-folding mechanism, of a supply-hopper for the material to be wrapped, a spiral feeder for conveying the material from the hopper to the wrapper, and a single operating member having means actuated thereby for expanding the spiral feeder.

3. In a wrapping-machine, the combination with wrapper-folding mechanism, of a supply-hopper for the material to be wrapped, a feeder for the material comprising a spiral web, and rotary means engaged with the helices of the spiral web for expanding the same.

4. In a wrapping-machine, the combination with wrapper-folding mechanism, of a supply-hopper for the material to be wrapped, a dis-

charge-rod therefor, an expandable spiral feeder for the material operable within the means for expanding and contracting the helices of the spiral, and a single member to operate said means.

5. In a wrapping-machine, the combination with wrapper-folding mechanism, of a supply-hopper, and an expandable feeder comprising a tubular shaft, a spiral web, and a threaded stem operatively connected to portions of the spiral web.

6. In a wrapping-machine, the combination with wrapper-folding mechanism, of a supply-hopper, and an expandable feeder comprising a tubular shaft, a spiral web, a threaded stem, and a plurality of nuts attached to the spiral web at intervals and operatively associated with the threaded stem.

7. In a wrapping-machine, the combination with wrapper-folding mechanism, of a supply-hopper and an expandable feeder comprising a tubular shaft, a spiral web, and threaded stem having threads of different pitch and a plurality of nuts attached to the spiral web at intervals and operatively associated with the threaded stem.

8. In a wrapping-machine, the combination with wrapper-folding mechanism, of a supply-hopper and an expandable feeder comprising a tubular shaft provided with a spiral slot; a threaded stem, and a plurality of nuts attached to the spiral web at intervals and operatively associated with the threaded stem and working in the spiral slot.

9. In a wrapping-machine, the combination with wrapper-folding mechanism and means for feeding material to the wrapper, of a reel and independently-movable means carried by the reel for covering and folding the wrapper.

10. In a wrapping-machine, the combination with wrapper-folding mechanism, and means for feeding material to the wrapper, of a reel having wrapper-grippers, a wrapper-covering and end-folding device carried by the reel, and means for intermittently actuating the gripping, covering, and folding device.

11. In a wrapping-machine, the combination with wrapper-folding mechanism, and means for feeding material to the wrapper, of a reel having wrapper gripping, covering and end-folding devices carried by the reel, a stationary cam for operating the gripping devices and independent means for operating the covering and end-folding devices.

12. In a wrapping-machine, the combination with wrapper-folding mechanism, and means for feeding material to the wrapper, of a reel having oscillatory wrapper-grippers carried by the reel, pivotally-mounted end-folding devices on the reel, an operative connection between said end-folding devices and means for imparting movement to one of the end-folding devices.

13. In a wrapping-machine, the combination with wrapper-folding mechanism, and means for feeding material to the wrapper, of a reel having oscillatory wrapper-grippers carried by the reel, pivotally-mounted end-folding devices also on the reel, an operative connection between said end-folding devices whereby one actuates the other, means for actuating one of said devices and a release-spring connected with the other end-folding device.

14. In a wrapping-machine, the combination with wrapper-folding mechanism, and means for feeding material to the wrapper, of a reel having wrapper-gripping and end-folding devices, and means for crimping the end folds of the wrapper.

15. In a wrapping-machine, the combination with wrapper-folding mechanism, and means for feeding material to the wrapper, of a reel having wrapper-gripping and end-folding devices having means for forming crimps across the end folds of the wrapper.

702,592. GANG-EDGER SAWING-MACHINE. ALPHRED E. ROE, New Whetson, Wash., assignor to himself and Bruce Cornwall, San Francisco, Cal. Filed Jan. 2, 1902. Serial No. 192. (No model.)

Claim.—1. In a gang-edger, the combination of a saw-arbor; a series of saws mounted thereon; a series of slides of like form and dimension, having their outer ends at an angle to the body of the slide; and connections between said slides and the saws.

2. In a gang-edger, the combination of a saw-arbor; a series of saws mounted thereon; a series of slides of like form and dimension, having their outer ends at an angle to the body of the slide; an arm connected

to each of said slides; a guide for said slides and arms; and connections between said slides and the saws.

3. In a gang-edger, the combination of a saw-arbor; a series of saws mounted thereon; guides or ways adjacent to said arbor; a series of slides of like form and dimension, mounted on said ways; said slides having a straight body portion with their outer ends bent at an angle thereto; an arm extending from each of the slides at an angle to the straight portion and in a direction opposite to that of the bent portion of the slides; a guide for said slides and arms, and connections between said slides and the saws.

4. In a gang-edger, the combination of a saw-arbor; a series of saws mounted thereon; guides or ways; a series of slides of like form mounted thereon, said slides having their outer ends bent at an angle substantially as described; arms extending from the under face of the slides to one of the guides; means for holding the slides in their adjusted position; and connections between said slides and the saws.

5. In a gang-edger sawing-machine, the combination of an arbor, a saw longitudinally movable thereon, a shifting device engaging said saw, said device having arms, diverging obliquely, one on each side thereof and a guide in which the extended ends of said arms slide, the arms extending in one direction sliding on one portion of said guide and these in the other direction on another portion thereof, substantially as described.

6. In a gang-edger sawing-machine, the combination of an arbor a saw longitudinally movable thereon, a shifting device engaging said saw, said device having upper and lower spreading-arms, the upper arm of one shifter being adapted to pass over the lower arm of an adjoining shifter, and a guide on which the extended ends of the arms slide, substantially as described.

7. In a gang-edger sawing-machine, the combination of an arbor, a saw longitudinally movable thereon, a shifter for shifting said saw longitudinally, said shifter extending symmetrically and equally on both sides of the plane of the saw, and from the front to the rear thereof, and being provided at the front with means for operating said shifter, and a spreader carried in the plane of the saw by the rear end of said shifter, substantially as described.

8. In a gang-edger sawing-machine, the combination of a frame, a saw at one end, an arbor, a battery of saws longitudinally movable on said arbor, said saws being adapted to receive said battery when not in use, and a shifter for shifting said battery along said arbor, substantially as described.

702,598. SAFETY DEVICE FOR RAILWAY POINTS OR SWITCHES. RAYMOND, RUMBLE, Belgium. Filed Mar. 12, 1902. Serial No. 22,721. (No model.)

Claim.—1. In a safety device for insuring the closing of switch-points before the passage of the wheels over said points, the combination of a pivoted lever, a pedal on one end of said lever in such position as to

be depressed by a portion of a wheel approaching the switch, a spring adapted to normally hold up said pedal, a pyramidal head mounted on said lever, a block having an edge and two beveled faces adapted to be engaged by said pyramidal head, and means for connecting said block to the switch-points, whereby the throwing over of said points to one side or other is insured before the wheel reaches the switch-points.

2. In a safety device for locking switch-points in a closed position and maintaining them closed until a predetermined time after the passage of the wheels, the combination of a pivoted lever, means for resiliently holding up said lever, a pedal connected to said lever and adapted to be depressed by a wheel approaching the points, means connected to the switch and adapted to be operated upon by said lever to lock the switch-points, an arm upon said lever, a rod attached to said arm, two pistons mounted upon said arm with a space between them, cylinders in which said pistons are adapted to operate, a box in communication between said cylinders, a fluid between said pistons, a valve mounted to slide upon the rod in said box between said pistons, means for holding said valve normally against the end of the foremost cylinder and notches in said rod, whereby the return of the fluid into the foremost cylinder is allowed to take place slowly, and the release of the switch-points is retarded.

3. In a safety device for insuring the closing of switch-points and for maintaining them closed until a predetermined time after the passage of a wheel over said points, the combination of a pivoted lever, means for resiliently holding up said lever, a pedal upon said lever adapted to be operated by a wheel approaching the points, a locking-head upon said lever, means connected with the switch adapted to be engaged by said head, a pair of fluid-pressure cylinders, pistons fitting in said cylinders, means for connecting said pistons to said lever, and means for permitting the passage of the fluid out of one cylinder and for retarding the return of the fluid, whereby the throwing over of the points in one direction or other is insured, and whereby the release of the point-locking device is retarded.

702,594. CARTRIDGE-CARRIER. EDWIN M. ROSENBLUTH, Philadelphia, Pa. Original application filed Feb. 4, 1899. Serial No. 704,422. Divided and this application filed Dec. 14, 1899. Serial No. 749,008. (No model.)

Claim.—1. A carbid-cartridge, comprising an outer shell, a removable partition, forming separate carbid-compartments within said shell, and means arranged to retain said partition in normal relation with said shell, substantially as set forth.

2. A carbid-cartridge, comprising an outer shell, a removable partition, forming separate carbid-compartments within said shell, and removable means arranged to retain said partition in normal relation with said shell, substantially as set forth.

3. A carbid-cartridge, comprising an outer shell, a removable partition, forming separate carbid-compartments within said shell, and resilient means arranged to retain said partition in normal relation with said shell, substantially as set forth.

4. A carbid-cartridge, comprising an outer cylindrical shell, a removable cylindrical partition, forming separate carbid-containing compartments within said shell, and resilient means, attached to said partition, arranged to maintain the same in normal relation with said shell, substantially as set forth.

5. A carbid-cartridge, comprising an outer cylindrical shell, a removable cylindrical partition, forming separate concentric carbid-containing compartments within said shell, and resilient means, attached to said partition, arranged to normally maintain the same in concentric relation with said shell, substantially as set forth.

6. A carbid-cartridge, comprising an outer shell, formed of separable telescoping members, opposed ends in said respective members, a partition fitted at its opposite extremities to said ends and arranged to form a plurality of compartments within said shell, an opening in said shell in communication with one of said compartments, a porous diaphragm extending across said opening, and removable means to seal said opening, substantially as set forth.

7. A carbid-cartridge, comprising an outer shell, an opening in said shell provided with a neck, corrugations in said shell, adjoining said neck, a porous diaphragm resting upon said corrugations, and extending across said neck, and removable means to seal said neck, substantially as set forth.

8. In a carbid-cartridge, comprising an outer shell; including a plu-

rality of compartments; a hopper fitted concentrically to said shell and arranged to deliver carbid to a predetermined one of said compartments, substantially as set forth.

9. In a carbid-cartridge, comprising an outer shell; an opening in said shell provided with a neck in integral relation with said shell; a porous diaphragm secured across said neck; a removable cap arranged to seal said neck exterior to said diaphragm; and a recessed portion of said cap, arranged to support said diaphragm, substantially as set forth.

10. In a reversible carbid-cartridge, comprising an outer shell; openings in opposite extremities of said shell respectively provided with necks in integral relation with said shell; a partition intermediate of the necked extremities of said shell; and removable means to seal said necks, substantially as set forth.

702,595. CARRIAGE-LAMP. EDWIN M. ROSENBLUTH, Philadelphia, Pa. Filed Sept. 12, 1900. Serial No. 20,502. (No model.)

Claim.—1. In a lamp, the combination with a casing provided with a burner; of a plurality of interchangeable fluid-containing receptacles removably supported by the casing, each of said receptacles being adapted to be brought into communication with the burner, substantially as set forth.

2. In a lamp, the combination with a casing provided with a burner; of a plurality of interchangeable fluid-containing receptacles removably supported by the casing, substantially as set forth.

3. In a lamp, the combination with a casing provided with a burner; of a plurality of interchangeable fluid-containing receptacles supported by the casing, and detachably connected to each other, substantially as set forth.

4. In a lamp, the combination with a burner; of a plurality of oil-receptacles adapted to be operatively connected with said burner; one of said receptacles being provided in its bottom with a cap for removably attaching a counterpart receptacle thereto; the said oil-receptacles being reversible to bring them successively into communication with the burner, substantially as set forth.

5. In a carriage-lamp, the combination with a removable burner; of a flame-chamber inclosing said burner, comprising three integral side walls, and a separate door in movable relation therewith; a floor for said chamber uniting said side walls; a roof for said chamber uniting said side walls; a chimney in said roof; a removable oil-receptacle operatively connected with said burner; a draft-chamber inclosing said receptacle; a removable cap for the bottom of said draft-chamber; reflector-recesses respectively fixed in one of said side walls and in said door; exterior openings for said reflectors; air-chambers intermediate of said reflectors and their respective casings; and air-vents for said reflector air-chambers, substantially as set forth.

702,596. PIPE CONNECTION. GEORGE F. RYAN, Chicago, Ill. Filed Sept. 27, 1901. Serial No. 79,719. (No model.)

Claim.—1. The combination of an earthenware pipe provided with interior screw-threads, a metal fitting provided with a sleeve having exterior screw-threads, said earthenware pipe having an annular shoulder and the fitting being provided with an annular bearing-face which opposes the shoulder when the sleeve is inserted in said pipe, and a packing ring or gasket located between said shoulder and the said annular bearing-face of the fitting, and a bolt connecting said fitting with the earthenware pipe to prevent the turning of the said sleeve in the pipe.

2. The combination of an earthenware pipe provided with interior screw-threads of large size and rounded form, a metal fitting provided with a sleeve provided with exterior screw-threads corresponding with those of the pipe, said pipe being provided with an annular shoulder and the fitting having an annular bearing-face which opposes the said shoulder when the sleeve is inserted in the pipe, and an annular packing or gasket located between said shoulder and said annular bearing-face.

3. The combination of an earthenware pipe provided with interior screw-threads, a metal fitting provided with a sleeve having exterior screw-threads, said pipe having an annular shoulder and a flange exterior thereto forming a bell, and the fitting being provided with a radial flange which forms a bearing-surface opposing the said shoulder, a gasket between said shoulder and annular bearing-surface, and a filling of cement or the like applied in the said bell over the said flange.

4. The combination of an earthenware pipe provided with interior screw-threads, a metal fitting provided with a sleeve having exterior screw-threads, said pipe having an exterior annular shoulder, and the fitting having an exterior sleeve which embraces the end of the pipe and which is provided with an annular bearing-surface, and a gasket interposed between said shoulder and annular bearing-surface.

5. The combination of an earthenware pipe provided with interior screw-threads, a metal fitting provided with an annular shoulder and the fitting having an exterior sleeve which embraces the end of the pipe and which is provided with a radial flange on which is formed an annular bearing-surface opposing said shoulder on the pipe, a gasket interposed between said annular shoulder and bearing-surface, and a filling of cement or the like applied within said bell over said radial flange.

6. The combination of an earthenware pipe and an exterior separate earthenware sleeve having a shoulder and with a flange exterior thereto to forming a bell, said sleeve being secured in place on the pipe by cement.

7. The combination with an earthenware pipe, a separate earthenware sleeve surrounding the pipe and provided with a shoulder and with a flange exterior thereto forming a bell, a fitting provided with an interior sleeve which enters the pipe and with an exterior sleeve which embraces the end of the said pipe, said exterior sleeve having an annular bearing-surface opposing the shoulder on said exterior earthenware sleeve, and a gasket interposed between said shoulder and the annular bearing-surface on said exterior sleeve of the fitting.

8. The combination of an earthenware pipe provided with interior screw-threads, a fitting provided with a sleeve having exterior screw-threads, and a bolt engaging said fitting and passing endwise through the wall of said pipe.

9. The combination of an earthenware pipe provided with interior screw-threads, an earthenware sleeve surrounding said pipe and provided with an annular shoulder and a flange exterior thereto forming a bell, a fitting provided with an interior sleeve having exterior screw-threads and with an exterior sleeve which embraces the end of the pipe and has at its end a radial flange, a gasket interposed between said flange and the annular shoulder on the earthenware sleeve, and a filling of cement applied in said bell over the said radial flange on the exterior sleeve of the fitting.

10. The combination of an earthenware pipe provided with interior

screw-threads, an earthenware sleeve surrounding said pipe and provided with an annular shoulder, a fitting provided with an interior sleeve having exterior screw-threads and with an exterior sleeve which surrounds the end of the pipe and is provided with an annular bearing-surface, a gasket interposed between said shoulder and annular bearing-surface, and a bolt engaging the said fitting and passing endwise through the wall of the said pipe.

702,597. STEAM COOKING APPARATUS. WILLIAM C. SALMON, Washington, D. C. Filed July 19, 1901. Serial No. 64,326. (No model.)

Claim.—1. In a steam cooking apparatus, the combination with a boiler and a series of food-cooking sections superimposed upon the boiler, a pipe for conveying steam from the boiler to each of said sections, a flange-receptacle located in one of said sections, and means for discharging the liquid of condensation from the other sections into said receptacle.

2. In a steam cooking apparatus, the combination with a boiler and a series of food-cooking sections superimposed upon the boiler, a steam-pipe located wholly within each section for conveying steam from the boiler to the several sections, a bellows cap having a reduced upper end located within the pipe of the lower food-cooking section and curving to direct the liquid of condensation from the upper sections into said lower section and preventing said liquid from entering the boiler.

3. In a steam cooking apparatus, the combination with a boiler, and a series of food-cooking sections superimposed upon the boiler, a steam-pipe for conveying steam from the boiler to each of said sections, and means for directing the liquid of condensation from the several sections into the lower food-cooking section and preventing said liquid from entering the boiler.

4. In a steam cooking apparatus, the combination with a boiler and a series of food-cooking sections superimposed upon the boiler, a steam-pipe for conveying steam from the boiler to the several sections, a bellows cap having a reduced upper end fitted upon the end of the steam-pipe in the lower food-section, and an inclined flange on said cap curving to direct the liquid of condensation from the upper sections into said lower food-section.

5. In a steam cooking apparatus, the combination with a boiler and a series of food-cooking sections, superimposed upon the boiler, a steam-pipe for conveying steam from the boiler to the several sections, a flange-receptacle located in the lower food-section, and means for discharging the liquid of condensation from the several upper sections into said receptacle and for preventing said liquid from entering the boiler.

702,598. FURROW-OPENER FOR DINK GRAIN-DRILL. ROBERT H. SCHLAGETER, Clay Center, Neb. Filed Dec. 31, 1901. Serial No. 87,960. (No model.)

Claim.—1. In combination with a standard having an outwardly-projecting axle-spindle, and a shoulder at the base thereof, an annular washer-plate detachably secured to the standard, bearing on the said shoulder and disposed concentrically with relation to the axle-spindle, a cap having a box revolvable on the axle-spindle, bearing against the shoulder at the base thereof and having an annular channel in which the washer-plate is disposed and a disk having a central opening to clear the said shoulder, the said cap being secured concentrically to the said disk and the latter being disposed on one side of the washer-plate, substantially as described.

2. A standard having outwardly-projecting axle-spindles on opposite sides thereof, and formed with shoulders at the base of said axle-spindles, in combination with washer-plates bearing on the said shoulders and detachably connected together and to the standard, disks having central openings to clear the said shoulders, the said disks being disposed on the inner sides of the washer-plates, and caps formed with bearings revolvable on the axle-spindles and with recesses on their inner sides to receive the washer-plates, the said caps being detachably secured to the disks, substantially as described.

3. The combination with a standard having an axle-spindle, and a shoulder at the base thereof, of a washer-plate non-revolvably secured on the said shoulder, a disk having a central opening clearing the said shoulder and a cap detachably secured to the outer side of the disk, said cap being formed with a recess on its inner side to receive the washer-plate and with a journal-box revolvable on the axle-spindle, the outer end of the said journal-box being closed, substantially as described.

4. A standard having outwardly-extending axle-spindles, shouldered at their bases and provided with lubricant-conducting boxes extending to their outer ends, and means to conduct lubricant to said boxes, in combination with washer-plates non-revolvably secured on said shoulders, disks having central openings clearing said shoulders and caps detachably secured to the outer sides of the disks, said caps being formed with recesses on their inner sides to receive the washer-plates and with journal-boxes revolvable on the axle-spindles, substantially as described.

5. A standard having outwardly-projecting axle-spindles on opposite sides thereof, and formed with shoulders at the base of said axle-spindles, in combination with washer-plates bearing on the said shoulders, bolts extending through the standard and the said washer-plates and having their heads and caps on the outer sides of said washer-plates, said bolts securing the washer-plates on the shoulders of the standard, disks having central openings to clear the shoulders, the said disks engaging the inner sides of said washer-plates, and caps detachably secured to the outer sides of said disks, said caps having journal-boxes revolvable on the axle-spindles, bearing against the shoulders of the standard and having channels or recesses to receive the washer-plates, the sides of the bolt-heads and nuts engaging the sides of said channels, whereby the said caps lock said bolts and nuts, substantially as described.

6. A standard having outwardly-extending axle-spindles, shouldered at their bases, in combination with washer-plates non-revolvably secured on said shoulders, disks having central openings clearing said shoulders, and caps detachably secured on the outer sides of the disks, said caps being formed with recesses on their inner sides to receive the washer-plates and spindle, substantially as described.

7. In a screw-driver, the combination of a standard, a drill-tube, a sleeve supporting the drill-tube, connected to the standard and adjustable longitudinally with respect to its own axis, on the standard, said sleeve displacing the drill-tube on the rear side of the standard and adapting the drill-tube to be disposed at any desired distance therefrom, substantially as described.

8. A standard of the class described having a head with shouldered recesses in its sides, in combination with draw-bars secured to the head,

disposed in said recesses and having shoulders engaging those of the head, substantially as described.

702,599. COLLECTOR-RING FOR ELECTRICAL MACHINES
ROBERT B. BROWN, Pittsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a Corporation of Pennsylvania. Filed Feb. 1, 1902. Serial No. 92,194. (No model.)

Claim.—1. The combination with a rotatable support, of a plurality of collector-rings, arranged side by side and having supporting-arms that project into approximately the same plane and means for fastening the said arms to the support.

2. The combination with a rotatable support, of a plurality of collector-rings, arranged side by side and having supporting-arms that project into approximately the same plane and are provided with cylindrical bosses at their inner ends and bolts extending through said bosses and into the support.

3. The combination with an annular support, of a plurality of collector-rings, arranged side by side and having supporting-arms that project into approximately the same plane, means for insulating the rings from each other and from the support and fastening devices for clamping the rings and insulating means in position.

4. The combination with an annular support, of a plurality of collector-rings, arranged side by side and having supporting-arms that project inwardly into approximately the same plane and alternate with each other on the several rings, and bolts, insulating washers and tubes for attaching the rings to the support and insulating them therefrom and from each other.

5. The combination with an annular support, of a plurality of collector-rings, arranged side by side and having supporting-arms that project inwardly into approximately the same plane and terminate in hollow bosses having beveled inner ends and means for fastening said bosses to the annular support, the latter having beveled surfaces to cooperate with the beveled ends of the bosses.

6. The combination with an annular support, of a plurality of collector-rings each of which is made in two parts and is provided with supporting-arms that project inwardly at such an angle to the plane of the ring as to bring the inner ends of all the arms into substantially the same plane and means for fastening said arms to the support and for insulating the rings from the support and from each other.

7. The combination with an annular support, of a plurality of collector-rings each of which is provided with a plurality of inwardly-projecting arms that terminate in tubular bosses having beveled inner ends, the corresponding ends of all the bosses being in the same plane, and bolts and caps for fastening the bosses to the annular support and insulating washers and tubes interposed between said parts.

8. The combination with an annular support having beveled end surfaces, of a plurality of collector-rings having arms which terminate in tubular bosses provided with beveled inner ends, insulating-washers interposed between the beveled portions of the support and the beveled ends of the bosses and stud-bolts projecting through the bosses and into the annular support.

9. The combination with an annular support having end surfaces that are beveled inward toward each other in pairs, of a plurality of collector-rings each of which has uniformly-spaced arms terminating in hollow bosses having beveled inner ends, insulating washers for separating the bosses from the support, and bolts for fastening the bosses to the support and tubes for insulating the bosses from the stud-bolts.

10. The combination with an annular support adapted to be detachably fastened to an armature-spider, of a plurality of collector-rings arranged side by side and having supporting-arms that project into approximately the same plane and means for fastening the arms independently to said annular support.

11. The combination with an annular support adapted to be detachably fastened to an armature-spider, of a plurality of collector-rings arranged side by side and having supporting-arms that project into approximately the same plane and means for fastening the arms of each

ring independently to the support and for centering the rings with reference to the support and to each other.

702,600. BOOT OR SHOE. FRANK W. SLATER, Montreal, Canada, assignor to George C. Clifford, Brockton, Mass., and George A. Slater and Winthrop Allen Halliagh Slater, Montreal, Canada. Filed May 15, 1902. Serial No. 714,266. (No model.)

Claim.—1. In a leather boot or shoe having a sole, a vamp, a quarter, and a lining for the vamp, secured at its bottom edge by lacing to the sole and at its top edge to said vamp by two rows of stitching, one row (the uppermost) passing through both vamp and lining along the entire top edge of same, and the other row (the undermost) passing through the vamp only for a portion of the length of the lining, a series of ventilating-perforations formed in the vertical portion of the vamp that is situated between the said two rows of stitching, the contents of part of the undermost row of stitching from the lining allowing said perforations to communicate with the air-space formed between the vamp and lining, and a series of perforations in said lining allowing communication between the air-space and the interior of the boot, substantially as described.

2. A leather boot or shoe having a vamp & whose inner and outer surfaces are entirely even and smooth throughout, a lining whose inner and outer surfaces are also entirely even and smooth throughout, said lining having its extreme upper edge only secured to the upper edge only of said vamp by stitching so as to form a single uninterrupted air-chamber *g* between the vamp and lining, a series of perforations *a* in the vertical and slanting upper portion of the vamp immediately beneath the line of stitching *c* that secures the top edge of the lining to the top edge of the vamp, and parallel with each last-mentioned top edge, and a series of apertures *f* in the lining adjacent to its lower edge and extending upward somewhat throughout same, said perforations *a* and apertures *f* communicating with the air-space *g*, for the purpose set forth.

702,601. FLUID-PRESSURE ENGINE. ADOLF C. SMITH, New York, N. Y., assignor to Edward & Jeffery, trustees, Irvington, N. Y. Filed July 24, 1901. Serial No. 69,227. (No model.)

Claim.—1. In a fluid-pressure motor, the combination of a casing, a plurality of cylinders mounted to oscillate in said casing, a main shaft, a crank on the shaft, pistons in the cylinders connected to said crank, a valve-casing cooperating with the outer end of each cylinder, parts in the cylinder end and in each of said valve-casings, two closed passages leading to each valve-casing, all of said passages communicating with a centrally-located chamber, a hollow controlling-valve in said chamber, a plurality of pistons in the face of said valve, a plurality of passages extending through said valve to its hollow center, a nipple mounted in the hollow center of said valve, a packing between said nipple and the valve, and a passage leading from said nipple, substantially as set forth.

2. In a fluid-pressure motor, the combination of a casing, a plurality of cylinders in said casing, a piston in each cylinder, a piston-rod connected to each piston, a main shaft, a crank on the shaft, a wrist-pin on the crank connected with all the pistons, a series of anti-friction-balls supporting the main shaft, two inclined rings forming a track for said balls, a sleeve threaded into the casing for adjusting one of said rings, and a sleeve threaded into said sleeve for adjusting the other of said rings, substantially as set forth.

3. In a fluid-pressure motor, the combination of a casing, a plurality of cylinders in said casing, a piston in each cylinder, a piston-rod connected to each piston, a main shaft, a crank on the shaft, a wrist-pin on the crank connected with all the pistons, a series of anti-friction-balls supporting the main shaft, two inclined rings forming a track for said balls, a sleeve threaded into the casing for adjusting one of said rings, and a sleeve threaded into said sleeve for adjusting the other of said rings, the threads of both of said sleeves being oppositely cut, substantially as set forth.

4. In a fluid-pressure motor, the combination of a casing, a plurality of cylinders in said casing, a piston in each cylinder, a piston-rod connected to each piston, a main shaft, a crank on the shaft, a wrist-pin on the crank connected with all the pistons, a series of anti-friction-balls supporting the main shaft, two inclined rings forming a track for said balls, a sleeve threaded into the casing for adjusting one of said rings, and a packing between the second sleeve and the shaft, substantially as set forth.

5. In a fluid-pressure motor, the combination of a casing, a plurality of cylinders in said casing, a piston in each cylinder, a piston-rod connected to each piston, a main shaft, a crank on the shaft, a wrist-pin on the crank connected with all the pistons, a series of anti-friction-balls supporting the main shaft, two inclined rings forming a track for said balls, a sleeve threaded into the casing for adjusting one of said rings, a sleeve threaded into said sleeve for adjusting the other of said rings, a packing between the second sleeve and the shaft, and a ring engaging the second sleeve for holding said packing in place, substantially as set forth.

6. In a fluid-pressure motor of the class described, the combination of a casing, a cylinder therein mounted in transverse and arranged to oscillate, a yoke straddling the cylinder and connected to each of said transverse, and a pump operated from said yoke, substantially as set forth.

7. In a fluid-pressure motor of the class described, the combination of a casing, a cylinder therein mounted in transverse and arranged to oscillate, a yoke straddling the cylinder and connected at its center to each of said transverse, and two pumps operated from the ends of said yoke, substantially as set forth.

702,602. GORE-SHOOTER. JOHN F. STOWARD, Chicago, Ill. Filed Jan. 6, 1902. Serial No. 65,698. (No model.)

Claim.—1. In combination with a rotary sheet-forming table, a twine-receptacle and a twine-carrying device, said device independent of said sheet-forming table and consisting of a pin provided with means for holding the end of said twine and, when the pin is engaged by the table forming the sheet, carrying the said twine around the said sheet as the latter rotates, substantially as described.

2. In a rotary core-sheeting machine, a twine-receptacle and a pin having the twine-receiving hook *H* and the knife *K*, all combined substantially as described.

702,608. BED-PAN. EMILY A. STOCKDALE, Washington, D.C.
Filed Aug. 8, 1901. Serial No. 71,305. (No model.)

Claim.—1. A bed-pan consisting of a reservoir having an inclined top extending downwardly and forwardly, a cover closing the upper half of the said top, a lid hinged to said cover in such a manner that the same may be folded down on the cover in its open position.

2. A bed-pan consisting of a reservoir having a flat bottom and a substantially cylindrical wall the top edge of said wall extending downwardly and forwardly to form substantially an elliptically-shaped opening, a cover closing the upper half of the said opening, a lid hinged to the lower edge of said cover in such a manner that the same may be folded down on the cover in its open position.

3. A bed-pan consisting of a reservoir having a flat bottom and a substantially cylindrical wall the top edge of the said wall extending downwardly and forwardly to form substantially an elliptically-shaped opening; a cover closing the upper half of the said opening; a lid hinged to the lower edge of the said cover, the said lid being of such a contour that when folded down on the cover its periphery will coincide with that of the cover.

4. A bed-pan consisting of a reservoir having a flat bottom and a substantially cylindrical wall the top edge of the said wall extending downwardly and forwardly to form substantially an elliptically-shaped opening and having its lower half continued outwardly to form a flat flange; a cover closing the upper half of the said opening, a lid hinged to the lower edge of the said cover the said lid being of such a contour that when folded down on the cover its periphery will coincide with that of the cover.

5. A bed-pan consisting of a reservoir having a flat bottom and a substantially cylindrical wall the top edge of said wall extending downwardly and forwardly to form substantially an elliptically-shaped opening and having its lower half continued outwardly to form a flat flange; a cover closing the upper half of the said opening; a lid hinged to the lower edge of the said cover having its outer edge terminating in a catch to take over the flange to fasten the lid in its closed position.

6. A bed-pan consisting of a reservoir having a flat bottom and a substantially cylindrical wall the top edge of said wall extending downwardly and forwardly to form substantially an elliptically-shaped opening and having its lower half continued outwardly to form a flat flange; a cover closing the upper half of the said opening; a lid hinged to the lower edge of the said cover having its outer edge terminating in a catch to take over the flange to fasten the lid in its closed position, the said lid being of such a contour that when folded down on the cover its periphery will coincide with that of the cover.

7. A bed-pan consisting of a reservoir having a flat bottom and a substantially cylindrical wall the top edge of said wall extending downwardly and forwardly to form substantially an elliptically-shaped opening; a cover closing the upper half of said opening; a lid hinged to the lower edge of said cover said lid being of such a contour that when folded down on the cover its periphery will coincide with that of the cover, and handles attached to the outer side of the reservoir.

702,604. ACETYLENE-GAS GENERATOR. DANIEL H. TRENNER, Niagara Falls, N. Y. Filed July 5, 1901. Serial No. 67,072. (No model.)

Claim.—1. In an acetylene-generator, the combination with the base, the generating-chamber arranged above the base, the equalizing-chamber arranged above the generating-chamber and the water-supply tank arranged above the equalizing-chamber, of a conduit connecting the water-tank with the equalizing-chamber and extending from the water-tank downwardly on one side of the generating and equalizing chambers to the base, thence horizontally underneath the base to the opposite side thereof, thence upwardly to the equalizing-chamber on the opposite side of the generating-

chamber, thence downwardly on the same side of the generating-chamber to the base, thence horizontally underneath the base to the first-mentioned side of the base and thence upwardly on the first-mentioned side of the generating-chamber to the equalizing-chamber, substantially as set forth.

2. In an acetylene-generator, the combination with the base and the elevated water-supply tank rigidly connected with the base, of a generating-chamber arranged above the base and detachably connected at its upper end with the water-supply tank, and a clamping device which is arranged wholly above the base and which is connected with the lower end of the generating-chamber, substantially as set forth.

3. In an acetylene-generator, the combination with a base having an annular shoulder on its upper side, and an elevated water-supply tank rigidly connected with the base, of a generating-chamber having its upper end detachably connected with the water-supply tank, and a clamping device which is arranged wholly above the base and which consists of a rotatable ring having a screw connection with the lower end of the generating-chamber and bearing against the upper side of the base around the annular shoulder thereof, substantially as set forth.

4. In an acetylene-generator, the combination with the generating-chamber and the equalizing-chamber of the water-supply tank arranged above the generating-chamber, of a gas-delivery conduit connected with the generating-chamber, a stand-pipe connected at its lower end with the equalizing-chamber and at its upper end with said conduit, and a valve having its inlet opening into the equalizing-chamber and its outlet opening into the generating-chamber, substantially as set forth.

5. In an acetylene-generator, the combination with the generating-chamber and the equalizing-chamber of the water-supply tank arranged above the generating-chamber, of a gas-delivery conduit connected with the generating-chamber, a stand-pipe connected at its lower end with the equalizing-chamber and at its upper end with said conduit, and a valve arranged out of line with said stand-pipe and having its inlet opening into the equalizing-chamber and its outlet opening into the generating-chamber, substantially as set forth.

6. In an acetylene-generator, the combination with the generating-chamber, and the water-supply tank, of a stand-pipe connected at its lower end with the water-supply tank, and a gas-delivery conduit which is connected with the generating-chamber and with the upper end of the stand-pipe and which contains a coil, substantially as set forth.

7. In an acetylene-generator, the combination with the generating-chamber, and the water-supply tank, of a stand-pipe connected at its lower end with the water-supply tank, and a gas-delivery conduit which is connected with the generating-chamber and with the upper end of the stand-pipe and which contains a horizontal coil arranged above said water-supply tank, substantially as set forth.

8. In an acetylene-generator, the combination with the generating-chamber, and the water-supply tank, of a stand-pipe connected at its lower end with the water-supply tank, and a gas-delivery conduit having a horizontal coil which is arranged above said water-supply tank and which has an elevated inlet connected with the generating-chamber and a depressed outlet communicating with the upper end of said stand-pipe, substantially as set forth.

9. In an acetylene-generator, the combination with the generating-chamber, of a purifying-chamber, and a gas-conduit connecting the generating-chamber and the purifying-chamber and provided between its ends with a coil which is arranged outside of the purifying-chamber, substantially as set forth.

10. In an acetylene-generator, the combination with the generating-chamber and the water-supply tank, of a stand-pipe connected at its lower

end with the water-supply tank and with the generating-chamber, a purifying-chamber connected with the upper end of the stand-pipe, and a gas-conduit connecting the generating-chamber and the purifying-chamber and provided between its ends with a coil which is arranged outside of the purifying-chamber, substantially as set forth.

11. In an acetylene-generator, the combination with the generating-chamber and the water-supply tank, of a purifying-chamber having a wide upper part and a contracted lower part, a stand-pipe connected with the water-supply tank and the purifying-chamber, and a gas-delivery conduit connected at its inlet end with the generating-chamber and opening at its outlet end into the contracted part of the purifying-chamber, substantially as set forth.

12. In an acetylene-generator, the combination with the generating-chamber and the water-supply tank, of a purifying-chamber, a stand-pipe connected with the water-supply tank and the purifying-chamber, and a gas-delivery conduit having its inlet end connected with the generating-chamber and its outlet end extending into the lower part of the purifying-chamber and provided with slots, substantially as set forth.

13. In an acetylene-generator, the combination with the generating-chamber, and the water-supply tank, of a purifying-chamber, a stand-pipe connected with the water-supply tank and the purifying-chamber, a gas-delivery conduit having its inlet end connected with the generating-chamber and having its outlet end projecting downwardly into the lower portion of the purifying-chamber, and a deflecting-plate arranged on said outlet within the purifying-chamber, substantially as set forth.

14. In an acetylene-generator, the combination with the generating-chamber and the water-supply tank, of a purifying-chamber, a stand-pipe connected with the water-supply tank and the purifying-chamber, a gas-delivery conduit having its inlet end connected with the generating-chamber and having its outlet end projecting downwardly into the lower portion of the purifying-chamber, and a screen having a fixed section which is secured within the purifying-chamber around said outlet end and a removable section which fits into the fixed section, substantially as set forth.

15. In an acetylene-generator, the combination with the generating-chamber, and the water-supply tank, of a purifying-chamber having an opening in its top which is closed by a cover, a stand-pipe connected with the water-supply tank and the purifying-chamber, a gas-delivery conduit having its inlet end connected with the generating-chamber and having its outlet end projecting downwardly into the lower part of the purifying-chamber, a deflecting-plate arranged on the gas-delivery conduit above the outlet thereof, and a screen arranged in the purifying-chamber above the deflecting-plate and consisting of a fixed section and a removable section constructed to pass through the opening in the top of the purifying-chamber, substantially as set forth.

16. In an acetylene-generator, the combination with the generating-chamber, the water-supply tank and the purifying-chamber, of a gas-delivery conduit connecting the generating-chamber and the purifying-chamber, a stand-pipe connected at its lower end with the water-supply tank, and a burner-pipe having a branch which opens into the purifying-chamber and a branch which connects with the upper end of the stand-pipe, substantially as set forth.

17. In an acetylene-generator, the combination with the generating-chamber, the water-supply tank and the purifying-chamber, of a gas-delivery conduit connecting the generating-chamber and the purifying-chamber, a stand-pipe connected at its lower end with the water-supply tank, and a burner-pipe having a branch which connects with the upper end of the stand-pipe and a branch which extends into the central part of the purifying-chamber, substantially as set forth.

18. In an acetylene-generator, the combination with the generating-chamber, the water-supply tank and the purifying-chamber, of a gas-delivery conduit connecting the generating-chamber and the purifying-chamber, a stand-pipe connected at its lower end with the water-supply tank, a burner-pipe having a branch which connects with the upper end of the stand-pipe and a branch which opens into the purifying-chamber, and a perforated nipple arranged in said last-mentioned branch of the burner-pipe, substantially as set forth.

19. In an acetylene-generator, the combination with the generating-chamber, the water-supply tank and the purifying-chamber, of a gas-delivery conduit connecting the generating-chamber and the purifying-chamber, a stand-pipe connected at its lower end with the water-supply tank, a burner-pipe having a branch which connects with the upper end of the stand-pipe and a branch which opens into the purifying-chamber, a perforated nipple removably arranged in said last-mentioned branch of the burner-pipe, and a cover which closes an opening in the top of the purifying-chamber, substantially as set forth.

702,605. HARP-FASTENER. ASHLEY VANDER, New Britain, Conn., assignor to the Stanley Works, New Britain, Conn., a Corporation of Connecticut. Filed Mar. 6, 1902. Serial No. 68,660. (No model.)

Claim.—1. A staple-carrier comprising a metallic plate having a slotted offset portion; a staple the legs of which pass through the slots of said offset portion; and a plate fitted in the recess formed by the offset portion on the back of the staple-carrier and to which plate the legs of the staple are secured, said plate being of less width than said recess, and being adapted to bear against the support to which the staple-carrier is secured.

2. A staple-carrier consisting of a sheet-metal plate with a stamped-up offset portion, said offset portion having a pair of slots; a staple, the legs of which are inserted through said slots; and a plate to which the legs of the staple are secured, said plate being of less width than the recess formed by the offset portion in the staple-carrier.

3. The combination, with a harp having a slot, of a staple-carrier having an offset portion provided with a pair of separated slots; a staple, the legs of which are inserted in said slots; and a plate to which the legs of said staple are secured, said plate fitting in the recess formed by the offset portion on the back of the staple-carrier and being of less width than said recess.

702,606. FRAME OR BASE FOR ZINC OR ELECTROTYPE PLATES. STEPHEN WATERMAN, Providence, R. I. Filed Mar. 2, 1901. Serial No. 60,333. (No model.)

Claim.—1. An enclosing frame-like base or support of yielding material for zinc, electrotype or similar plates having recesses filled with a yielding material.

2. An enclosing frame-like base or support of unyielding material for zinc, electrotype or similar plates having holes filled with a yielding material and an elongated recess filled with a similar substance.

3. An enclosing frame-like base or support of unyielding material for zinc, electrotype or similar plates having a series of holes and an elongated undercut recess filled with a yielding material.

4. A rigid frame-like base or support adapted to inclose type and having a series of holes and an elongated undercut recess filled with a yielding material, and a border-plate and an independent cut or cut detachably secured to said base by nails driven into said yielding material.

5. A rigid frame-like base or support adapted to inclose type and having a series of holes filled with a yielding material and a border-plate detachably secured to said base by nails driven into said yielding material.

702,607. REVOLVING FIREARM. JOSEPH H. WILSON, Springfield, Mass. Filed Jan. 2, 1902. Serial No. 53,154. (No model.)

Claim.—1. In a revolver having a side-swiveling cylinder, a cylinder-yoke, and a locking device between the yoke and the frame in front of the cylinder; a locking device between the rear end of the cylinder and the frame, and a device located in the frame between the yoke-lock and the cylinder-lock, and operatively connected with each, whereby both of said locks may be simultaneously operated.

2. In a revolver having a side-swiveling cylinder, a cylinder-yoke,

and a locking device between the frame and said yoke in front of the cylinder; a locking device between the rear end of the cylinder and the frame; connecting members extending through the axis of the cylinder-yoke between said two locking devices, whereby they may be coindently operated.

3. In a revolver having a side-owing cylinder, a cylinder-yoke, and a locking device between said yoke and the frame coinguous thereto, consisting of an L-shaped locking-bolt, one arm of which is parallel with the yoke and the other arm of which extends through the axis of the yoke; an offset member on the arm of said bolt in the yoke extending across the meeting line of the frame and yoke and adapted to engage the former; a locking device for the rear end of the cylinder, and connecting means between the yoke-lock and the cylinder-lock, whereby the operation of both may be simultaneously effected.

702,608. WELL-BORING MACHINE. FRANK J. WOOD, San Antonio, Tex. Filed Oct. 4, 1901. Serial No. 71,574. (No model.)

Claim.—1. In a well-boring machine, the combination of the revolvable pipe or drill-rod clutch mounted in horizontal bearings having biting-surfaces milled into a series of curvilinear grooves or depressions for the purpose specified.

2. A clutch for operating a drill-rod or pipe of a well-boring machine comprising two or more revolvable members having their biting-surfaces milled in oblique grooves or depressions which intersect the grain of said pipe or rod.

3. In a well-boring machine, the combination of a revolvable head having cogs thereon meshing with a driving-pinion, of a series of idler-pinions meshing with said cogs which together with the driving-pinion support said head and which are interchangeable with the driving-pinion in drive said head.

4. The combination of the rotary head having shrouded beveled cogs, a driving-pinion having shrouded beveled cogs meshing with the cogs of the head, a series of idler-pinions having shrouded beveled cogs meshing with the cogs of the head each interchangeable with the driving-pinion to drive the head the shrouding of the cogs of the head and those of the pinions being arranged on the pitch-line whereby an antifrictional support is formed for the head and it is held against lateral play.

702,609. MECHANICAL WARP STOP-MOTION FOR LOOM. HERMAN WYMAN, Worcester, Mass., assignor to Crumpton & Knowles Loom Works, Worcester, Mass., a Corporation of Massachusetts. Filed Dec. 12, 1901. Serial No. 85,929. (No model.)

Claim.—1. In a loom, the combination of a loom-thread-supporting beam and loom-needles, a series of drop devices supported by the loom-threads between the loom-beam and needles, means interposed between the drop devices and loom-needles for maintaining a normal condition and preventing deflection of the loom-threads as they pass through the drop devices, and means operative on the dropping of a drop device to stop the loom.

2. In a loom, the combination of a loom-thread-supporting beam and loom-needles, a series of drop devices supported by the loom-threads between the loom-beam and needles, guiding means and tension devices for the loom-threads interposed between the drop devices and loom-needles for maintaining a normal condition of the loom-threads as they pass through the drop devices and means operative on the dropping of a drop device to stop the loom.

3. In a loom, the combination of a loom-thread-supporting beam and loom-needles, a series of drop devices supported by the loom-threads between the loom-beam and needles, guide-rod and tension devices for the loom-threads interposed between the drop devices and loom-needles for maintaining a normal condition of the loom-threads as they pass through the drop devices, said drop devices, guide-rod and tension devices being disposed above the plane of the warp-threads and mechanical devices operative on the dropping of a drop device to stop the loom.

4. In a loom, the combination of a loom-thread-beam and loom-needles, drop devices normally supported by the loom-threads between the beam and loom-needles, means disposed between the loom-threads and drop devices for maintaining a normal condition of the loom-threads as they pass through the drop devices, a guide-rod for the drop devices and a mechanical stop-motion comprising a transverse bar extending below the drop devices, a movable slider rod or bar extending below said transverse bar and coacting mechanism intermediate said bar and the stop-motion to move the stop-motion and stop the loom on the dropping of a drop device.

5. In a loom, the combination with the loom-beam and loom-needles, supporting-rod for the loom-threads disposed between the loom-beam and loom-needles, a series of drop wires or bars hung upon the loom-threads between said supporting-rod and extending in a plane above the ordinary warp-threads, a guide rod or bar for the drop wires or bars, and a mechanical stop-motion comprising two transverse inclined bars having a space between them and disposed between the loom-beam and loom-needles, a movable slider rod or bar extending below the said inclined bars and coacting mechanism to move the stop-motion and stop the loom on the breaking of a loom-thread.

702,610. KNITTING-FASTENER. EDWARD A. ASHMAN, New York, N. Y. Filed Feb. 24, 1902. Serial No. 85,297. (No model.)

Claim.—A made-up necktie comprising a shield *a* having a central longitudinal slot and a downwardly-directed central portion, the body portion of the tie consisting of a strip of suitable material, one end of which is passed through the slot in the shield from the back to the front thereof and folded back over the top edge thereof and downwardly and the two ends of which form the bottom portion of the tie and a supplemental piece secured to the back of the tie below the slot in the shield and folded over around and secured to form the head of the tie, the downwardly-directed portion of said shield being secured to the back of the head, substantially as shown and described.

702,611. MANUFACTURE OF ARTIFICIAL STONE OR BRICK AND THE PREPARATION OF LIME THEREFOR. OSCAR E. ANDERSON, Stockholm, Sweden, assignor, by mesne assignments, to Illinois Brick Syndicate, Montreal, Canada, a Corporation of Delaware. Filed Dec. 4, 1901. Serial No. 94,089. (No specimen.)

Claim.—1. The process of simultaneously making brick or other articles out of lime and sand and slaking lime, the same consisting in mixing the sand and lime with the minimum amount of moisture necessary to hold the mixture in form, next molding the mixture into the desired shape, including the molded articles in a chamber together with a separate quantity of unslaked lime, and finally hardening the bricks, and slaking the lime by the application of high-pressure steam only, substantially as described.

2. The process of simultaneously making brick or other articles out of lime and sand and slaking lime, the same consisting in mixing the sand and dry-slaked lime in substantially the proportions specified, maintaining the mixture with the minimum amount of moisture necessary to hold it in form, next molding the mixture, including the molded articles in a chamber together with a quantity of unslaked lime approximately equal to that contained in the batch of articles to be hardened, and finally hardening the bricks and slaking the lime by the application of high-pressure steam only, the chamber being free from excessive humidity throughout the operation, substantially as described.

3. The process of making brick or other articles out of lime and sand, the same consisting in mixing substantially sixty-five parts by weight of silicious sand with five parts by weight of dry and finely-divided lime and with the minimum amount of moisture necessary to hold the mixture in form, next molding the mixture into the desired shape, including the molded articles in a chamber, together with a quantity of unslaked lime approximately equal to that contained in the batch of articles to be hardened, and finally hardening the mixture and slaking the lime by the application of dry steam only at a pressure of not less than one hundred pounds to the square inch, the chamber being free from excessive humidity throughout the operation, substantially as described.

4. In the manufacture of silicious stone or bricks and the preparation of lime required therefor, first mixing a quantity of sand with a mixture, previously heated to redness, of sand and slaked lime, maintaining the mass with diluted hydrochloric acid, pressing same into brick form, placing the bricks in a chamber and also placing in the same chamber, but separate from said bricks, a quantity of lime to be slaked, closing said chamber and introducing thereinto high-pressure steam, whereby vaporized moisture will be derived from said bricks and caused to thoroughly permeate the separate quantity of lime to be slaked, as set forth.

702,612. COMBINED AXLE-NUT AND OIL-CAP FOR WHEELS. ARTHUR C. AYER, Amherst, New Zealand. Filed July 29, 1901. Serial No. 79,125. (No model.)

Claim.—In a lubricating-axle, an axle-arm having a bore forming a feed-passage for the lubricant, said passage extending from the outer end of said arm downwardly at an inclination and terminating at its lower end in a groove on the under side of the said arm, said passage having its

outer end arranged essentially with respect to the center of the axle-arm, an integral axle-nut and an oil-cap, said oil-cap forming a reservoir for the lubricant, said axle-nut adapted to be mounted upon the axle-arm so that the latter with the outer end of the feed-passage will extend through the nut and into the reservoir without engaging the walls of the latter, a washer interposed between the nut and arm, there being a flange integral with the nut and cap surrounding and engaging the washer to prevent the former from rotating, substantially as herein shown and described.

702,613. ENGAGEMENT MECHANISM FOR TYPE-WRITERS. WILLIAM G. BARBER, Brooklyn, N. Y.; Bertha G. Barber, administratrix of said William G. Barber, deceased. Filed Aug. 24, 1901. Serial No. 73,511. (No model.)

Claim.—1. In a type-writer component the combination of an engagement-wheel formed with retractable and protrudible pawl-teeth, a stationary dog protruding into the path of said pawl-teeth, and a movable dog arranged to force the pawl-teeth successively out of engagement with said stationary dog together with means for actuating said movable dog through the medium of the key mechanism.

2. In a type-writer component the combination of an engagement-wheel formed with retractable and protrudible pawl-teeth, a stationary dog protruding into the path of said pawl-teeth, and a movable dog arranged to force the pawl-teeth successively out of engagement with said stationary dog and to engage the next succeeding pawl-teeth temporarily, together with means for actuating said movable dog through the medium of the type-writer key mechanism, substantially as set forth.

3. In a type-writer component the combination of an engagement-wheel having retractable pawl-teeth, means for returning said pawl-teeth to their normal position automatically, a stationary dog protruding into the path of said pawl-teeth, and a movable dog arranged to force the pawl-teeth successively out of engagement with said stationary dog and to engage the next succeeding pawl-teeth temporarily, together with means for actuating said movable dog through the medium of the type-writer key mechanism, substantially as set forth.

4. In a type-writer component the combination of the engagement-wheel *E*, formed with the retractable and protrudible pawl-teeth *a, c*, the stationary dog *r*, the movable dog *m*, and means for actuating said movable dog through the medium of the key mechanism of a type-writing machine, substantially as set forth.

5. In a type-writer component the combination of the engagement-wheel *E*, formed with the retractable and protrudible pawl-teeth *a, c*, the stationary dog *r*, the movable dog *m*, formed with the tripping-rod *w*, and with the detaining-shoulder *u*, and means for actuating said movable dog through the medium of the key mechanism of a type-writing machine, substantially as set forth.

6. In a type-writer component the combination with the carriage-track *F*, pinion *f*, and shaft *a*, of the engagement-wheel *E*, mounted on said shaft, and formed with the retractable and protrudible pawl-teeth *a, c*, the stationary dog *r*, projecting into the path of said pawl-teeth the movable tripping-dog *m*, and means for actuating said movable dog through the medium of the key mechanism of a type-writing machine.

7. In a type-writer component the combination of an engagement-wheel, formed with the retractable pawl-teeth on said engagement-wheel, a rigid stationary dog projecting into the path of said pawl-teeth when in their normal position, and means for releasing said pawl-teeth successively from engagement with said stationary dog through the medium of the key mechanism of a type-writing machine, substantially as set forth.

8. In a type-writer component the combination of an engagement-wheel, formed with the retractable pawl-teeth on said engagement-wheel, a rigid stationary dog projecting into the path of said pawl-teeth when in their normal position, a movable dog formed with a tripping-rod for releasing a preceding pawl-teeth from the said stationary dog and with a retaining-shoulder for holding the next succeeding pawl-teeth temporarily and means for actuating said movable dog through the medium of the key mechanism of a type-writing machine, substantially as set forth.

9. In a type-writer attachment, the combination of an escapement-wheel, formed with the retractable and protrudible spring-pawls pivotally connected to said escapement-wheel, a rigid stationary dog projecting in the path of said spring-pawl teeth when protruded, a movable dog formed with a tripping-toe for releasing said spring-pawl teeth from said stationary dog, and means for actuating said movable dog by the key mechanism of a type-writing machine, substantially as set forth.

702,614. SHEET FOR ROOF-COVERING. WILLIAM H. RAGAN, Southbrook, N. J. Filed Jan. 20, 1902. Serial No. 90,542. (No model.)

Claim.—1. A sheet for roof-covering having a row of perforations and folded on itself, the fold extending through the perforations.

2. A sheet for roof-covering having a plurality of rows of perforations and folded on itself and the folds extending through the perforations and having another fold situated between the other folds.

3. A sheet for roof-covering having a perforation and folded on itself the fold extending through the perforation.

4. A sheet for roof-covering having a row of perforations and a fold and the fold extending through the perforations and being in turn folded on itself thereby forming a plurality of thicknesses.

5. A sheet for roof-covering composed of felt and having a plurality of perforations and folded on itself and the fold-line extending through the perforations.

6. A sheet for roof-covering having a plurality of rows of perforations, and the perforations of the respective rows being out of transverse alignment with each other.

702,615. FUELLE. GEORGE F. BARBER, Springfield, Mass. Filed Jan. 31, 1902. Serial No. 91,961. (No model.)

Claim.—1. A puzzle comprising a suitable support and a plurality of blocks adapted to be superposed and strung on said support and provided on their edges with sections of a picture or the like which is completed when said blocks are superposed in proper sequence, said blocks and support being so formed that when the blocks are strung on said support they are held thereby against turning, substantially as described.

2. A puzzle comprising a suitable support and a plurality of blocks adapted to be superposed and strung on said support and provided on their edges with sections of a picture or the like which is completed when said blocks are superposed in proper sequence, said blocks being provided with openings inside their edges for the passage of the support, the said openings and support being so formed that the blocks when strung on said support are held against turning, substantially as described.

3. A puzzle comprising a suitable support and a plurality of blocks adapted to be superposed and strung on said support and provided on their edges with sections of a picture or the like which is completed when said blocks are superposed in proper sequence and alignment, said support being so formed as to permit the blocks to be strung thereon in proper alignment and also out of proper alignment and in either of said positions of the blocks to prevent turning thereof, substantially as described.

4. A puzzle comprising a suitable support and a plurality of blocks adapted to be superposed and strung on said support and provided on their edges with sections of a picture or the like which is completed when said blocks are superposed in proper sequence and proper alignment, said blocks being each provided with a plurality of openings inside their edges for the passage of the support, said openings and support being so formed

as to permit the blocks to be strung on the support in proper alignment and also out of proper alignment and to prevent turning of the blocks on the support in either of said positions, substantially as described.

5. A puzzle comprising a plurality of rods connected together and a plurality of blocks each provided with a like number of openings adapting them to be superposed on said support and provided on their edges with sections of a picture or the like which is completed when said blocks are superposed in proper sequence and alignment, said rods and openings being so disposed as to permit the blocks to be strung on said rods in proper alignment and also out of proper alignment and in either of said positions of the blocks to prevent turning thereof, substantially as described.

6. A puzzle comprising a plurality of rods B and a plurality of blocks A provided on their edges with sections of a picture or the like which is completed when said blocks are superposed in proper sequence and alignment, said blocks being provided with openings B' equal in number and corresponding in position to the rods B, said rods being of such length as to each pass through the several blocks, substantially as described.

702,616. FLOOR CONSTRUCTION. WILLIAM H. BARBER, Boston, Mass. Filed Apr. 4, 1902. Serial No. 94,945. (No model.)

Claim.—1. In a floor construction the combination of I-beams; sets of plates forming an arch with a flat top, the I-beams forming the abutments of the arch and the middle plates of the sets forming the keystones, the end plates each having a horizontal web and a vertical web, with rib connections between the webs; and lower plates supporting the ends of the arch, and each extending from I-beam to I-beam and supported by the I-beams.

2. In a floor construction the combination of I-beams; sets of plates forming an arch with a flat top, the I-beams forming the abutments of the arch and the middle plates of the sets forming the keystones, the end plates each having a horizontal web and a vertical web, with rib connections between the webs; and lower plates supporting the ends of the arch, and each extending from I-beam to I-beam and supported by the I-beams, each lower plate being ribbed upwardly, substantially as shown.

702,617. DUMPING-WAGON. MARTIN BREKER, Albany, N. Y. Filed Mar. 22, 1902. Serial No. 100,412. (No model.)

Claim.—1. In a dumping-wagon, the combination with a forward head-block and rear axle-block, of a central longitudinal supporting-bar secured to said head-block and axle-block, a wagon-box having a bottom consisting of two leaves hinged at their inner edges to said central longitudinal bar and extending between said head-block and axle-block, rock-shafts provided with lifting-arms adapted to bear against the outer edges of said leaves, operating-levers secured to said rock-shafts, rock-shafts secured to the outer sides of said box and provided with hand-levers and latches adapted to engage the outer edges of said leaves, substantially as shown and described.

2. In a dumping-wagon, the combination with a forward head-block and rear axle-block, of a central longitudinal supporting-bar secured to said head-block and axle-block, a wagon-box having a bottom composed of leaves hinged at their inner edges to said central longitudinal supporting-bar, and extending between said head-block and axle-block, rock-shafts secured to said head-block and axle-block and provided with lifting-arms adapted to bear against the outer edges of said leaves, operating-levers secured to said rock-shafts, rock-shafts secured to the outer sides of said box and provided with latches adapted to engage the outer edges of said leaves, hand-levers secured to said rock-shafts, and a central longitudinal dividing-plate arranged over the lower edges of said leaves and provided with inclined sides converging toward a central upper edge, substantially as shown and described.

702,618. TOP-ROLL SADDLE. JOHN BLANCKSON, Bristol, R. I. assigner, by mesne assignments, to Mary M. Blumhough, Bristol, R. I. Filed Jan. 31, 1902. Serial No. 92,047. (No model.)

Claim.—1. A keeper for stirrups of top-roll saddles, the same comprising a plate placed against the saddle and secured thereto with provisions for a sliding longitudinal adjustment thereon, said plate having shoulders between which the stirrup engages, substantially as described.

2. The combination with a top-roll saddle topped in its body portion with a screw-threaded hole; of a stirrup-keeper comprising a plate having a longitudinal slot registering with the said hole, and shoulders between which the stirrup engages; together with a screw entered through the slot and engaging the hole to secure the keeper at different adjustments.

702,619. GARMENT-HANGER. JULIUS BLACK, Toledo, Ohio, assigner to the Elmhurst Manufacturing Company, Durkay, Mich. Filed Nov. 18, 1901. Serial No. 92,730. (No model.)

Claim.—1. In a garment-hanger, the combination of a supporting-rod A formed into a hook at its upper end; arms B, B, curved upwardly and inwardly at their outer ends, pivotally secured to said support A; springs C pivotally secured to said arms and embracing said support, as specified.

2. In a garment-hanger, the combination of a central support; distending-arms pivotally secured thereto; and extending upwardly; and a spring U secured to said arms and embracing said support, whereby said arms are normally held upwardly, as specified.

702,620. CHAPLET FOR SUPPORTING CORNS IN MOLD. WILLIAM A. BULL, Pittsburgh, Pa. assigner to the Westinghouse Machine Company, a Corporation of Pennsylvania. Filed Oct. 10, 1900. Serial No. 22,901. (No model.)

Claim.—1. A chaplet for supporting and supporting corns in mold, comprising a stem and two heads which have outer faces of relatively large area and are adjustably mounted upon the ends of the stem.

2. A chaplet for supporting and supporting corns in mold, comprising a screw-threaded stem and two internally-screw-threaded heads which have outer faces of relatively large area and are mounted upon the ends of the stem.

702,621. TYPE-DISTRIBUTING APPARATUS. JAMES DRAKE, Brooklyn, N. Y. Filed Oct. 21, 1901. Serial No. 92,712. (No model.)

Claim.—1. In a device for forwarding lines of type, the combination of the vertical type-channel V, the abutment B, the reciprocating line-forwarder L, the rotatable wheel P, the driving-worm W, the cam K, the rocker R, the link S, and means for temporarily supporting a line of type while it is being forwarded into the said vertical type-channel V, substantially in the manner and for the purpose set forth.

2. In a device for forwarding lines of type, the combination of the vertical type-channel V, the abutment B, the reciprocating line-forwarder L, the rotatable wheel P, the driving-worm W, the cam K, the rocker R, the link S, the peripheral cam C, formed with the type-support A, the whole arranged and operating substantially in the manner and for the purpose described.

3. In a device for forwarding lines of type, the combination of the vertical type-channel V, the abutment B, the reciprocating line-forwarder L, the rotatable wheel P, the driving-worm W, the cam K, the rocker R, the link S, the peripheral cam C, formed with the grooves a, a', the lever D, and the spring-plunger H, formed with the type-support A, the whole arranged and operating substantially in the manner set forth.

702,622. ELECTRIC TELEGRAPHY. SIDNEY G. BROWN, Putney, England. Original application filed Nov. 8, 1900. Serial No. 33,541. Divided and this application filed June 15, 1901. Serial No. 64,733. (No model.)

Claim.—4. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-antennae, automatic transmitting

instruments adapted to control said batteries so as to send signals out of phase or which "overlap," means for receiving said signals, means for neutralizing the effect of the last part of each signal upon the said receiving means so that each signal shall be free from any overlapping effect from its preceding signal, and means for recording said signals, substantially as described.

2. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, two pairs of signaling-levers adapted to control said batteries in series with one another, a pair of rocking arms interposed between the signaling-levers, a pair of signaling-needles, pivoted cranked levers having their ends at one extremity connected to said signaling-needles, blocks depending from the ends of the rocking arms, sliding rods adapted to be moved by said depending blocks so as to operate the signaling-levers for closing the battery-circuits, means for returning said levers so as to open the battery-circuits after being thus operated, means for receiving the signals, means for neutralizing the effect of the last part of each signal upon the said receiving means so that each signal shall be free from any overlapping effect from the preceding signal, and means for recording said signals, substantially as described.

3. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, automatic transmitting instruments adapted to control said batteries so as to send signals which are out of phase or which "overlap," a receiving-condenser, a receiving-relay operated by said signals, means operated by the receiving-relay for neutralizing the effect of the last part of every received signaling-current on the coil of said relay, means also operated by said receiving-relay for overcoming the effect on said relay-coil caused by the charging up of the receiving-condenser by a series of signals of the same sign, and means for recording the signals, substantially as described.

4. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, transmitting instruments adapted to control said batteries so as to send signals which are out of phase or "overlap," a receiving-relay operated by said signals, secondary relays operated by the receiving-relay, recording instruments operated by the secondary relays and adapted to respectively record the positive and negative signals received, an electromagnet in the circuit of each recording instrument, a divided battery, an armature operated by said electromagnets for closing the circuit of one or other half of the divided battery when signals are recorded, and means included in the circuit of said divided battery for neutralizing the effect of the last part of every received signaling-current on the coil of the receiving-relay so that each signal shall be free from any overlapping effect from the preceding signal, substantially as described.

5. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, transmitting instruments adapted to control said batteries so as to send signals which are out of phase or "overlap," a receiving-condenser, a receiving-relay operated by said signals, secondary relays operated by the receiving-relay, means operated by said secondary relays for sending a current through the coil of said receiving-relay to overcome the effect caused by the charging up of the receiving-condenser by a series of signals of the same sign, recording instruments operated by the secondary relays and adapted to respectively record the positive and negative signals received, an electromagnet in the circuit of each recording instrument, a divided battery, an armature operated by said electromagnets for closing the circuit of one or other half of the divided battery when signals are recorded, and means for neutralizing the effect of the last part of every received signaling-current on the coil of the receiving-relay so that each signal shall be free from any overlapping effect from the preceding signal, substantially as described.

6. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, transmitting instruments adapted to control said batteries so as to send signals which are out of phase or which "overlap," a receiving-relay operated by said signals, recording instruments for recording said signals, a pair of rotatable shafts, sweepers carried by said shafts, sectional ring-contacts over which said sweepers are adapted to sweep, batteries in the sweepers-circuits, a winding on the coil of the receiving-relay included in the sweepers-circuits, means connected to the sections of the ring-contacts and included in the sweepers-circuits for affecting the currents sent through the sweepers-circuits so as to neutralize the last part of every signal on the coil of the receiving-relay, radial pins carried by said rotatable shafts, armatures adapted to normally engage said radial pins, electromagnets in the circuit of the said divided battery for operating said armatures so as to release one or other of the rotatable shafts when a signal is received, a contact-maker in the circuit of said divided battery, means operated by one of the rotatable shafts for actuating said contact-maker so as to close the circuit of that electromagnet in the divided battery-circuit which controls the armature engaging the radial pin on one of the rotatable shafts, until the other of said rotatable shafts has completed a revolution, a split battery included in each of the sweepers-circuits, a winding on the coil of the receiving-relay included in the sweepers-circuits, and relay instruments included in the circuit of the first-mentioned divided battery and adapted to close the circuits of the split batteries in the sweepers-circuits, substantially as described for the purpose specified.

7. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, transmitting instruments adapted to control said batteries so as to send signals out of phase or which "overlap," a receiving-relay operated by said signals, secondary relays op-

erated by the receiving-relay, recording instruments operated by the secondary relays and adapted to respectively record the positive and negative signals received, a pair of rotatable shafts, sweepers carried by said shafts, sectional ring-contacts over which said sweepers are adapted to sweep, batteries in the sweepers-circuits, a winding on the coil of the receiving-relay included in the sweepers-circuits, means connected to the sections of the ring-contacts and included in the sweepers-circuits for affecting the currents sent through the sweepers-circuits so as to neutralize the effect of the last part of every signal on the coil of the receiving-relay, means for normally holding the rotatable shafts stationary, electrical means operated by the secondary relays for releasing one of the rotatable shafts and closing the circuit of its sweepers-battery when a signal is received, and means operated by the rotatable shafts whereby the circuit of the means for releasing one rotatable shaft is closed while the other rotatable shaft is completing its revolution, substantially as described for the purpose specified.

8. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, a pair of transmitting instruments adapted to control said batteries so as to send signals which are out of phase or which "overlap," a receiving-relay operated by said signals, secondary relays operated by the receiving-relay, recording instruments operated by the secondary relays and adapted to respectively record the positive and negative signals received, an electromagnet in the circuit of each recording instrument, a divided battery, an armature operated by said electromagnets so as to close the circuit of one or other half of said divided battery when signals are recorded, a pair of rotatable shafts, sweepers carried by said shafts, sectional ring-contacts over which said sweepers are adapted to sweep, means connected to the sections of the ring-contacts and included in the sweepers-circuits for affecting the currents sent through the sweepers-circuits so as to neutralize the last part of every signal on the coil of the receiving-relay, radial pins carried by said rotatable shafts, armatures adapted to normally engage said radial pins, electromagnets in the circuit of the said divided battery for operating said armatures so as to release one or other of the rotatable shafts when a signal is received, a contact-maker in the circuit of said divided battery, means operated by one of the rotatable shafts for actuating said contact-maker so as to close the circuit of that electromagnet in the divided battery-circuit which controls the armature engaging the radial pin on one of the rotatable shafts, until the other of said rotatable shafts has completed a revolution, a split battery included in each of the sweepers-circuits, a winding on the coil of the receiving-relay included in the sweepers-circuits, and relay instruments included in the circuit of the first-mentioned divided battery and adapted to close the circuits of the split batteries in the sweepers-circuits, substantially as described.

9. In a system of electric telegraphy, the combination with the line or cable, of a pair of transmitting-batteries, a pair of transmitting instruments adapted to control said batteries so as to send signals which are out of phase or which "overlap," a receiving-condenser, a receiving-relay operated by said signals, secondary relays operated by the receiving-relay, means operated by said secondary relays for sending a current through the coil of the said receiving-relay to overcome the effect caused by the charging up of the receiving-condenser by a series of signals of the same sign, recording instruments operated by the secondary relays and adapted to respectively record the positive and negative signals received, an electromagnet in the circuit of each recording instrument, a divided battery, an armature operated by said electromagnets so as to close the circuit of one or other half of said divided battery when signals are recorded, a pair of rotatable shafts, sweepers carried by said shafts, sectional ring-contacts over which said sweepers are adapted to sweep, means connected to the sections of the ring-contacts and included in the sweepers-circuits for affecting the currents sent through the sweepers-circuits so as to neutralize the last part of every signal on the coil of the receiving-relay, radial pins carried by said rotatable shafts, armatures adapted to normally engage said radial pins, electromagnets in the circuit of the said divided battery for operating said armatures so as to release one or other of the rotatable shafts when a signal is received, a contact-maker in the circuit of said divided battery, means operated by one of the rotatable shafts for actuating said contact-maker so as to close the circuit of that electromagnet in the divided battery-circuit which controls the armature engaging the radial pin on one of the rotatable shafts, until the other of said rotatable shafts has completed a revolution, a split battery included in each of the sweepers-circuits, a winding on the coil of the receiving-relay included in the sweepers-circuits, and relay instruments included in the circuit of the first-mentioned divided battery and adapted to close the circuits of the split batteries in the sweepers-circuits, substantially as described for the purpose specified.

702,828. FURNITURE-COUPLES. JAMES BROWNE and HIRAN J. ROY, Shelbyville, Ind. Filed Mar. 12, 1902. Serial No. 95,017. (No Model.)

Claim.—1. A coupling for joints of furniture, comprising a brace-bar, a wedge which engages the brace-bar and is maintained at substantially right angles thereto, each wedge having a slot therethrough, and openings through the end portions of the brace-bar, for the purpose set forth.

2. A coupling for joints of furniture consisting of a brace-bar, a slotted wedge connected to the brace-bar to project at right angles therewith, a bolt carried by one of the parts which it is desired to connect, an opening for the passage of the bolt and a means in a part which is to be connected to the first-mentioned part, the wedge engaging the means to frictionally engage the part and the head of the bolt, the brace-bar overlying both of the connected parts, substantially as shown.

3. In a coupling and brace for furniture, a wedge which frictionally engages one part and a headed bolt attached to another part, a bar which overlies the connected parts and to which the wedge is attached, and means for holding the bar against the connected parts, substantially as shown.

4. As an article of manufacture, a furniture fastening or coupling consisting of a bar having apertures adjacent to its ends, a wedge having a keyhole-slot therethrough, each wedge being maintained at substantially right angles with the bar, for the purpose set forth.

5. As an improvement in fastening device of the class described, the combination with the furniture body member having an aperture, of a detachable part which runs upon the body member and over the aperture, said detachable part having an adjustable screw-bolt the head of which is passed through the aperture in the body member to position the head beyond the aperture through each part, a wedge which exerts a clamping action upon the head of the bolt and upon the part of the body member adjacent to the aperture, and a brace-bar which overlies the connected parts to hold them in engagement and to hold the wedge against displacement, the brace-bar being positively connected to the parts which are clamped by the bolt and wedge, substantially as shown.

6. As an improvement in fastening device of the class described, the combination with the furniture body member having an aperture therethrough, of a detachable vertical back piece the lower edge of which runs upon the body member, a screw-bolt which projects from the lower end of the detachable back piece so that its head will be beyond the aperture, a wedge which spans the stem of the bolt and engages the head and the body member adjacent to the aperture through said body member, and a brace-bar which is connected to the wedge and is also connected to the parts which are clamped to each other by the bolt and wedge, substantially as shown.

702,824. ROTARY ENGINE. WILLIAM L. CAGNEY, South Bend, Ind. Filed Dec. 5, 1900. Serial No. 720,727. (No Model.)

Claim.—1. A rotary engine casing comprising two cone frustum-shells bolted together at their bases and having eccentrically-disposed journal-slides at their truncated ends on engine-shaft and pistons adapted to rotate said shaft and conform to the inner conical wall of the casing, substantially as described.

2. The combination with a rotary engine casing in the form of two cone frustums placed base to base and having journal-bearing sleeves extending eccentrically therefrom, of an engine-shaft having a piston-hub formed of two conical ends adapted to fit the tapering inner wall of the casing and pistons fitted to slide diametrically upon said hub and having outer ends to conform to the surface of said casing, substantially as described.

3. The combination with a rotary engine casing having two conical ends and bearing-sleeves eccentric thereto of a shaft, a hub having ends to conform to the conical ends of the casing journal-bearings upon the shaft and within the casing sleeves extending to the conical ends of the hub and pistons having their outer ends adapted to fit the angles of the casing and hub and slidably supported in the hub, substantially as described.

4. In a rotary engine the combination with a casing having cone-shaped ends of a shaft and a hub seated to fit the said casing and supports

eccentrically thereto, of pistons slidably supported in the hub and having the outer ends thereof inclined to conform to the cones of the casing and rounded on their corners with gradually-increasing curves from the inner to the outer ends thereof, substantially as described.

5. In a rotary engine the combination with a casing, a shaft and hub fitted eccentrically within the casing, pistons slidably supported within the hub to project therefrom and having parallel sides to follow the flat cone-shaped ends of the casing and packing-strips having a head to fit a corresponding groove in the sides of the piston, substantially as described.

6. In a rotary engine the combination with the casing of a shaft and a conical hub fitted eccentrically thereon, pistons supported and movable therein, abutment-strips pivotally supported upon the oppositely-inclined walls of the casing and apex abutment-blocks pivoted to the casing between the ends of the abutment-strips to bear against the hub and steam-apertures in the casing leading to the back of the abutment-strips and apex-blocks substantially as described.

7. In a rotary engine the combination with a casing having conical ends of a hub correspondingly coned and fitted therein and two abutment-strips pivoted to the casing to bear against the said conical ends of the hub, substantially as described.

8. In a rotary engine the combination with the engine-casing of the shaft and a journal thereon comprising stepped sections and two bearings fitted upon said stepped sections: one of said bearings being secured to the casing and the other section adapted to be set up independently thereof and a steam-pipe leading to the space between the said bearings, substantially as described.

9. In a rotary engine the combination with the casing of the shaft and a journal thereon comprising an inner coned section a number of short sections of gradually-decreasing diameter, a self-adjusting bearing adapted to said journal-sections, an outer conical journal-section and a bearing adjustably secured to the casing and adapted to the outer cone-shaped journal-section, substantially as described.

10. In a rotary steam-engine the combination of a casing a shaft, a hub and pistons having cone-shaped ends an abutment-strip extending to the end of the hub a shaft-journal having an inner cone extension from the conical end of the hub and a bearing adapted thereto and extending to the end of the said abutment-strip, substantially as described.

11. In a rotary engine, the combination with the casing of the rotary shaft and hub located eccentrically to the inner wall of the casing, slidable pistons carried thereon, a steam-chest, a steam-pipe leading to the top thereof, a rotary steam-valve having a slot passing diametrically through the same, an oscillatory cut-off valve adapted to the steam-valve, and a slide reversing-valve located between the steam-valve and steam-pipe, having ports leading both vertically and laterally therein, and a valve-chamber having ports leading from the lateral parts of the slide-valve and across the axis of the steam-valve.

12. In a rotary engine, the combination with the casing, of the rotary shaft, the rotary pistons, and the rotary steam-valve geared to the said shaft, and having a slot passing diametrically through the same, the oscillatory cut-off valve adapted to the steam-valve, having ports located upon opposite sides thereof, a valve-box having a steam-pipe leading to the outer end of said ports, and an abutment-block upon the valve-box projecting through the said outer port and bearing upon the outer surface of the steam-valve.

702,625. BOX-CAR LOADER. DULAS A. CHAFFELL, DUNVER, Colo., assignor to the Victor Box Car Loader Company, Dunver, Colo., a Corporation of Colorado. Filed Mar. 4, 1901. Serial No. 80,368. (No model.)

Claim.—1. In a box-car loader, the combination of a supporting-carriage formed of two metal I-beams joined together at several points, a supporting-plate provided with a circular opening secured to such supporting-carriage, a turret mounted on such plate, and a flexible conveyor mounted on such turret so as to rotate in a horizontal plane, substantially as described.

2. In a box-car loader, the combination of a supporting-carriage formed of two metal I-beams joined together at two or more points, a two-part plate providing a circular opening secured to the supporting-carriage, a turret rotatably mounted on such two-part plate, a flexible conveyor pivotally mounted on the turret, means for swinging the conveyor in a vertical plane, and means for turning the turret with its conveyor in a horizontal plane, substantially as described.

3. In a box-car loader, the combination of a supporting-carriage formed of two metal I-beams joined together at two or more points, a rotatable turret having an annular groove and a central perforation, a two-part plate secured to the I-beams of the main supporting-carriage and entering the annular groove of the turret, a bridge provided with an upwardly-projecting hub portion entering the central opening of the turret to assist in supporting the same and secured to the I-beams of the main supporting-carriage, a flexible conveyor pivotally secured to the turret, means for swinging the flexible conveyor in a vertical plane, and means for rotating the turret, substantially as described.

4. In a box-car loader, the combination of a supporting-carriage formed of two metal I-beams joined together at two or more points, a rotatable turret provided with upwardly-extending arms or pillars, an annular groove, a central perforation, and a worm-gear on its lower portion, a plate secured to the I-beams and entering the annular groove to rotatably support the turret, a bridge secured to the I-beams and provided with a central upwardly-projecting hub entering the central opening of the turret to assist in supporting the same, a worm in engagement with the worm-gear to rotate the turret, a flexible conveyor arranged in substantially a horizontal plane and pivotally mounted upon the upwardly-extending arms or pillars of the turret, and means for swinging the flexible conveyor in a vertical plane, substantially as described.

5. In a box-car loader, the combination of a supporting-carriage formed of two metal I-beams joined together at two or more points, a rotatable turret provided with an annular groove and a central perforation, plate mechanism secured to the I-beams and entering the annular groove

of the turret to rotatably support the same, a metallic bridge secured to the I-beams and provided with a vertical hub portion entering the central opening of the turret to assist in rotatably supporting the same, a two-faced bevel-gear rotatably mounted on the hub portion between the turret and the bridge members, a conveyor-frame provided with a flexible conveyor pivotally secured to the turret portion in a horizontal plane, gear mechanism engaging with the upper part of the two-faced bevel-gear and the flexible conveyor to operate the same, and means for swinging the flexible conveyor-frame in a vertical plane, substantially as described.

6. In a box-car loader, the combination of a supporting-carriage formed of two metal I-beams joined together at two or more points, a rotatable turret provided with a central groove in its periphery and a central opening and carrying a flexible conveyor arranged in substantially a horizontal plane and adapted to be swung in horizontal and vertical planes, plate mechanism secured to the I-beams of the supporting-carriage and entering the annular groove of the turret, a metallic bridge secured to the I-beams of the main carriage and provided with a central vertical hub entering the central opening of the turret to assist in supporting the same, a two-faced bevel-gear rotatably mounted in the hub in the space between the turret and the bridge members, a main shaft rotatably mounted in the bridge and provided with a bevel-pinion engaging the lower toothed surface of the two-faced bevel-pinion, and a second bevel-pinion arranged opposite the first-named bevel-pinion rotatably mounted in the bridge and engaging the lower toothed surface of the two-faced bevel-gear to act as a balancing idler, substantially as described.

7. In a box-car loader of the class described, the combination of a main supporting-carriage formed of two longitudinal members joined together at two or more points, a turret rotatably mounted on the main supporting-carriage at or near the front end thereof and provided with a flexible conveyor arranged in substantially a horizontal plane and adapted to be swung in horizontal and vertical planes, a threaded shaft, flexible means connecting the threaded shaft with the frame of the flexible conveyor, whereby the longitudinal movements of the threaded shaft impart a swinging movement in a vertical plane to the flexible conveyor and its frame, a rotatable nut, a main shaft, and means for throwing the rotatable nut into and out of engagement with the main shaft to operate it and thereby give the threaded shaft its longitudinal movement, substantially as described.

8. In a box-car loader, the combination of a main supporting-carriage, a turret rotatably mounted on the same at or near its forward end, a conveyor-frame provided with a flexible conveyor arranged in substantially a horizontal plane and pivotally connected to the turret so as to be swung in horizontal and vertical planes, a threaded shaft rotatably mounted in the supporting-carriage and flexibly connected with the conveyor-frame, a rotatable nut on the threaded shaft, the rotations of which impart longitudinal movement to the threaded shaft, a main shaft provided with a wheel, an auxiliary shaft in operative engagement with the main shaft and also provided with a wheel, and means for throwing the threaded nut into engagement with either one or the other of the shafts to impart the desired rotation thereto, substantially as described.

9. In a box-car loader, the combination of a main supporting-carriage, a turret rotatably mounted thereon at or near its forward end and provided with a worm-gear on its lower surface, a frame provided with a flexible conveyor pivotally connected to the upper part of the turret and arranged to be swung in vertical and horizontal planes, a worm-shaft arranged longitudinally of the carriage and provided with a worm engaging the worm-gear on the turret, a main driving-shaft, a supplementary shaft in engagement therewith, an auxiliary shaft in engagement with the worm-shaft at one end and provided with pulley-engaging mechanisms on the main and supplementary shafts, and means for throwing each pulley into and out of engagement with each of such shafts—the main and supplementary—to impart the desired rotation thereto for the operation of the screw-shaft, substantially as described.

10. In a box-car loader, the combination of a main supporting-carriage formed of two metallic I-beams provided with a rotatable turret carrying a flexible conveyor at or near its front end, a main shaft adapted to operate the conveyor, a support for the main carriage provided with a plurality of flanged wheels upon which the I-beams are movably mounted and with a toothed rack, a driving-gear on the supporting-carriage engaging the toothed rack, a stub-shaft mounted transversely in the supporting-carriage with the driving-gear, a bevel-gear in the other end of such stub-shaft geared with the driving-gear, a spur-gear at one end of such stub-shaft, two loosely rotatably mounted bevel-gears on the main shaft in engagement with the bevel-gear, and a clutch slidingly mounted on the main shaft so as to rotate therewith but have independent longitudinal movements for engaging each of the loosely-mounted bevel-pinions to impart rotations in either direction to the main bevel-gear, and thereby to the driving-gear so as to move the supporting-carriage backward and forward, substantially as described.

11. In a box-car loader, the combination of a main supporting-carriage, a conveyor-frame provided with a flexible conveyor arranged in substantially a horizontal plane and pivotally mounted on the main supporting-carriage so as to be swung in the desired plane, flanged sides connected with the conveyor-frame on each side of the flexible conveyor so as to confine the same for a portion only of the length of the flexible conveyor, and a single flange pivotally secured to the conveyor-frame so as to cover one of the open sides of the flexible conveyor and be moved to the opposite side and back again, substantially as described.

12. In a box-car loader, the combination of a supporting-carriage, a conveyor-frame pivotally secured thereto, rotatable shafts in the conveyor-frame rotatably mounted in or near each end thereof, a conveyor formed of flexible belt mechanism passed around the shafts above mentioned and carrying a plurality of flights, and flights secured thereto and formed of the horizontal members and upwardly-extending rear members secured to the flexible belt at or near their forward edges so as to give their rear edges an increased impulse while making the discharging-turn, substantially as described.

13. In a box-car loader, a conveyor formed of a plurality of flexible elements, a plurality of flights having a horizontal or base portion, an upwardly-extending portion at the rear edge thereof, and a downwardly-extending portion overlapping the forward edge of the next succeeding flight, and means for securing the flights to the flexible elements at or near the forward edges, whereby the rear portion of the flights is given an accelerated motion as it reaches the turn at the discharging-point, substantially as described.

14. In a box-car loader, the combination of a supporting-carriage, a supporting-plate secured thereto and provided with an inner circular opening forming an inner circular edge adapted to enter the annular groove of a turret mounted on such supporting-plate, a turret consisting of a single unitary structure rotatably mounted upon such supporting-plate and provided with an annular groove arranged to admit the inner edge of the supporting-plate, and a flexible conveyor mounted upon such turret and rotatable therewith, substantially as described.

702,626. BALING-PRESS. FRANK M. CHAFFELL, BOWERS, Ga. Filed Oct. 14, 1901. Serial No. 78,410. (No model.)

Claim.—1. In a baling-press, the combination of a pair of oppositely-disposed connected press-boxes, followers in the said press-boxes, a shaft journaled in a bearing disposed between said press-boxes, said shaft having a crank, connections between the latter and said followers, to move said followers simultaneously, when said shaft is oscillated, an extensible lever secured to the said shaft, independently-revoluble power elements mounted on the said press-boxes and flexible connections between said power elements and the outer portion of said extensible lever, substantially as described.

2. In a baling-press, the combination of a pair of oppositely-disposed connected press-boxes, followers in the said press-boxes, a shaft journaled in a bearing disposed between said press-boxes, said shaft having a crank, connections between the latter and said followers, to move said followers simultaneously, when said shaft is oscillated, an extensible lever secured to the said shaft, independently-revoluble power elements mounted on the said press-boxes and flexible connections between said power elements and the outer portion of said extensible lever, substantially as described.

connected press-boxes, followers in the said press-boxes, a shaft journaled in a bearing disposed between said press-boxes, said shaft having a crank, connections between the latter and said followers, to move said followers simultaneously when said shaft is oscillated, an arm secured to said shaft, an extensible sweep-lever secured to said arm, independently-revoluble power elements mounted on the said press-boxes and flexible connections between said power elements and the outer portion of said extensible lever, substantially as described.

702,627. LAND-RECLAIMING DOCK. EPHRAIM CHAQUETTE, New Rochelle, N. Y. Filed Oct. 6, 1901. Serial No. 77,861. (No model.)

Claim.—1. A land-reclaiming dock adapted to be moved near the locality to be reclaimed and provided with a waterway which allows the passage of scows or other vessels through the same, receiving channels or vats arranged transversely thereunder and inclined toward the pump side, and suitable pumping and conveying apparatus by which the dredged material received from said scows or other vessels may be conveyed to or deposited on said locality substantially as described.

2. A land-reclaiming dock provided with a suitable waterway, receiving-vats thereunder, pumping and conveying apparatus, and a stirring and agitating chain at the bottom of each vat and adapted to feed the dredged material to the pump, substantially as described.

702,628. CLAM-DREDGE. EPHRAIM CHAQUETTE, New Rochelle, N. Y. Filed Jan. 7, 1902. Serial No. 88,768. (No model.)

Claim.—1. The above-described dredge which consists of a suitable boat provided with a stationary frame projecting over one end thereof, two independently-operated clams mounted upon said frame and adapted to be moved in the direction of the boat's width and their operating mechanism, and a pair of inclined troughs mounted upon said frame and adapted to be tipped so as to receive the excavated material from said clams both in their converging and diverging positions, substantially as and for the purpose set forth.

2. The above-described dredge which consists of a suitable boat provided with a stationary frame projecting over one end thereof, two independently-operated clams mounted upon said frame and adapted to be moved in the direction of the boat's width and their operating mechanism, and a pair of converging troughs mounted upon said frame and adapted to receive the excavated material from said clams and convey it to the

middle of the boat and an inclined trough extending lengthwise of said boat and adapted to receive the excavated material from said conveying-troughs and convey it to the end of said boat substantially as and for the purpose set forth.

3. The above-described clam-dredge which consists of a suitable boat, a stationary frame mounted thereon and extending over one end thereof, a clam mounted on said frame and adapted to rise and fall vertically beyond the end of said boat, a collapsible apron mounted upon said frame adapted to open in advance of said clam in its descent and to be closed by said clam in its ascent, and suitable troughs adapted to receive the excavated material from said collapsible apron substantially as and for the purpose set forth.

4. A clam-dredge provided with a pair of receiving and conveying troughs hung upon a suitable frame and adapted to converge toward each other and deliver the excavated material to a central trough or to diverge from each other and discharge the excavated material over the sides of said dredge substantially as shown and described.

702,629. CLAM FOR DREDGING. EPHRAIM CRAGGHEIT, New Rochelle, N. Y. Filed Feb. 26, 1902. Serial No. 95,512. (No model.)

Claim.—The above-described clam for dredges which consists of a shell composed of two hinged portions pivoted upon a suitable frame, a guide-rod mounted on said frame, a cylinder mounted upon said guide-rod and pivoted to one of said hinged portions of the shell, a piston adapted to work in said cylinder and an arm loosely mounted on said guide-rod near the other end and pivoted to the other hinged portion of the shell, the said arm supporting the outer end of said piston, and means substantially as described for operating said piston-rod, so as to open and close said clam.

702,680. VARIABLE-SPEED SHAFT. BENJ. CHRISTENSEN, Portland, Ore. Filed July 15, 1901. Serial No. 63,202. (No model.)

Claim.—1. The combination of a shaft, a hub element thereon, having radial slots, a plurality of radially-disposed ball-crank levers disposed transversely of said slots, pivoted to said hub element and having circumferentially-grooved segments at their outer ends adapted to engage an endless flexible power-transmitting element, a ring to which the inner ends of said ball-crank levers are pivotally connected, and a shiftable sleeve, on said shaft, having an annular groove engaged by said ring, substantially as described.

2. A variable-speed shaft, comprising a hub element having radial slots, a plurality of radially-disposed ball-crank levers pivoted to said hub element, having their outer arms disposed in and transversely of the slots and provided at their outer ends with circumferentially-grooved segments adapted to engage an endless flexible power-transmitting element, and means, connected to the inner arms of the ball-crank levers, to turn the latter on their pivots and thereby vary the radius of the grooved segments, substantially as described.

702,680.

702,681. STOCK-CAR. JOHN F. CLARK, Chicago, Ill. Filed Aug. 14, 1901. Serial No. 72,202. (No model.)

Claim.—1. In a car, the combination of the car-frame mounted on trucks and wheels, with the car-body having the side edges of its bottom projecting outwardly from the upright sides thereof, upright standards secured to the sides of the car-frame and having on their upper ends rollers to downwardly impinge the projecting side edges of the bottom of the car-body, rollers journaled to the lower surface of the bottom of the car-body and resting on the frame, and springs interposed between the car-frame and body, substantially as described.

2. In a car, the combination with the car-body having on its inner surfaces of its sides longitudinally-extending angle-rails, of a series of movable partitions having at their upper portions angle-brackets in engagement with said rails and at their vertical edges openings, pins or bolts passing through suitable openings in the sides of the car and engaging the openings in the partitions to adjustably secure them in place, and means to raise and suspend said partitions, substantially as described.

702,682. ATTACHMENT FOR ROCKING-CHAIRS. DENNIS F. CLAYTON, Chicago, Ill. Filed Dec. 18, 1901. Serial No. 98,148. (No model.)

Claim.—1. In an attachment for rocking-chairs, the combination with a clamp secured to the arm-rest of the chair and having an outwardly and upwardly extending shaft, of a segmental gear mounted on the horizontal portion of said shaft, a pinion journaled on the upright portion of said shaft and meshing with the segmental gear, a fin-holder mounted on the upper surface of the pinion, two levers pivotally and adjustably secured on one of the rockers and connecting-pieces uniting said levers and the ends of the segmental gear, substantially as described.

2. In an attachment for rocking-chairs, the combination with a clamp secured to the arm-rest of the chair and having an outwardly and upwardly extending shaft, of a segmental gear mounted on the horizontal portion of said shaft, a pinion journaled on the upright portion of said shaft and meshing with the segmental gear, a fin-holder mounted on the upper surface of the pinion, means pivotally secured on one of the rockers to contact with the floor and connecting-pieces uniting said means and the ends of the segmental gear, substantially as described.

702,683. APPARATUS FOR GLAZING GLASS. THOMAS OLDHAM, JR., and CHARLES BENTON, Charlottesville, W. Va. Filed July 22, 1901. Serial No. 68,212. (No model.)

Claim.—1. In an apparatus for glazing glass articles, the combination of a holder for the article and a heat-applying mechanism, and means for shifting one of said parts relatively to the other, the heat-applying mechanism being inclined in a direction relative to the line of travel of the movable part or element whereby the glass article is progressively heated along and around its exterior surface, substantially as set forth.

2. In an apparatus for glazing glass articles, the combination of two or more appliances for applying heat to the articles, said appliances being arranged in different planes relative to the path of movement of the articles, holders for the articles and means for moving the holders in suitable proximity to the heaters, the heating appliances being so arranged relative to the movement of the holders that the heat will be applied progressively along and around the articles, substantially as set forth.

3. In an apparatus for glazing glass articles, the combination of a combustion-chamber having two or more outlets arranged in different

planes, a carrier, holders for the articles mounted on the carrier, means for rotating the holders and means for shifting the carrier, whereby the articles are carried past the heat-outlets in succession and rotated during such movement, substantially as set forth.

4. In an apparatus for glazing glass articles, the combination of a circular combustion-chamber having two or more outlets arranged in different planes, one or more intermediate outlets arranged at an angle to the other outlets, a rotating carrier, holders for the articles mounted on the carrier and means for rotating said holders, substantially as set forth.

702,684. MECHANISM FOR FEEDING GLASS TO HOLDS. THOMAS OLDHAM, JR., Charlottesville, W. Va. Filed July 22, 1901. Serial No. 68,214. (No model.)

Claim.—1. In an apparatus for forming glass articles, the combination of a shaping-mold, a receiving-basin, a cutting mechanism, means whereby the same is operated on the reception by the basin of a predetermined amount of glass and means for shifting the basin to deposit the glass into the mold, substantially as set forth.

2. In an apparatus for forming glass articles, the combination of a shaping-mold, a counterweighted receiving-basin, a cutting mechanism, means controlled by the basin for operating the cutting mechanism and for effecting a discharge of the glass contained in the basin, substantially as set forth.

3. In an apparatus for forming glass articles, the combination of a shaping-mold, a weighing mechanism, including a receiving-basin as a part thereof, a cutting mechanism controlled by the weighing mechanism, and means for shifting the basin controlled by the weighing mechanism, substantially as set forth.

4. In an apparatus for forming glass articles, the combination of a shaping-mold, a lever having an adjustable weight at one end, a sectional receiving-basin supported by the opposite end of the lever, a cutting mechanism controlled by the lever and means for separating the sections of the basin, substantially as set forth.

702,685. LOOM FOR WEAVING BORDERED FABRICS. GEORGE W. CONROCK and FRED E. WARREN, Woonsocket, R. I., assignors, by direct and mesne assignments, to the Feltex Mills, Fall River, Mass., a Corporation of Massachusetts. Filed June 5, 1902. Serial No. 682,867. (No model.)

Claim.—1. In a loom, the combination of a cam-shaft, means loosely mounted on said shaft and having a clutch-disk, the harness operated by the same, a sleeve arranged to slide on and turn with the shaft and having a clutch-disk adapted to engage that of the cam, a pattern, a drive-shaft therefor, a finger arranged to be engaged by tappets of the pattern and connected with the sleeve-clutch member, a spring for normally holding the sleeve in engagement with the cam, a crank on the cam-shaft, a pattern-shaft, a ratchet-wheel fixed on the pattern-shaft, a lever loose on

the pattern-shaft and connected with the crank of the cam-shaft, a pawl on the lever having an arm, a second finger arranged to be engaged by tappets of the pattern, and a bell-crank lever connected with said second finger and having a tappet arranged to engage the arm of the pawl, substantially as specified.

2. In a loom, the combination of a cam-shaft, cam loosely mounted on said shaft and having a clutch-flange, a harness operated by the cam, a sleeve arranged to slide on and turn with the shaft and having a clutch-flange adapted to engage that of the cam, a pattern, a pattern-shaft, one or more fingers arranged to be engaged by tappets of the pattern and connected with the sleeve-clutch member, a spring for normally holding the sleeve in engagement with the cam, a crank on the cam-shaft, a ratchet-wheel fixed on the pattern-shaft, a lever loose on the pattern-shaft and connected with the crank of the cam-shaft, a pawl on the lever having an arm, a second finger arranged to be engaged by tappets of the pattern, a bell-crank lever connected with said second finger and having a tappet arranged to engage the arm of the pawl, and also having a lateral arm, mechanism for taking up the cloth as it is woven, and device connected with the lateral arm of the bell-crank lever and operated by the take-up mechanism for releasing the pawl, substantially as specified.

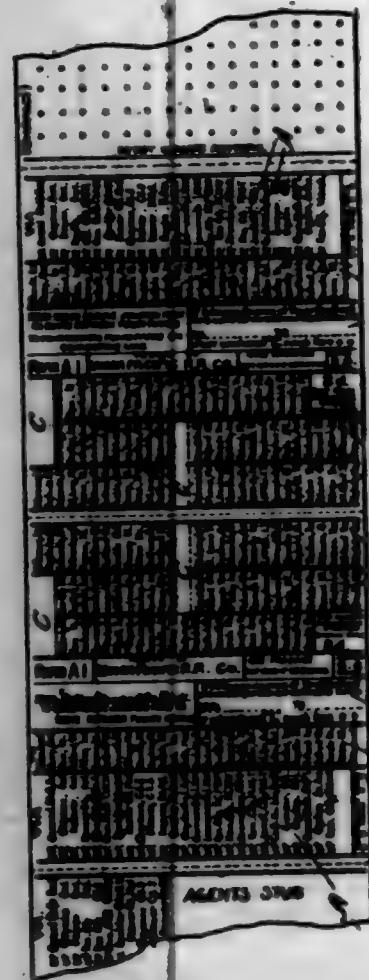

3. In a loom, the combination of a harness, a shaft, a driving connection from the shaft to the harness for actuating the latter; said connection comprising a harness-stop-motion device, a pattern, suitable means controlled by the pattern for moving the stop-motion device and causing the harness to dwell, mechanism intermediate of the shaft and the pattern for separating the pattern; said mechanism comprising a pattern-stop-motion device controlled by the pattern, mechanism for taking up the cloth as it is woven comprising a ratchet-wheel, a dog actuated by the shaft for rotating the ratchet-wheel, a grating pawl arranged to engage the ratchet-wheel, means operated by the pattern for disengaging said pawl from the ratchet-wheel, and mechanism controlled by the take-up mechanism for releasing the stop-motion device of the pattern-operating mechanism, substantially as specified.

4. In a loom, the combination of the harness, a shaft, a driving connection from the shaft to the harness for actuating the latter; said connection comprising a stop-motion device, a pattern provided with tappets, fingers arranged to be alternately engaged by different tappets of the pattern, and a connection common to the two fingers interposed between said fingers and the stop-motion device, substantially as specified.

702,886. RAILROAD-TICKET. TON G. DAVIES, Omaha, Neb., assignor of 66 2/3% to Robert A. Smith, Omaha, Neb. Filed June 17, 1901. Serial No. 64,567. (No specimens.)

Claim.—1. A railroad-ticket coupon provided with a list of routes each composed of the initial line of road, a junction-point upon said line, and a connecting line of road, the junction-point upon said initial line being repeated in said list in connection with each line of road connecting with the initial line at each junction-point, and the names of the initial and connecting lines and intermediate junction-points composing each route being arranged in a distinct group in said list, whereby the entire route may be indicated by a single punching operation; substantially as described.

may be indicated by a single punching operation; substantially as described.

2. A railroad-ticket coupon provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, the name of each connecting line being repeated in said list in connection with each junction-point at which it connects with the initial line, and the names of the initial and connecting lines and intermediate junction-points composing each route being arranged in a distinct group in said list, whereby the entire route may be indicated by a single punching operation; substantially as described.

3. A railroad-ticket coupon provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, each junction-point being repeated in said list at each junction-point, and the name of each connecting line of road being also repeated in said list in connection with each junction-point at which it connects with the initial line, and the names of the initial and connecting lines and intermediate junction-points composing each route being arranged in a distinct group in said list, whereby the entire route may be indicated by a single punching operation; substantially as described.

4. A railroad-ticket coupon provided with a list of routes each composed of the initial line of road, a junction-point upon said line, and a connecting line of road, whereby the entire route may be indicated by a single punching operation, and each route requiring a transfer between depots at each junction-point being provided with an indication to that effect.

5. A railroad-ticket coupon provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, and with a list of destination-stations upon each connecting line, the names of the initial and connecting lines and intermediate junction-points composing each route being arranged in a distinct group in said list, whereby the entire route may be indicated by a single punching operation, and whereby the entire route of the ticket over the initial and connecting lines, and the destination-station, may be indicated by two punching operations; substantially as described.

6. A railroad-ticket coupon provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, and with the names of destination-stations upon said connecting lines, the name of each junction-point upon the initial line being repeated in connection with each line of road connecting with the initial line at each junction-point; substantially as described.

7. A railroad-ticket coupon provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, and with the names of destination-stations upon said connecting lines, the name of each connecting line of road being repeated in

the list of routes in connection with each junction-point at which it connects with the initial line; substantially as described.

8. A railroad-ticket coupon provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, and with the names of destination-stations upon each connecting line, each junction-point upon the initial line being repeated in the list of routes in connection with each connecting line connecting with the initial line at each junction-point, and each connecting line being repeated in said list in connection with each junction-point at which it connects with the initial line; substantially as described.

9. A railroad-ticket form comprising a contract portion and a plurality of coupons each provided with a like list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, and with the names of destination-stations upon said connecting lines, the names of the initial and connecting lines and the intermediate junction-points composing each route in said list of routes being arranged in said list, whereby the entire route may be indicated by a single punching operation, and the lists of routes and destination-stations upon the respective coupons being so arranged as to register with each other when the coupons are folded one upon another, whereby the entire route of the ticket over the initial and connecting lines, and the destination-station, upon all of the coupons may be indicated by two punching operations, and a separate coupon having the route and destination-station unambiguously indicated upon it to be provided for each line of road; substantially as described.

10. A railroad-ticket form comprising a plurality of regular passage-coupons and a supplemental extension-coupon, each of said coupons being provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, and with the names of destination-stations upon said connecting lines, and the extension-coupon being also provided with appropriately designated spaces for the insertion of the name of any line of road connecting with any of the connecting lines included in the list of routes and the name of any station upon said line of road, whereby the ticket may be issued to any station upon any line of road connecting with the initial line by two punching operations, to indicate the route and destination-station, and each route and station be likewise indicated upon the extension-coupon, and may be extended from each station to any station upon any line of road leading from each station by inserting the name of the last-mentioned line of road and the final destination-station thereon in the spaces provided therefor upon the extension-coupon; substantially as described.

11. A railroad-ticket form comprising a contract portion, a plurality of regular passage-coupons projecting from one end thereof, and a supplemental extension-coupon projecting from the opposite end thereof, each of said coupons being provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, and with the names of destination-stations upon said connecting lines, and the extension-coupon being also provided with appropriately designated spaces for the insertion of the name of any line of road connecting with any of the connecting lines included in the list of routes and the name of any station upon said line of road, whereby the ticket may be issued to any station upon any line of road connecting with the initial line by two punching operations, to indicate the route and destination-station, and each route and station be likewise indicated upon the extension-coupon, and may be extended from each station to any station upon any line of road leading from each station by inserting the name of the last-mentioned line of road and the final destination-station thereon in the spaces provided therefor upon the extension-coupon; substantially as described.

12. A railroad-ticket form comprising a contract portion, a plurality of regular passage-coupons projecting from one end thereof and by means of which the ticket may be issued to any one of a plurality of terminal points, a supplemental extension-coupon projecting from the opposite end of the contract portion of the ticket form and provided with appropriately designated spaces for the insertion of the name of a connecting line of road leading from each terminal point and the name of a final destination-station thereon, and a transfer-coupon projecting from the end of the extension-coupon opposite the contract portion of the ticket, to cover the passenger's transfer between the station of the road over which the last regular passage-coupon reads and the station of the road over which the supplemental extension-coupon is made to read; substantially as described.

13. A railroad-ticket form comprising a contract portion, a plurality of regular passage-coupons projecting from one end thereof, a supplemental extension-coupon projecting from the other end of the extension-coupon, and a transfer-coupon projecting from the center end of the extension-coupon, each and all of said coupons being provided with a list of routes each composed of the initial line, a junction-point upon said line, and a connecting line of road, and with the names of destination-stations upon said connecting lines, whereby the ticket may be issued to any of the destination-stations upon the connecting lines over any of the routes in the list by indicating each route and station with suitable punch-marks, and the entire route

of the ticket and primary destination-station be thereby indicated upon all of the coupons, including the extension and transfer coupons, and the extension-coupon being further provided with appropriately designated spaces for the insertion of the name of any line of road leading from any one of said stations and the name of any station upon said line of road, whereby the ticket may be extended to read from the primary destination-station indicated by the punch-marks to any station upon any line of road leading from each primary destination-station, and the transfer-coupon being further provided with appropriately designated spaces for the insertion of the name of the terminal line of road and the final destination-station thereon; substantially as described.

14. A railroad-ticket form comprising a plurality of passage-coupons, an agent's stub, and a transfer-coupon sent to the agent's stub and detachable therefrom, but adapted if a transfer is required to be reattached to the back of one of the passage-coupons and to extend beneath the immediately-preceding coupon in position for use for transfer between the depots used by the two lines of road over which the said coupons respectively read; substantially as described.

15. A railroad-ticket form comprising a plurality of passage-coupons, an agent's stub, and a detachable transfer-coupon adapted to be permanently detached from the ticket if no transfer is required in the route over which the ticket is issued, and provided with a gummed margin by means of which, if such a transfer is required, it may be pasted to the back of one of the passage-coupons in position to underlie the immediately-preceding passage-coupon and be used for transfer between the depots of the two lines of road over which said coupons respectively read; substantially as described.

16. A railroad-ticket form comprising a plurality of passage-coupons and provided at one extremity with a transfer-coupon detachable from the ticket without mutilation of the latter and adapted if a transfer is required in the route of the ticket to be reattached to the back of one of the passage-coupons and to extend beneath the immediately-preceding coupon; substantially as described.

17. A railroad-ticket form comprising a plurality of passage-coupons and provided at one extremity with a transfer-coupon having a gummed margin, said transfer-coupon being detachable from the ticket without mutilation of the latter, and adapted if a transfer is required in the route of the ticket to be reattached to the back of one of the passage-coupons and to extend beneath the immediately-preceding coupon; substantially as described.

18. A railroad-ticket form comprising a plurality of coupons and an agent's stub, and provided with a transfer-coupon at the extremity of the ticket adjacent said agent's stub, said transfer-coupon being detachable from the ticket with the agent's stub and provided with a gummed margin adapting it, if a transfer is required in the route of the ticket, to be reattached to the back of one of the passage-coupons and to extend beneath the immediately-preceding coupon; substantially as described.

19. A railroad-ticket form comprising a plurality of passage-coupons, an agent's stub, and a detachable transfer-coupon each of said coupons and the agent's stub being provided with a list of routes and a list of destination-stations, each of said routes composed of the initial line of road, a junction-point thereon, and a connecting line of road, and each route requiring a transfer at each junction-point having that fact indicated in the name of the route in said list, whereby the route of the ticket and destination-station and the fact as to whether a transfer is required at the junction-point may be indicated upon each of the coupons and the agent's stub by two punching operations, and said detachable transfer-coupon being adapted to be reattached to the back of one of the passage-coupons and underlie the immediately-preceding coupon, in position for use for the transfer of the passenger between the depots used by the two lines of road over which said coupons respectively read; substantially as described.

20. A railroad-ticket form comprising a plurality of passage-coupons, an agent's stub, and a detachable transfer-coupon each of said coupons and the agent's stub being provided with a list of routes and a list of destination-stations, each of said routes composed of the initial line of road, a junction-point thereon, and a connecting line of road, and each route requiring a transfer at each junction-point having that fact indicated in the name of the route in said list, whereby the route of the ticket and destination-station and the fact as to whether a transfer is required at the junction-point may be indicated upon each of the coupons and the agent's stub by two punching operations, and said detachable transfer-coupon being provided with a gummed margin for its reattachment to the back of one of the passage-coupons in position to underlie the immediately-preceding coupon and be used for transfer between the depots of the two lines of road over which said coupons respectively read; substantially as described.

21. A railroad-ticket comprising a contract portion, a plurality of regular passage-coupons projecting from one end thereof, a supplemental extension-coupon projecting from the opposite end thereof, a transfer-cou-

pen projecting from the outer end of the extension-coupen and adapted to be used for the transfer between the depot of the road over which the last regular passage-coupen route and the depot of the road over which said extension-coupen route, and said ticket-form being provided at its end opposite said extension and transfer portions with a detachable transfer-coupen adapted, if a transfer be required in the route over which the regular passage-coupen of the ticket road, to be reattached to the back of one of said passage-coupen and to extend beneath the immediately-preceding coupon and be used for transfer between the depots of the two lines of road over which said coupons respectively read; substantially as described.

702,687. CARBURETER. MILES S. DUNHAM, Butteville, W. Va., assignor of one-half to Franklin W. Hether, Jesse A. L. Hether, and Ernest W. Hether, Butteville, W. Va. Filed Apr. 12, 1900. Serial No. 12,788. (No model.)

Claim.—In a gas-generator, the combination with a series of tanks for containing hydrocarbon liquid, each provided with an inlet-pipe having a regulating-cock, and an outlet-pipe having a regulating-cock, of a single air-inlet and mixing pipe connected with the inlet and outlet pipes of all of said tanks, said air-inlet and mixing pipe having one end open to the atmosphere and provided with a series of cocks located between the connections of the air-inlet and mixing pipe with the inlet and outlet pipes of each tank, whereby a communication may be established from the air-inlet directly through said air-inlet and mixing pipe in addition to the communication between the air-inlet and mixing pipe and said tanks, substantially as described.

702,688. RETORT HYDROCARBON-BURNER. ALFRED D. DUNHAM, Galveston, Tex., and WILLIAM H. WATERS, Chicago, Ill. Filed July 1, 1901. Serial No. 64,991. (No model.)

Claim.—1. The combination with a retort having a discharge-opening and another opening in its lower portion, of a tube extending into the retort and having communication with a supply of steam or air, a pipe extending through said tube into the retort and communicating with a supply of oil, a valve seated on the end of said pipe in the retort and having on its lower surface a series of curved corrugations, and means to control the flow of oil, air or steam, substantially as described.

2. The combination with a retort having a discharge-opening and another opening in its lower portion, of a tube extending at one of its ends through said lower opening into the retort and having a communication with a supply of steam or air under pressure, a pipe extending through said tube into the retort and communicating with a supply of oil under pressure, a flaring valve-seat on the end of the pipe in the retort, a gravity-valve located in said seat and having on its lower surface a series of curved corrugations, substantially as described.

3. The combination with a furnace, of a casing covered in the front

plate thereof and having a discharge-opening in its bottom and front, a retort on said casing and having a discharge-opening communicating with the fire-box and another opening communicating with the casing, a tube extending through the casing and into the retort and connected to a supply of steam or air, a pipe extending through said tube into the retort and connected to a supply of oil, a drip-cup on the lower portion of said pipe, a valve seated on the end of said pipe in the retort, means to control the flow of oil, and means to control the flow of air and steam, substantially as described.

4. The combination with a furnace, of a retort supported on the front plate thereof and having a discharge-opening communicating with the fire-box and another opening in its lower portion, hinged plates seated to the furnace to protect the top and front of the retort, a burner located in the retort and having communication through the opening in the lower portion thereof with a reservoir containing oil and air, or oil and steam under pressure, substantially as described.

5. The combination with a retort having a discharge-opening and another opening in its lower portion, of a tube extending at one of its ends through said lower opening into the retort and having a communication with a supply of steam or air under pressure, a pipe having on its upper outer surface spiral ribs and extending through said tube into the retort and communicating with a supply of oil under pressure, a flaring valve-seat on the end of the pipe in the retort, a gravity-valve located in said seat and having on its lower surface a series of corrugations curved in the opposite direction from the curve of the ribs on the pipe, substantially as described.

702,689. GRAIN-VENTING MACHINE. WILLIAM E. DUTCHER, Auburn, R. I. Filed Feb. 7, 1902. Serial No. 22,967. (No model.)

Claim.—1. As a new and improved article of manufacture, a grain-venting machine provided with a casing arranged to receive therein an original or factory box of grain, a manually-actuated cigar selecting and carrying device working in an opening formed in said casing adapted to select any visible cigar in the box and convey it therefrom, and means for automatically releasing the selected cigar and discharging it from the machine, substantially as described.

2. In a grain-venting machine, arranged to receive a factory-box of cigars, having its casing provided with a slotted opening and a passage through which the cigars are dispensed, the combination therewith of a filter member or device capable of being moved back and forth in said opening and adapted to be detachably secured to any visible cigar in the box, and means for automatically releasing the cigar from said filter member into said passage, substantially as described.

3. In a grain-venting machine arranged to receive therein an origi-

nal or factory box of cigars, a longitudinally-movable member or carrier provided with a vertically-movable cigar-selecting device or filter arranged with respect to the box of cigars, a movable stop or lever for limiting the forward movement of said carrier in case the cigar-selecting device is not sufficiently elevated, and mechanisms for automatically releasing the carrier from said stop and detaching the cigar from the filter, substantially as described.

4. In a cigar-venting machine, the combination with the casing having a slotted opening formed in its cover, of the carrier slidably mounted in said opening, the cigar-selecting device or filter vertically movable in said carrier, a flexible member arranged to automatically close the exposed portion of said opening, and means for automatically releasing the cigar from said filter, substantially as described.

5. In a cigar-venting machine, the combination with a spring-pressed lever as provided with a notch or abutment, of a sliding carrier-bar having a follow abutment on its under side adapted to engage with that of said lever, and a vertically-movable filter or cigar-selecting member having a dog or cam arranged to contact with the free end of the lever, whereby the latter is retracted to permit the passage of said bar, substantially as described.

6. In a cigar-venting machine, provided with a casing having a slotted opening communicating with the interior chamber containing a factory-box of cigars, the combination of a carrier member slidable in said opening, a vertically-movable filter, mounted in said carrier, having its lower portion adapted to have a cigar attached thereto, fixed ways arranged to receive and support said filter and means for automatically releasing the cigar from the filter member while the latter is in engagement with said ways, substantially as described and for the purpose set forth.

7. In a cigar-venting machine, provided with fixed ways d, a suitably-guided combined cigar selecting and lifting member c capable of being moved both laterally and endwise or vertically, and having its under side or head portion arranged to be supported by said ways, thereby for the time being locking the member c against any movement in a vertical direction, substantially as described.

8. In a cigar-venting machine, provided with fixed ways d and dogs or cams d', a suitably-mounted movable filter member c having its lower end provided with means adapted to select and retain a cigar, arranged whereby upon sliding the member c onto said ways the cigar will engage the same thereof and be freed from the filter, the latter meanwhile being prevented from vertical movement.

702,640. HINGE. PATENT DYM, Pasadena, Cal., assignor of one-half to Henry T. Dym and George E. Marple, Los Angeles, Cal. Filed Oct. 2, 1902. Serial No. 22,968. (No model.)

Claim.—1. A strap-hinge, composed of two hinge-sections, having necessary screw-holes, united by a pin-bolt, each of which sections is formed from a single blank, longitudinally separated in the center thereof a portion of its length, the separated portions bent outwardly, as shown, to impart bracing strength therein.

2. In a hinge, a leaf formed from a single metal blank longitudinally separated at one end for a portion of its length into equal portions, said portions being bent outward and provided with pin-bolts thereby forming separated bearing members, substantially as described.

3. In a hinge the combination with a leaf formed from a single metal blank separated centrally and longitudinally for a portion of its length, at one end, the separated portions provided with pin-bolts and bent outwardly thereby forming braced bearing-arms and a V-shaped space between said portions, of a complementary hinge-leaf having a pin-bolt adapted to be seated between the knuckles of the braced bearing-arms of the other leaf, and a pin-bolt pivoting the two leaves, substantially as described.

4. In a hinge, a leaf formed from a single blank, longitudinally separated in the center thereof a portion of its length, the separated portions bent outwardly, as shown, to impart bracing strength therein.

5. In a hinge, the combination with a leaf formed from a single metal blank separated longitudinally for a portion of its length, at one end, the separated portions provided with pin-bolts and bent outwardly thereby forming braced bearing-arms and a V-shaped space between said portions, of a complementary hinge-leaf having a pin-bolt adapted to be seated between the knuckles of the braced bearing-arms of the other leaf, and a pin-bolt pivoting the two leaves, substantially as described.

6. In a hinge, a leaf formed of a single metal blank longitudinally

separated at one end for a portion of its length into equal portions, said separated portions being bent outward to impart bracing strength and provided with screw-bolts; said united portion being bent to form a pin-bolt-knuckle.

7. Is a hinge, a leaf formed of a single metal blank longitudinally separated at one end for a portion of its length into equal portions, said separated portions being bent outward to impart bracing strength and provided with screw-bolts; said united portion being bent to form a pin-bolt-knuckle in combination with a companion leaf having separated pin-bolt-knuckles adapted for the reception therebetween of the pin-bolt-knuckle of the first section and a pin-bolt adapted to unite said section.

702,641. BRACING. JAMES H. EVERETT, Pacific, Mo. Filed June 17, 1901. Serial No. 64,796. (No model.)

Claim.—A bearing comprising a suitable axle-box, an oil-collar confined within the same, lateral flanges formed with the walls of the collar, ribs disposed along the inner walls of the box below the flanges, wedges interspersed between the flanges and ribs, means for securing the wedges to the walls of the box, an axle having an enlarged portion confined within the oil-collar, and having a peripheral groove exterior thereto snugly embraced by the walls of the openings formed in the axle-box and oil-collar respectively, substantially as set forth.

702,642. NUT-LOCK. CHRISTIAN W. FARR, Jr., Troy, N. Y., assignor of one-third to Edward E. Farr, Troy, N. Y. Filed Feb. 21, 1902. Serial No. 22,969. (No model.)

Claim.—In a nut-lock, the combination with the nut and bolt, of a plate A having openings at opposite ends through which the bolt is adapted to pass, the said plate being bent around the nut and across the face thereof, a reduced portion of the outer end of the plate adapted to be bent down alongside of the nut and provided with ribs at opposite sides thereof, and a tongue, substantially as shown and for the purpose set forth.

702,643. GOLD-SEPARATOR. CHARLES W. GARDNER, Portland, Ore. Filed May 17, 1901. Serial No. 63,971. (No model.)

Claim.—1. The combination in a gold-separator of a shell or casing, a grating or screen upon which the gravel is received and grading or sifting

being inclined in the direction of the length of the shell or casing, a second screen inclined in the direction of the width of the shell or casing and discharging laterally through the side walls thereof, a chute leading from the side of the shell or casing and a chute in line longitudinally with the shell or casing, a ferrous plate below the second screen and extending longitudinally of the casing, and a water-supply adapted to discharge upon the screens in opposition to the flow of gravel thereon.

2. The combination is a gold-separator of a shell or casing inclined except at the top, a grating or screen within the casing and inclined in the direction of the length thereof, links suspending said screen, a second screen within the casing and receiving the discharge from the first-named screen, and inclined from substantially the center of the casing toward each side thereof, links suspending the second screen within the framework, a discharge-chute leading outwardly from the side of the casing and receiving the discharge from the second-named screen, a ferrous plate below the second-named screen, and a water-supply having nozzles discharging upon the gravel on the screens in a direction contrary to the flow of material thereon.

3. In a gold-separator, the combination with a chamber inclosed except at the top, of an inclined grating or screen, a secondary set of screens disposed transversely to said grating, and inclined toward each side of the chamber, extensions of said secondary screens through the side walls of said chamber, separate water-inlets through said side walls by which a stream of water is adapted to be directed upon each of said screens, deflecting-plates whereby the gravel entering the machine is directed away from said inlets and upon the screens and means including a rifled chute by which the gold from said screens is collected.

4. A gold-separator consisting in combination of a casing open at the top, screening devices and links by which they are suspended within said casing, said devices consisting of a grating, oppositely-disposed screens arranged transversely to, and receiving and dividing the overflow from said grating, chute extensions of said screens through the side walls of said casing, a perforated plate beneath said grating and screens and inclined substantially in the same direction as the grating, riffles beneath said plate, a flume extending through said casing in the direction of the length thereof, a water-supply having nozzles entering a plurality of the sides of said casing, each of said nozzles adapted to direct its flow upon a respective grating, and screens and deflecting-plates disposed in relation to each of said nozzles.

702,644. CAR-WHEEL. MAX F. SHERRIN, Waverly, Mo. Filed Jan. 31, 1902. Serial No. 91,908. (No model.)

Claim.—1. A railway-car wheel provided with an annular groove at the junction of its flange and rim, and a central opening having its outer mouth flaring.

2. A railway-car wheel, comprising the central hub having an axle opening therethrough with a flaring outer mouth and a recess the full length of the opening, a periphery integral with the hub and a flange extending beyond said periphery, said periphery and flange being provided with an annular groove at their junction.

702,645. DENTAL IMPRESSION-CUP. WILLIAM E. GRISWOLD, Denver, Colo., assignor, by direct and mesne assignments, to Griswold Dental Bridge Company, Denver, Colo., a Corporation of Colorado. Filed July 28, 1900. Serial No. 28,171. (No model.)

Claim.—1. The combination with an impression-cup, of a pressure-rod, one end of the rod adapted to engage a saddle and the other end adapted to rest upon the opposite jaw to force the saddle into the tissues of the mouth by the action of the jaw in biting.

2. The combination with an impression-cup, of an adjustable pressure-rod playing through the cup, one end of the rod adapted to engage a saddle and the other end adapted to rest upon the opposite jaw to force the saddle into the tissues of the mouth by the action of the jaw in biting.

3. The combination with an impression-cup, of a combined pressure-rod playing through the cup for the purpose described.

702,646. DENTAL TOOL. WILLIAM E. GRISWOLD, Denver, Colo., assignor, by direct and mesne assignments, to Griswold Dental Bridge Company, Denver, Colo., a Corporation of Colorado. Filed July 28, 1900. Serial No. 28,172. (No model.)

Claim.—1. In a dental tool, the combination of a standard, a centering-post to rest upon a model, and an adjustable chuck or holder connected with the centering-post to carry tooth-scoring devices.

2. In a dental tool, the combination of a standard, an adjustable securing or centering post to rest upon a model, and an adjustable and removable chuck or holder for carrying spring-studs or cups for teeth.

3. In a dental tool, the combination of a standard, a centering-post, a swinging arm carried by the centering-post and vertically adjustable thereon, and a chuck carried by the swinging arm.

4. In a dental tool, the combination of a standard, a screw-threaded centering-post, a sleeve having a screw-threaded head working on the centering-post, a journal-sleeve turning on the first-named sleeve and bearing a horizontal arm, and an adjustable chuck carried by the arm, substantially as described.

702,647. FLOW ATTACHMENT. WILLIAM S. HALL, Graham, W. Va. Filed Aug. 21, 1901. Serial No. 72,531. (No model.)

Claim.—1. The combination with a plow-beam, and a plow carried thereby, of means for cutting vegetation located in advance of the plow-point with a space between the cutting means and the plow-point thereby to form an unobstructed passage through the vegetation for said plow-point.

2. The combination with a plow-beam having a plow, and a ground-wheel, of a vertically-reciprocating cutting apparatus hung from the beam and aligned in advance of the plow-point, with a space between the latter and the cutting apparatus and means for operating the cutting apparatus from the ground-wheel.

3. The combination with a plow-beam having a plow, and a ground-wheel, of a hanger hung from the beam and aligned in advance of the plow-point, a pendent fingered bar carried by the hanger and provided at its lower end with a forwardly-projected shoe having a downwardly-inclined sharpened front and portion extended in front of the bar, a vertically-reciprocating outer-bar mounted upon the hanger in rear of the shoe and cooperating with the fingers, there being an open space between the cutting apparatus and the plow-point, and means for working the outer-bar from the ground-wheel.

4. The combination with a plow-beam having a plow, and a ground-wheel, of a vertically-reciprocating cutting apparatus hung from the beam in front of the plow-point, with an open space between the latter and the cutting apparatus, a sprocket-wheel mounted upon the beam, another sprocket-wheel carried by the ground-wheel, a sprocket-chain connecting the two sprocket-wheels, a gear in operative relation to the first-named sprocket-wheel, a crank-disk driven from the gear, and a pinion connection between the disk and the cutting apparatus.

5. The combination with a plow-beam having a plow, and a ground-wheel, of a hanger hung from the standard and aligned in front of the plow-point, a forwardly-directed foot or shoe carried by the lower end of the hanger and located above the forward end of the plow-point, a reciprocating outer-bar mounted upon the hanger, a standard rising from the beam, a gear-wheel mounted upon the standard and in operative relation to the ground-wheel, a spindle carried by the upper end of the standard and projected at opposite sides thereof, a pinion carried by one end of the spindle and in mesh with the gear-wheel, a crank carried by the opposite end of the spindle, and a pinion connection between the crank and the cutting apparatus.

6. A plow attachment, comprising an upright hanger having means for connection with a plow-beam, and also provided with a forwardly-directed shoe at its lower end, forwardly-projected guard-fingers carried by the hanger, a vertically-reciprocating outer-bar mounted upon the hanger and in operative relation to the fingers, the cutting apparatus including the shoe being disposed for arrangement in front of the plow-point so as to have a clear space between the cutting apparatus and the plow, a standard having its foot provided with means for attachment to a plow-beam, a lower transverse spindle carried by the standard, an upper spindle carried by and projected at opposite sides of the standard, a drive-wheel mounted upon the lower spindle, means for operating the drive-wheel from the ground-wheel of a plow, a gear carried by the lower spindle, a pinion carried by one end of the upper spindle, a crank at the opposite end of said spindle, and a pinion connection between the crank and the outer-bar.

7. The combination with a plow-beam having a plow, of a vertically-reciprocating cutting apparatus hung from the beam and aligned in advance of the plow-point, with a clear space between the latter and the cutting apparatus and means for operating the cutting apparatus.

702,648. WIRE-STRETCHER. EDWARD M. HARR, Orient, S. D. Filed Aug. 12, 1901. Serial No. 72,151. (No model.)

Claim.—1. A wire-stretcher, comprising a lever having an intermediate fulcrum, long and short connecting-rods pivotally connected to the lever at opposite sides of the fulcrum and projected laterally at one side thereof, terminal clamps slidably carried by the outer ends of the respective connecting-rods, each clamp having a movable member which is connected to the outer end of the adjacent rod, and springs to normally hold the movable members in cooperative relation with the other members of the respective clamps.

2. A wire-stretcher having a connecting-rod, a wire-clamp comprising a body having a rear laterally-projected perforate ear slidably receiving the rod, and a forward laterally-projected jaw, a dog pivoted intermediate of its ends upon the body and in operative relation to the jaw, the rod being pivotally connected to the opposite end of the dog, a shoulder upon the rod and in rear of the clamp-body, and a helical spring co-

acting the rod and bearing in opposite directions against the shoulder and the rear end of the clamp-body.

3. A wire-stretcher, comprising a lever having an intermediate fulcrum, long and short connecting-rods pivotally connected to the lever at opposite sides of the fulcrum thereof and projected laterally at one side of the lever, terminal clamps slidably carried by the outer ends of the respective connecting-rods, each clamp having a movable member which is connected to the outer end of the adjacent rod, and springs carried by the rods and bearing in opposite directions against the latter and the rear ends of the respective clamps.

4. A wire-stretcher, comprising a wire-clamp having a laterally-projected jaw, which is provided at its outer end with an overhanging portion to form a wire-embracing guide or guard, the forward end of the guide or guard being outwardly flared to form an enlarged entrance-opening, a dog pivoted intermediate of its ends upon the jaw with its inner end working between the jaw and the overhanging portion thereof, and in cooperative relation with the back of said overhanging portion, and a connecting-rod slidably carrying the clamp and connected to the outer end of the dog.

5. A wire-stretcher comprising a lever, a chain or the like pivotally connected to an intermediate portion of the lever and forming a fulcrum-support therefor, a terminal wire-clamp carried by the free end of the chain, a comparatively short rod pivotally connected to the lever at one side of the fulcrum, a longer rod pivotally connected to the lever at the opposite side of the fulcrum thereof, said rods being projected at the same side of the lever, wire-clamps carried by the outer free ends of the rods, each clamp comprising a relatively fixed body slidably receiving the adjacent rod and provided with a laterally-projected jaw, and an intermediate-pivoted dog in cooperative relation to the jaw, the outer end of the rod being pivotally connected to the opposite end of the dog, dog-shoulders carried by the rods, and helical springs embracing the rods and bearing in opposite directions against the shoulders thereof and the rear ends of the respective clamps.

702,649. ILLUMINATOR. WILLIAM HARVEY, New York, N. Y. Filed Apr. 26, 1901. Serial No. 66,948. (No model.)

Claim.—1. In an illuminator, the combination with a cabinet adapted to carry colored slides, of a vertically-adjustable reflector located in said cabinet, and a revolvable member also mounted in said cabinet for adjustment with reference to said reflector and carrying a source of light, said source of light being adjustable upon said frame and with respect to the reflector.

2. An illuminator comprising a cabinet having three closed sides, one of said sides provided with a door, and an open front provided at top and bottom with ways adapted to receive interchangeable colored-glass slides; an adjustable reflector mounted at the rear of said cabinet; and a revolvable light-carrying frame slidably mounted in said cabinet in front of said reflector and in rear of said slides.

3. An illuminator comprising a cabinet having three sides closed, one of said sides provided with an operating-aperture; an open front provided with ways at the top and bottom adapted to receive interchangeable colored-glass slides; a vertically-adjustable reflector mounted in the rear of said cabinet; an adjustable carrying means therein in front of the reflector; and means whereby a light may be emitted, carried thereby.

4. In an illuminator, the combination with supporting means, of a reflector carried thereby; a light-carrying frame also carried thereby and adjustable toward and from said reflector, one part of said frame having a rotary adjustment relative to another part thereof, and one part of said frame carrying means whereby a light may be emitted, and having an adjustment in a plane transverse to the plane of the axis of said rotary adjustment.

5. In an illuminator, the combination with supporting means, of an adjustable reflector carried thereby; a light-carrying frame also carried thereby and adjustable toward and from said reflector, one part of said frame having a rotary adjustment relative to another part thereof, and one part of said frame carrying means whereby a light may be emitted, and having an adjustment in a plane transverse to the plane of the axis of said rotary adjustment.

6. In an illuminator, the combination with supporting means, of an adjustable reflector carried thereby; means whereby a light may be emitted; a frame effective to support said light-emitting means, said frame having a rotary adjustment relative to the reflector; one part of said frame having a rotary adjustment relative to another part thereof, and one part of said frame having an adjustment in a plane transverse to the plane of the axis of the rotary adjustment of said part of said frame.

7. In an illuminator, the combination with a cabinet adapted to support colored slides, of a reflector located within said cabinet, a revolvable frame also mounted in said cabinet and movable toward and from said reflector; and means whereby a light may be emitted adjustable upon said frame.

8. In an illuminator, the combination with a cabinet adapted to carry colored-glass slides and an adjustable sliding reflector carried therein, of a revolvable frame also carried in said cabinet and movable toward and from said reflector; and means whereby a light may be emitted adjustable upon said frame.

9. An illuminating device, comprising, in combination, a cabinet arranged to carry screens or slides; a reflector; a burner; and supporting means between said reflector and burner to provide a relative adjustment vertically, laterally, and to and fro between the reflector and the burner.

10. An illuminating device comprising, in combination, a cabinet arranged to carry glass screens or slides; a reflector; a burner; and means for supporting said burner; said supporting means being so constructed as to enable an adjustment of said burner toward and from said reflector and also from side to side.

11. An illuminating device comprising, in combination, a cabinet arranged to carry glass screens or slides; a reflector; a burner; means for supporting said burner; said supporting means so constructed as to enable an adjustment of said burner toward and from said reflector and also from side to side; and means for supporting said reflector so constructed as to enable a vertical adjustment of the latter.

702,650. FOLDING BASKET OR BUCKET. ROBERT E. HARRIS, Lub. Minn. Filed Oct. 21, 1901. Serial No. 79,464. (No model.)

Claim.—1. The combination, with a foldable receptacle, of the levers pivoted to the top and bottom of the receptacle and terminating in ears pivoted together and in flanges struck from the ears at right angles thereto and to the levers, so that the ears do not engage the flanges, and the latter engage each other only when the levers are in extended position.

2. The combination, with a foldable basket or bucket, of the upper and lower levers having ears and pivoted together in pairs and to the bottom and top of the basket or bucket, an internal flange or heel from the ears of the upper levers, and an outwardly-turned flange or heel from the ears of the lower levers, one pair of said levers adapted to open and close in a direction opposite to that of the other pair of levers, without the ears engaging the flanges.

3. The combination, with a foldable basket or bucket having bottom legs, of the upper and lower levers having ears and pivoted together in

pairs and to the top and bottom of the basket or bucket, and flanges at right angles to the ends of the levers at their central pivot-point, one pair of levers opening and closing in a direction opposite to that of the other pair, and the bottom levers engaging said legs to assist the said flanges in holding the levers in rigid upright position.

702,651. BULKHEAD-DOOR. WALTER W. IVE, Buffalo, N. Y. Filed May 28, 1901. Serial No. 61,948. (No model.)

Claim.—1. In a bulkhead-doorway, in combination, a pair of similar, intercommunicated doors positioned at substantially a right angle with each other and both hinged to the same door-jamb, a concave camment upon the opposite jamb within which the free edges of said doors caulk and closely fit, and sealing device, the bulkhead co-operating with either door when in closed position.

2. In a bulkhead-doorway, a pair of similar doors independently hinged to one jamb and connected at right angles to each other, a cylindrical camment for the free edge of each door, and sealing device for the door edges.

3. In a bulkhead-doorway, in combination a pair of intercommunicated doors substantially at right angles with each other, a cylindrical camment for each door, an intermediate stop for both doors, and sealing device for the door edges, as and for the purposes set forth.

4. In a bulkhead, a pair of doors, hinged to the same jamb on opposite sides of the bulkhead and intercommunicated so as to be maintained at substantially right angles with each other, a cylindrical camment for each door, adjusted closely to its arc of movement, and means whereby the joints around each door are sealed when the door is closed against the edges of the doorway.

5. In a bulkhead-doorway, in combination, a pair of angularly-disposed doors hinged at their adjacent edges to one door-jamb and arranged one on each side of the bulkhead, and a concave camment upon the opposite jamb within which the doors closely fit, said doors being larger than the doorway-opening, substantially as and for the purposes specified.

6. In a bulkhead-doorway, in combination, a pair of doors each larger than the opening arranged on opposite sides of the bulkhead at an angle with each other and hinged to the same jamb, a concave camment upon the opposite jamb to receive the free edges of the doors, and sealing device between the faces of the doors and the edges of the doorway.

7. In a bulkhead-doorway, in combination, the pair of intercommunicated doors positioned substantially at right angles to each other and hinged to the same jamb, the concave camment upon the opposite jamb, the steps intermediate of said doors in the plane of the bulkhead, and the devices between said doors and said steps serving when either door is brought into contact therewith to seal the doorway-opening.

8. In combination with a bulkhead-doorway, a pair of angularly-disposed doors hinged to one door-jamb and caulked within concave camments upon the opposite jamb, a jointed intercommunicating brace for said doors, and means for gripping the doors against the opposite faces of the door-jamb to seal the joints between the same.

9. A bulkhead-doorway having sealing device upon both faces, a concave camment upon one door-jamb, a pair of doors hinged to the opposite jamb, a collapsible detachable brace intercommunicating the doors and normally holding them at substantially right angles with each other, and means when said doors are folded together for gripping them against said sealing device.

10. In a structure of the class described, a pair of oppositely-disposed doors adapted to be closed against opposite sides of the door-ways, each door being caulked or caulked outwardly but with plane-convex margins along all its edges.

11. In combination with a bulkhead-doorway, a pair of outwardly-

convexed doors, one on each side of the doorway and hinged to the same jamb, devices for sealing the joints between the edges of the doors and the casing of the doorway, and means for gripping the doors upon the sealing device.

12. In an organism of the character described, having a pair of intercommunicated, caulked doors, a still for each door adjusted to lift the same as it turns outwardly, as and for the purposes set forth.

13. In a structure of the class described, a pair of doors hinged to the same jamb and swinging on opposite sides of the bulkheads and adapted each to be closed against the casings of the doorway, each door being centrally convexed outwardly, but with margins plane-convexed, and sealing attachments upon the door casings or jambs with which the door-margins contact when closed.

14. In combination with a pair of doors as described, gravity-closing devices for both doors, consisting of stops or levers having a water-soluble support, and a cushion connecting said support with the compartment on the opposite side of the bulkhead, as and for the purposes set forth.

15. In a structure of the class described, a door-jamb comprising the bulkhead-chest, the casing-strip upon the edge of the chest, the marginal strip on each side of the chest slightly spaced from the casing-strip and cushion-strips in the channels between the marginal and casing strips substantially as and for the purposes specified.

702,652. MECHANICAL MOVEMENT. BARRY IVES, Chicago, Ill., assignor to Charles M. Rogers and Louis G. Rolfe, Chicago, Ill. Filed Feb. 2, 1901. Renewed Dec. 2, 1901. Serial No. 64,464. (No model.)

Claim.—1. In a mechanical movement, the combination with a support, of a rotatable shaft journaled thereon, a ratchet-wheel fixed on said shaft, a disk loosely mounted on the shaft and provided with a segmental slot, a spring-actuated pawl pivoted to the face of the disk adjacent to the ratchet-wheel and engaging the teeth thereof, an arm or lever secured to the periphery of the disk, a pivot passing through the slot of the disk and into the support, and a spring-actuated pawl secured on said pivot, substantially as described.

2. In a mechanical movement, the combination with a rotatable shaft suitably journaled, of a ratchet-wheel fixed on said shaft, a disk loosely mounted on the shaft and provided with a segmental slot and having a peripheral flange surrounding the ratchet-wheel, a spring-actuated pawl pivoted to the face of the disk adjacent to the ratchet-wheel, and engaging the teeth thereof, an arm or lever secured to the disk, means to move said arm back and forth, a pivot passing through the slot of the disk and a spring-actuated pawl secured on said pivot and engaging the teeth of the ratchet-wheel, substantially as described.

3. The combination with a shaft suitably journaled, a disk mounted thereon, an arm secured to the disk and provided with a longitudinal slot, of an engine having a reciprocating piston-rod, a link movably secured in the slot of the arm and having a dot parallel thereto, and a pin in said dot pivotally uniting the piston-rod and link, substantially as described.

702,653. SAND PUMP AND RAILER. FREDERICK W. JACOBSON, Chicago, Ill. Filed July 10, 1901. Serial No. 67,738. (No model.)

Claim.—1. In a pump, the combination with a pump stock or tube, and a fixed reinforce or lining mounted within the lower end thereof, of a valve seat or casing mounted within the lower end of the reinforce said valve-seat being supported by the reinforce and detachably connected therewith by interlocking means, substantially as described.

2. In a pump, the combination with a pump stock or tube, and a reinforce or lining inserted in the lower end thereof and provided with a bayonet-socket covered exteriorly by the pump-tube, of a valve-seat removably mounted within said reinforce or lining and provided with a key

to engage the bayonet-socket, and means for preventing relative movement between the reinforce and valve-seat.

3. In a pump, the combination with a pump stock or tube, and a reinforce or lining fixed within the lower end thereof and provided with a bayonet-socket exteriorly covered by the pump-tube, of a valve-seat or casing removably mounted in the lower end of the pump-stock and provided with a key to engage the bayonet-socket, and a spring-pressed locking-pin engaging openings in the pump-stock and valve-casing and serving to prevent disengagement between the key and socket.

4. In a pump, the combination with a pump stock or tube, and a reinforce or lining inserted in the lower end thereof and provided with a bayonet-socket covered exteriorly by the pump-tube, of a valve-seat removably mounted within said reinforce or lining and provided with a key to engage the bayonet-socket.

702,654. WARP STOP-MOTION FOR LOOMS. EMERY J. JARRY, Worcester, Mass., assignor to Crompton & Knowles Loom Works, Worcester, Mass., a Corporation of Massachusetts. Filed Dec. 9, 1901. Serial No. 84,317. (No model.)

Claim.—1. In a loom, the combination of a loom-thread-supporting beam, needles for introducing the loom-threads, drop devices supported by the loom-threads between the loom-beam and loom-needles, means interposed between the loom-needles and drop devices for maintaining a normal condition of the loom-threads as they pass through the drop devices, and electrically-controlled stop devices operative on the dropping of a drop device to stop the loom.

2. In a loom, the combination of a loom-thread-supporting beam, needles for introducing the loom-threads, drop devices supported by the loom-threads between the loom-beam and loom-needles, guides and tension mechanism for the loom-threads disposed between the loom-needles and drop devices for maintaining a normal condition of the loom-threads as they pass through the drop devices, and electrically-controlled stop devices operative on the dropping of a drop device to stop the loom.

3. In a loom, the combination of a loom-thread-supporting beam, loom-needles for introducing the loom-threads, means for maintaining the loom-threads in normal condition as they pass through the drop wires or bars, said an electric stop-motion for the loom-threads, consisting of a series of drop wires or bars supported on the loom-threads, and extending in a plane above the plane of the ordinary warp-threads, a clasp guide-bar for the drop wires or bars, and a second clasp-bar to be engaged by the drop wires or bars in their lowered position, to complete the electric circuit and put into operation mechanism for stopping the loom, substantially as shown and described.

4. In a loom, the combination of a loom-thread-supporting beam, a key, loom-needles for introducing the loom-threads, and an electric stop-motion for the loom-threads, consisting of a series of drop wires or bars supported

on the lappet-threads, and extending in a plane above the plane of the ordinary warp-threads, a bar extending over the drop wires or bars, a circuit guide-bar for the drop wires or bars, and a second circuit-bar to be engaged by the drop wires or bars in their lowered position, to complete the electric circuit and put into operation mechanism for stopping the loom, and guides for the lappet-threads to lead the said threads direct from the stop-motion to the lappet-needles, and means interposed between the lappet-needles and drop wires or bars for maintaining the lappet-threads in normal condition as they pass through said drop wires or bars, substantially as shown and described.

5. In a lappet-loom, the combination with lappet-thread beam and lappet-needles, two supporting-rods for the lappet-threads, of a series of drop wires or bars hung on the lappet-threads, between said two supporting-rods, and extending in a plane above the ordinary warp-threads, and a circuit guide-bar for the drop wires or bars, and a second circuit-bar to be engaged by the drop wires or bars in their lowered position, said circuit-bar provided with binding-posts, and in electric connection with an electromagnet, and an armature, and a trigger-support, which is operated on the closing of the circuit by the dropping of a wire or bar, to allow the trigger to drop, and cause the trigger-lever, through intermediate mechanism, to operate to stop the loom, and a tension mechanism for the lappet-threads disposed between the needles and the drop device, substantially as shown and described.

702,655. MEANS FOR TRANSMITTING POWER FROM CAR-AXLES. BENJ. H. JOHNSON, Lafayette, Ill. Filed Mar. 27, 1901. Serial No. 58,587. (No model.)

Claim.—1. A means for transmitting power from car-axles, comprising a gear mounted upon the axle, a counter-shaft arranged parallel to the axle, a gear-casing adapted to be clamped about the car-axle to inclose the gear thereon and the counter-shaft, gears arranged within said casing and connected to the counter-shaft and clutch mechanism whereby rotary motion of the car-axle in either direction may be transmitted through said gears in the same direction to a power-using device, substantially as described.

2. In means for transmitting power from car-axles, the combination with a gear mounted upon the axle, a counter-shaft, a gear fixed thereon and connected with the axle-gear, gear-wheels loosely mounted upon the counter-shaft, a power-transmitting shaft geared with said loose gears, and clutch mechanism whereby either of the loose gears may be made fast with the counter-shaft whereby rotary motion in the same direction may be imparted to the power-transmitting shaft when the axle and counter-shaft are rotated in either direction, substantially as described.

3. In means for transmitting power from car-axles, the combination with the axle of a sleeve secured thereon, a gear-wheel secured with the sleeve, a counter-shaft arranged parallel to the axle, gear-wheels loosely mounted thereon and being each other, a gear fixed to the counter-shaft and connected with the axle-gear, a clutch mechanism adapted to connect either of the loose gears with the fixed gear, and a shaft adapted to be driven in the same direction by either of the loose gears when secured to turn with the counter-shaft, substantially as described.

4. Means for transmitting power from car-axles, comprising, a sleeve adapted to embrace a car-axle and having a gear member thereon, means for fixedly securing the sleeve to the axle and a casing loosely mounted on and surrounding the sleeve, gearing journaled in and carried by the casing meshing with the gear member on the sleeve, and means for securing the casing on the sleeve.

702,656. BLOCK-SIGNAL SYSTEM. PIERRE O. KNEBELER, Baltimore, Md. Filed Mar. 6, 1902. Serial No. 94,970. (No model.)

Claim.—1. A railway signal system, comprising a track divided into a series of sections or blocks, one or more track-coils in each block, a source of electric current for the track-coils of each block, a source of electric current connected to the opposite rails of each block, and means whereby the electrical condition of the rail-circuit of one block controls the current to the track-coils of the following block, as set forth.

2. A railway signal system, comprising a track divided into a series of sections or blocks, one or more track-coils in each block, a source of electric current for the track-coils of each block, a source of electric current connected to the rails near the end of each block, an electromagnet connected to the rails near the other end of each block, an armature in position to be actuated by said electromagnet, and contacts carried by said armature and arranged to control the current to the track-coils of each successive block, as set forth.

3. A railway signal system, comprising a track divided into a series of sections or blocks, one or more track-coils in each block, a source of electric current for the track-coils of each block, a source of electric current connected to the rails near the end of each block, an electromagnet connected to the rails near the other end of each block, an armature in position to be actuated by said electromagnet, and sets of contacts carried by said armature, so arranged that the movement of said armature in either direction reverses the current through the track-coils of each successive block, as set forth.

4. A railway signal system, comprising a track divided into a series of sections or blocks, one or more track-coils in each block, a source of electric current for the track-coils of each block, a source of electric current connected to the opposite rails of each block, means whereby the electrical condition of the rail-circuit of one block controls the current to the track-coils of the following block, a train-coil in each position that movement over a track-coil generates an induced current therein, and a signaling device on the train and in circuit with said train-coil, as set forth.

5. A railway signal system, comprising a track divided into a series of sections or blocks, one or more track-coils in each block, a source of electric current for the track-coils of each block, a source of electric current connected to the rails near the end of each block, an electromagnet connected to the rails near the other end of each block, an armature in position to be actuated by said electromagnet, contacts carried by said armature and arranged to control the current to the track-coils of each successive block, a train-coil in each position that movement over a track-coil generates an induced current therein, and a signaling device on the train and in circuit with said train-coil, as set forth.

6. A railway signal system, comprising a track divided into a series of sections or blocks, one or more track-coils in each block, a source of electric current for the track-coils of each block, a source of electric current connected to the rails near the end of each block, an electromagnet connected to the rails near the other end of each block, an armature in position to be actuated by said electromagnet, sets of contacts carried by said armature, so arranged that the movement of said armature in either direction reverses the current through the track-coils of each successive block, a train-coil in each position that movement over a track-coil generates an induced current therein, and a signaling device on the train and in circuit with said train-coil, as set forth.

7. A train having a coil in proximity to the track, and a signaling device in circuit with said coil and comprising a movable member and electromagnet mechanism constructed to move said member in either direction, according to the direction of flow of current through said coil, as set forth.

8. A train having a coil in proximity to the track, and a signaling device in circuit with said coil and comprising a movable member, separate indicators behind said member, and electromagnet mechanism for shifting said member and moving said indicator according to the direction of flow of current through said coil, as set forth.

702,657. SPEED-REGULATING MEANS FOR ELECTRIC MOTORS. BENJAMIN G. LAMER, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Co., a Corporation of Pennsylvania. Filed Apr. 24, 1901. Serial No. 58,587. (No model.)

Claim.—1. The combination with a source of direct-current electromotive force, of a direct-current motor driven by energy from said source and having a separately-excited field-magnet, a generator having a self-excited and normally unexcited field-magnet and driven by said motor for supplying current to the motor-field-magnet winding.

2. The combination with an electric motor driven from a source of variable electromotive force, of a generator having a self-excited and normally unexcited field-magnet and driven by the motor to supply its field-magnet winding with exciting current.

3. The combination with an electric motor driven from a source of variable electromotive force, of an exciting-generator for the field-magnet of the motor having a self-excited and normally unexcited field-magnet and having its armature mechanically connected to the motor-armature.

4. The combination with an electric motor driven from a source of variable electromotive force, of an exciting-generator therefor having a self-excited and normally unexcited field-magnet and driven by said motor, whereby the motor is operated at approximately constant speed.

5. The combination with an electric motor driven from a source of variable electromotive force, of an exciting-generator therefor having a self-excited and normally unexcited field-magnet and having its armature coupled to that of the motor, whereby the field of the motor is adjusted to maintain an approximately constant speed.

702,658. DYNAMO-ELECTRIC GENERATOR. BENJAMIN G. LAMER, Pittsburgh, Pa., assignor to Westinghouse Electric & Manufacturing Company, a Corporation of Pennsylvania. Filed Sept. 24, 1901. Serial No. 73,578. (No model.)

Claim.—1. In an electrical machine, a rotatable member comprising a core and an insulated winding completely embedded therein.

2. In an electrical machine, a rotatable member comprising a cylindrical core and an insulated winding completely embedded therein.

3. In an electrical machine, a rotatable member comprising a cylindrical, sectional core and an insulated winding completely embedded therein.

4. In an electrical machine, a rotatable member comprising a slotted core formed of cylindrical sections fastened together by dovetail-pieces and an insulated winding located in the core-slots and beneath the core-surface.

5. In an electrical machine, a rotatable member comprising a cylindrical core having communicating longitudinal and transverse ventilating-passages and an insulated winding completely embedded in the core.

6. In an electrical machine, a rotatable member comprising a core having deep, narrow slots extending entirely around it and an insulated winding each turn of which occupies the entire width of a slot.

7. In an electrical machine, a rotatable member comprising a core having slots extending entirely around it and an insulated winding completely inclosed in said slots each turn of which occupies the width of its slot.

8. In an electrical machine, a rotatable member comprising a cylindrical core having a plurality of slots extending completely around it in planes parallel to the shaft and an insulated winding completely inclosed in said slots and having no side-by-side turns in any slot.

9. In an electrical machine, a rotatable member comprising a core formed of cylindrical sections of different internal diameters, an insulated winding completely embedded in said core and a shaft having a plurality of diameters corresponding to the internal diameters of the core-sections.

10. In an electrical machine, a rotatable member comprising a cylindrical core having a set of endless slots disposed in longitudinal planes, an insulated winding located in said slots and non-magnetic strips located in the outer portions of the slots and flush with the surface of the core.

11. In an electrical machine, a rotatable member comprising a core formed of cylindrical sections and having a set of endless slots disposed in longitudinal planes, an insulated winding located in said slots and non-magnetic metal locking-strips in the outer portions of said slots and flush with the surface of the core.

702,659. HOE. EDWIN C. LAMER, Detroit, Mich. Filed Dec. 22, 1901. Serial No. 94,984. (No model.)

Claim.—1. The combination of a handle having a longitudinally-divided lower end, forming two yielding scouring-arms, two hoe-blades arranged side by side, rigid attaching-chunks rising from the inner sides of said blades and secured to said arms, and an adjusting device connecting said chunks below said yielding scouring-arms for holding said yielding scouring-arms spaced apart more or less, substantially as set forth.

2. The combination of a handle having a longitudinally-divided lower end, forming two yielding scouring-arms, two hoe-blades arranged side by side, rigid attaching-chunks rising from the inner ends of said blades and provided at their upper ends with half-sockets, means for securing said half-sockets to said arms, and a transverse adjusting-screw connecting said chunks below said arms for holding said yielding scouring-arms spaced apart more or less, substantially as set forth.

3. The combination of a handle having a longitudinally-divided lower end, forming two yielding scouring-arms, two hoe-blades arranged side by side, attaching-chunks rising from the inner ends of the hoe-blades and provided at their upper ends with socket-plates which are arranged against the outer sides of said arms, screw-plates arranged against the in-

the sides of said arms, and fastening-screws inserted through said socket-plates and arms into said screw-plates, substantially as set forth.

4. The combination of a handle having a longitudinally-divided lower end, forming two yielding scoring-arms which are provided on their inner sides with longitudinal grooves, two hoe-blades arranged side by side, attaching-chunks rising from the inner ends of the hoe-blades and provided at their upper ends with socket-plates which are arranged against the outer sides of said arms, screw-plates arranged in the grooves on the inner sides of said arms, and fastening-screws inserted through said socket-plates and arms into said screw-plates, substantially as set forth.

5. The combination of a handle, attaching-chunks secured to said handle and adjustable toward and from each other, and two substantially horizontal hoe-blades secured to said handle side by side and provided at their inner ends with upright blades extending the inner or opposing faces of which converge forwardly in all positions of the handle, substantially as set forth.

6. The combination of a handle having a longitudinally-divided lower end, forming two yielding scoring-arms, two substantially horizontal hoe-blades arranged side by side and provided at their inner ends with upright blades extending the inner or opposing faces of which converge forwardly, attaching-chunks rising from said blades extensions and secured to said arms, and an adjusting device connecting said handle below said arms, substantially as set forth.

702,660. PROCESS OF MAKING INSULATORS. FRED M. LORER, Victor, N. Y. Filed Mar. 12, 1902. Serial No. 97,572. (No specification.)

Claim.—The process herein described of constructing insulators formed of two or more shells of suitable insulating material consisting in forming it in two or more parts, dipping them in liquid glass, the outer shells being dipped bottom side upward and allowing a portion of the liquid glass to remain in the outer shell or shells, nesting them together in this position with their petticoats uppermost and then firing them so as to fuse the parts together so as to form practically but a single piece.

702,661. INSULATOR AND PROCESS OF MANUFACTURING SAME. FRED M. LORER, Victor, N. Y. Filed Apr. 19, 1902. Serial No. 102,722. (No specification.)

Claim.—1. The herein-described process of securing together two or more shells or parts of an insulator consisting in first firing the shells or parts in a kiln, then nesting them together and pouring in liquid glass or glass or similar material in its molten or semimolten state and then allowing the parts to cool.

2. The herein-described method of forming an insulator consisting in first molding the parts separately, firing them in a kiln, then pouring in liquid glass or glass or similar material in its molten or semimolten state and inserting the inner shell into the outer shell and allowing the parts to cool.

3. The herein-described method of constructing an insulator consisting in first molding the parts separately, then applying liquid glass, glass or similar material in the molten or semimolten state between the joints and allowing the parts to cool.

702,662. CONDUIT FOR ELECTRIC WIRES OR CABLES. ROBERT W. LYLE, Perth Amboy, N. J. Filed Apr. 10, 1902. Serial No. 102,109. (No model.)

Claim.—1. A conduit-section having a longitudinal external groove, the end wall of which is undercut.

2. A conduit-section having a longitudinal external groove, the end wall of which is beveled inward.

3. A conduit-section having a longitudinal external groove opening

into one end thereof, the closed end wall of the groove being undercut, and a key having an end shaped to fit in said undercut end wall.

4. A conduit the sections of which have registering external grooves the end walls of which are undercut, and a key fitted in each groove; the ends of the key being shaped to enter the undercut end walls of the grooves.

5. A conduit the sections of which have registering external grooves the end walls of which are beveled, and a key fitted in each groove and bridging the abutting ends of the sections, the opposite ends of the key being beveled to fit under the beveled end walls of the grooves.

702,663. CONDUIT FOR ELECTRIC WIRES OR CABLES. ROBERT W. LYLE, Perth Amboy, N. J. Filed Apr. 10, 1902. Serial No. 102,170. (No model.)

Claim.—1. The combination with a series of tiles arranged end to end, each tile having external grooves at its opposite ends, of clips embracing the outer faces of abutting tiles and having portions thereof entering said grooves to center and lock the tiles in alignment.

2. A conduit comprising a series of tiles arranged end to end, and clips embracing the corners of said tiles at the abutting ends thereof.

3. A conduit comprising a series of tiles arranged end to end, and spring-clips embracing the corners of said tiles at the abutting ends thereof.

4. A conduit comprising a series of tiles arranged end to end, and metallic clips embracing the corners of said tiles at the abutting ends thereof, said clips covering the joints between adjacent tiles.

5. The combination with a series of tiles arranged end to end, each tile having external grooves at its opposite ends, of angular clips embracing the corners of abutting tiles and having portions thereof entering said grooves to center and lock the tiles in alignment.

6. The combination with a series of tiles arranged end to end, each tile having external grooves at its opposite ends, of angular clips embracing the corners of abutting tiles and having flanges that enter said grooves to center and lock the tiles in alignment.

7. The combination with a series of tiles arranged end to end to form a conduit, each tile having external grooves at its opposite ends, of angular clips embracing the corners of abutting tiles and having flanges that enter said grooves, and a covering of flexible material surrounding the abutting ends of the tiles and including said clips.

8. As a new article of manufacture, a corner-clip comprising integral spring-arms normally arranged at an angle to each other less than a right angle, said arms being provided with inwardly-projecting portions.

9. As a new article of manufacture, a corner-clip comprising a strip of spring metal bent intermediate its ends to provide two resilient arms that are normally disposed at an angle to each other less than a right angle, said arms being provided with inwardly-projecting portions.

10. As a new article of manufacture, a corner-clip comprising a strip of resilient material bent intermediate its ends to provide two spring-arms that are normally disposed at an angle to each other less than a right angle, said arms being provided with inwardly-projecting portions.

11. As a new article of manufacture, a corner-clip comprising a strip of spring metal bent intermediate its ends to provide two resilient arms that are normally disposed at an angle to each other less than a right angle, the ends of said arms being flanged inward toward each other.

702,664. PROJECTILE. AXEL W. MATTHEW, Oakley, Mass. Filed Nov. 20, 1901. Serial No. 92,008. (No model.)

Claim.—1. A projectile comprising a firing-head, a stem projecting from the firing-head, and formed with radially-extending legs, arranged

at intervals, and a point carried by the inner end of the stem, and a charge of powder surrounding the stem and having the legs embedded therein.

2. A projectile comprising a firing-head, a cylinder carrying a charge of rapid-burning powder and projecting from the firing-head, and formed with radially-extending legs arranged at intervals, and a point carried by the inner end of the cylinder, and a charge of smokeless powder surrounding the cylinder and having the legs embedded therein.

3. A projectile comprising a firing-head provided with an annular flange and a channelled collar, a cylinder carrying a charge of rapid-burning powder, and perforated at intervals throughout its entire length, and formed with radially-extending legs arranged at intervals, one end of said cylinder being open and detachably secured in the channel of said collar, and a point carried by the inner end of said cylinder, and a charge of smokeless powder surrounding the cylinder and having the legs embedded therein.

4. A projectile comprising a firing-head provided with an annular flange and a channelled collar, a cylinder carrying a charge of rapid-burning powder, and perforated at intervals throughout its entire length, and formed with radially-extending legs arranged at intervals, one end of said cylinder being closed and solid for a portion of its length, and the opposite end thereof open and detachably secured in the channel of said collar, a point having a reduced portion and a central recess to receive the solid portion of said cylinder, and a charge of smokeless powder surrounding the cylinder and reduced portion of the point, and having the legs embedded therein.

702,665. SNOW-FASTENERS. ALBERT C. REAR, Medford, Mass., assignor of one-half to Charles J. Addy and John T. Higgins, Medford, Mass. Filed Feb. 2, 1902. Serial No. 92,492. (No model.)

Claim.—1. In a fastening of the class described, a slotted plate having longitudinal grooves and adapted to be connected at one end with part of a shoe, and a complementary device comprising a body having internal portions to enter said grooves and having a projecting tongue to enter one of said slots, the device thereafter being capable of being turned on the slotted plate to cause the extremities of the tongue to enter the slot and confine the device on the face of the plate.

2. In a fastening of the class described, a slotted plate adapted to be connected with a part of a shoe, and a complementary device having a rigidly-connected tongue extending outwardly therefrom toward the point of attachment of said complementary device, the tongue being adapted to enter one of the slots of the plate and the complementary device as a whole being thereafter turned about the engaging portion of the tongue and plate as a fulcrum to complete the locking of said fastening, the tongue and complementary device being extended inward and brought together to form an operating hand portion.

3. In a fastening of the class described, a slotted plate adapted to be connected with a part of a shoe, and a complementary device having a rigidly-connected tongue projecting from the outer end of the device, and provided with a slot at the portion of the device adjacent the free end of the tongue for connection with a part of a shoe, said tongue being offset between its ends, the tongue being adapted to enter one of the slots of the plate, the device being thereafter turned on the body of the plate as a lever to complete the locking of the device on the plate, said tongue and complementary device being extended inwardly and brought together to form an operating hand portion.

4. In a fastening of the class described, a slotted plate adapted to be connected to one part of a shoe, and a complementary device having an integrally-formed tongue extending toward the point of attachment of the complementary device, said tongue being offset or inclined in the direction of its length from the under side of said complementary device, the free end of the tongue projecting beyond the outer end of said complementary device, said tongue and complementary device being extended inwardly and brought together at the portions thereof remote from the free end of the tongue to form an operating hand portion.

5. A fastening of the class described comprising a slotted plate for attachment to a part of a shoe, a complementary device having a rigidly-connected tongue for engagement with the slotted plate, the side edges of said device on opposite sides of the tongue being downturned to bear upon the opposed edges of the plate when the parts are in locking position.

702,666. ELECTRIC CLOCK-SYNCHRONIZER. CHARLES F. REAR, Medford, Mass. Filed May 19, 1901. Serial No. 90,591. (No model.)

Claim.—1. In a device of the kind described, the combination with the sounder, an electro-magnet arranged in connection therewith, an armature arranged in connection with the said magnet, an arm carrying the said armature, a lever mechanism for releasing the said arm, the elbow-lever for checking the motion of a pendulum, the electro-magnetic means for releasing the said lever, the line connecting the said electro-magnetic device, and the sounder, the swinging arm carrying a contact-point adapted to close the circuit, substantially as set forth.

2. The combination with a sounder, of an upright arm carrying a lever at its upper end and a lever intermediate its end, and a third lever adapted to hold the other levers in position, a pivoted arm carrying an armature, and a contact-point, the line-wire and circuit-closer, the electro-magnet and its armature, the rotating wheel carrying the arm and pin, and the elbow-lever adapted to rest upon the pin, and the bell and striking mechanism, all arranged and adapted to operate, substantially as described.

702,667. DRESS-SHIELD. JOHN F. MURPHY, Adrian, Mich. Filed Sept. 26, 1901. Serial No. 79,599. (No model.)

Claim.—1. A dress-shield, having a continuous arcuate holder and spreader fitted in the right thereof, and connected thereto, and an attaching-clamp carried by the intermediate portion of the holder and embodying a clip to straddle an arm-axle, and a pivotal jaw carried by one side of the clip and to clamp against the opposite side thereof.

2. A dress-shield, having an arcuate continuous spreader and holder fitted in the right thereof, and provided with an intermediate substantially U-shaped clip embracing and fixed to the holder, and a clamping-jaw pivoted intermediate of its ends to one side of the clip and to cooperate with the other side thereof, the outer free end of the jaw being connected to the adjacent section of the shield.

3. A holder and spreader for dress-shields, comprising a continuous arcuate body having opposite terminal eyes, and an intermediate inverted substantially U-shaped clip embracing the body and projected at one end of the clip, the inner end of the jaw being provided with teeth and ly-

leg between the sides of the clip to cooperate with the opposite side thereof, and the outer free end of the jaw being constructed for connection with one section of a drum-chill.

4. A drum-chill holder and spreader, comprising a continuous arcuate rod-like body having a portion twisted into a spring-coil located in the longitudinal axis thereof to give flexibility to the device, and an arm-engage-clip carried by the spreader and projected at the convex side thereof.

5. A drum-chill holder and spreader, comprising an arcuate rod-like body having portions twisted into spring-coils located at opposite sides of the middle of the device and in the longitudinal axis thereof, and an arm-engage-clip carried by the device between the opposite spring-coils and projected at the convex side of the spreader.

702,668. SEAM FOR SEWED ARTICLES. CHERRY HENRI, Chicago, Ill., assignor to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed Apr. 5, 1900. Serial No. 711,810. (No model.)

Claim.—1. The herein-described seam, comprising a fabric with an inwardly-turned hem-fold thereon, a second fabric with an oppositely-turned hem-fold superposed upon the other hem-fold, and a row of loops uniting the two hem-folds and entering and emerging at adjacent points on the face of the same hem-fold; substantially as described.

2. The herein-described seam, comprising a fabric with an inwardly-turned hem-fold thereon, a second fabric with an oppositely-turned hem-fold superposed upon the other hem-fold and a row of loops uniting the two hem-folds and entering and emerging at adjacent points on the face of the same hem-fold, and cooperating locking-threads for the loops; substantially as described.

702,669. SOUND-STRENGTHENING APPLIANCE FOR TELEPHONE-STATIONS. FRANK ORENBURG, Vienna, Austria-Hungary, assignor to Louis Rider, Vienna, Austria-Hungary. Filed Apr. 29, 1901. Serial No. 58,064. (No model.)

Claim.—1. In a telephone-station, the combination with the inductorium of a soft-iron core inserted into the same, a soft-iron armature so mounted in front of the pole of the said core as to be enabled to oscillate under the action of the variations of the magnetic force, a magnetizing coil or coils interposed in the circuit of a special current-generator and so surrounding the said armature as to cause an unlike pole or unlike poles to be formed in front of the pole or poles of the core, and a secondary coil or coils surrounding the said magnetizing-coils of the armature and connected in series with the secondary coil or coils of the inductorium, substantially as set forth and for the purpose described.

2. In a telephone-station, the combination with the inductorium of a soft-iron core inserted into the same, a soft-iron armature so mounted in front of the pole of the said core as to be enabled to oscillate under the action of the variations of the magnetic force, a magnetizing coil or coils interposed in the circuit of a special current-generator and so sur-

rounding the said armature as to cause an unlike pole or unlike poles to be formed in front of the pole or poles of the core, and a secondary coil or coils surrounding the said magnetizing-coils of the armature and connected in series with the secondary coil or coils of the inductorium, the bobbin or bobbins of the said inductorium being extended beyond the pole of the core, and the pole or poles of the armature projecting into the extended bobbin or bobbins of the inductorium, substantially as set forth and for the purpose described.

702,670. WATER-TUBE BOILER. OWEN D. OWEN, New York, N. Y. Filed Mar. 29, 1901. Renewed Feb. 29, 1902. Serial No. 95,890. (No model.)

Claim.—1. A water-tube boiler comprising two vertical drums placed at opposite ends of the furnace and each having a water and a steam space, horizontal headers extending laterally from the said drums and connected by longitudinal tubes, part of which form water-tubes and part form drying or superheating tubes, combined with a furnace having grates adapted to be fired from opposite sides of the front drum, and deflecting-walls over the first header extending transversely from the longitudinal walls of the furnace into proximity to the drums for directing the products of combustion inwardly between the drums, substantially as described.

2. A water-tube boiler comprising two vertical drums placed at opposite ends of the furnace and each having a water and a steam space, horizontal headers extending laterally from the said drums and connected by longitudinal tubes, part of which form water-tubes and part form drying or superheating tubes, longitudinal tubes directly connecting the two vertical drums, combined with a furnace having grates adapted to be fired from opposite sides of the front drum, and deflecting-walls over the first header extending from the walls of the furnace into proximity to the drums for directing the products of combustion inwardly between the drums, substantially as described.

3. A water-tube boiler comprising two vertical drums placed at opposite ends of the furnace and each having a water and a steam space, horizontal headers extending laterally from the said drums and connected by longitudinal tubes, part of which form water-tubes and part form drying or superheating tubes, longitudinal tubes directly connecting the two vertical drums, combined with a furnace having grates adapted to be fired from opposite sides of the front drum, deflecting-walls extending from the walls of the furnace into proximity to the drums for directing the products of combustion inwardly between the drums, and horizontal deflecting-plates located above the deflecting-walls for directing the products of combustion outwardly, substantially as described.

4. A water-tube boiler comprising two vertical drums placed at opposite ends of the furnace and each having a water and a steam space, horizontal headers extending laterally from the said drums and connected by longitudinal tubes, part of which form water-tubes and part form drying or superheating tubes, a combustion-chamber formed between the adjacent ends of the headers and containing longitudinal tubes connecting the two vertical drums, deflecting-walls arranged between the headers and extending from the walls of the furnace to the combustion-chamber, and deflecting-plates extending from the headers, substantially as described.

5. A water-tube boiler comprising two vertical drums placed at opposite ends of the furnace and each having a water and a steam space, horizontal headers extending laterally from the said drums and connected by longitudinal tubes, part of which form water-tubes and part form drying or superheating tubes, longitudinal tubes directly connecting the two vertical drums, combined with a furnace having grates on opposite sides of the drums, and deflecting-surfaces arranged at different levels for re-

spectively directing the products of combustion inwardly and outwardly with respect to the longitudinal tubes connecting the drums, substantially as described.

6. A water-tube boiler comprising two vertical drums placed at opposite ends of the furnace and each having a water and a steam space, horizontal headers extending laterally from the said drums and connected by longitudinal tubes, part of which form water-tubes and part form drying or superheating tubes, longitudinal tubes directly connecting the two vertical drums, one of said drums being provided with a transverse perforated partition having an opening therein, combined with a furnace having grates on opposite sides of the drums, and deflecting-surfaces arranged at different levels for respectively directing the products of combustion inwardly and outwardly with respect to the longitudinal tubes connecting the drums, substantially as described.

7. A water-tube boiler comprising two vertical drums placed at opposite ends of the furnace and each having a water and a steam space, horizontal headers extending laterally from the said drums and connected by longitudinal tubes, part of which form water-tubes and part form drying or superheating tubes, longitudinal tubes directly connecting the two vertical drums, combined with a furnace having grates on opposite sides of the drums, and deflecting-surfaces arranged at different levels for respectively directing the products of combustion inwardly and outwardly with respect to the longitudinal tubes connecting the drums; the lower deflecting-surfaces being arranged between the headers and part of the upper deflecting-surfaces being arranged between the tubes connecting the headers while the remaining parts of said upper deflecting-surfaces extend from the headers to the connecting-tubes of the drums, substantially as described.

702,671. MACHINE FOR FINISHING TONGUES. GEORGE W. FACKER, Chicago, Ill., assignor to the Dearing Harvester Company, Chicago, Ill. Filed Mar. 29, 1900. Serial No. 9,990. (No model.)

Claim.—1. In a machine for operating upon the sides and edges of tapering pieces, two cutting-heads, one arranged above and the other below the path of the material to be acted upon, mechanism for operating said cutting-heads, fluid-operated means independent of said mechanism for holding said cutting-heads above and below the path of the material and for positively moving said cutting-heads toward each other to act upon said material, and a trip for admitting the fluid to operative relation with said means, said trip being located beyond the cutting-heads to be engaged and actuated by the material after a predetermined length of said material has passed the cutting-heads whereby said means is caused to operate to move the cutting-heads toward each other.

2. In a machine for operating upon the sides and edges of tapering

pieces, two cutting-heads, one arranged above and the other below the path of the material to be acted upon, mechanism for operating said cutting-heads, fluid-operated means independent of said mechanism for moving said cutting-heads toward each other and for yieldingly holding them in operative relation to the material to be acted upon, and a trip for admitting fluid into operative relation to said means, said trip being located beyond the cutting-heads to be engaged and actuated by the material after a predetermined length has passed the cutting-heads, whereby said fluid-operated means is caused to operate to move the cutting-heads toward each other and yieldingly hold them in operative position.

3. In a machine of the character described, a feeding device, a presser adapted to act in opposition thereto and means made operative by the material being placed in the machine, for moving the presser upon said material, supports and passage-ways for the material being acted upon, a cutting-head, means for holding said cutting-head out of the path of the material until a predetermined length has been fed past the cutting-head and for thereafter moving said cutting-head into operative relation to said material, and a trip for said means located beyond the cutting-head in the path of the material to cause said means to become operative to act on a part only of said material.

4. In a machine for the purpose described, supports and passage-way for the material to be operated upon, a cutting-head, means for holding said cutting-head out of the path of the material and for positively lowering the cutting-head as required, and a trip for said means located beyond the cutting-head in the path of and to be actuated by the material after a predetermined length has passed the cutting-head to cause said means to operate and positively lower the cutting-head to act on a part only of said material.

5. In a machine for the purpose described, one or more cutting-heads, a feeding-roller adapted to operate upon one side of the wood or other material operated upon, a pressing-roller upon the opposite side thereof, mechanism for forcing said pressing-roller against the material operated upon; in combination with a tripping device, controlled by the material to be operated upon, whereby the latter is thus held against the said feeding-roller, all combined, substantially as described.

6. In a machine for the purpose described, a feeding-roller, a presser to force the material being operated upon against the said feeding-roller, tripping mechanism operated by the material to be acted upon to estimate the said presser and thus cause it to force the material being operated upon against the feeding-roller, a planing-head adapted to plane the under surface of the material being operated upon, and a chamfering-head adapted to operate upon the said material, all combined, substantially as described.

7. In a machine for the purpose described, a feeding-roller, a presser adapted to act in opposition thereto, a tripping device adapted to be actuated by the material being placed in the machine, and then cause the presser to force the material against the feeding-roller, and to press downward upon tapering pieces of material operated upon, as it passes through the machine, all combined, substantially as described.

8. In a machine for the purpose described, a feeding-roller, a presser adapted to act in opposition thereto, a tripping device adapted to be moved by the material being placed in the machine, and then cause the presser to force the material against the feeding-roller, and to press downward upon any tapering piece of material operated upon, as it passes through the machine, a cutting device adapted to act upon the said tapering material being operated upon, and mechanism for causing it to follow down the incline of said taper, all combined, substantially as described.

9. In a machine for the purpose described, a cutting-head, a feeding-roller, a presser normally held in such position as to permit the entrance of the material to be operated upon, and the tripping device, in combination with the air-pressure cylinder and its mechanism, suitably connected to the said presser, all combined, substantially as described.

10. In a machine for the purpose described, a support and passage-way for the material to be operated upon, cutting-heads above and below said passage-way, an air-pressure cylinder, provided with suitable valves and piston, the latter connected to said cutting devices and adapted to move them, and mechanism adapted to cause air to be admitted to the said cylinder and the said heads thus be forced to position to operate, substantially as described.

11. In a machine for the purpose described, a support and passage-way for the material to be operated upon, a cutting device below said passage-way movably supported upon the main frame, a cutting device above said passage-way, also suitably supported upon the said main frame, mechanism adapted to raise the cutting device located below the line of said supports and passage-way, and maintain it in a definite position, said cutting device that is located above said supports and passage-way adapted to be moved gradually downward during the passage of any tapering piece being operated upon, all combined, substantially as described.

12. In a machine for the purpose described, a support and passage-way for the material to be operated upon, a cutting device below said

passage-way movably supported upon the main frame, a cutting device above said passage-way, also suitably supported upon the said main frame, mechanism adapted to raise the cutting device that is located below the line of said supports and passage-way, and maintain it in a definite position, said cutting device that is located above said supports and passage-way adapted to be moved gradually downward during the passage of the tapering piece being operated upon, and means in common for moving the said cutting device to their work, said means adapted to move the lower one to a definite position, and permit the upper one to act in a constantly-varying position, all combined, substantially as described.

13. In a machine for the purpose described, a support and passage-way for the material to be operated upon, a cutting device located below said passage-way and movably supported upon the main frame, a cutting device located above said passage-way and also suitably supported upon the main frame, and mechanism for moving said cutting devices toward each other and thereafter for maintaining the cutting device located below the passage-way in a definite position and continuing the movement of the cutting device located above the passage-way toward the cutting device located below the said passage-way.

702,672. LOOM-SHUTTLE. ISA F. FINE, Warwick, R. I., assignor of one-half to Charles L. Levering, Taunton, Mass. Filed Aug. 24, 1901. Serial No. 78,122. (No model.)

Claim.—1. In a loom-shuttle, in combination, a shuttle-body having open yarn-passages, a threading-plate having a depending sleeve, and a tubular end entering the said sleeve and having the entering end thereof expanded to thereby secure the threading-plate to the shuttle-body, the said sleeve forming with said tubular end an elongated joint, thereby giving strength and stability, substantially as described.

2. In a loom-shuttle, in combination, the shuttle-body having the open yarn-passages, the threading-plate having the screw-threaded depending sleeve, and the tubular end entering the said sleeve and screw-threaded to engage therewith, the said end having its entering end expanded to secure the parts against loosening, substantially as described.

3. In a loom-shuttle, in combination, a shuttle-body having open yarn-passages, a threading-plate having a depending sleeve, a tubular end entering the said sleeve and having the entering end thereof expanded to thereby secure the threading-plate to the shuttle-body, and the sleeve is surrounded by the said depending sleeve, substantially as described.

4. In a loom-shuttle, in combination, the shuttle-body having the open yarn-passages, the threading-plate having the screw-threaded depending sleeve, the tubular end entering the said sleeve and screw-threaded to engage therewith, the said end having its entering end expanded to secure the parts against loosening, and the sleeve is surrounded by the said depending sleeve, substantially as described.

5. In a loom-shuttle, in combination, a shuttle-body having open yarn-passages, a threading-plate having a depending screw-threaded sleeve, a end in screw-threaded engagement with the said sleeve and forming therewith an elongated joint giving strength and stability, and a second sleeve as 12 surrounding the said parts, the yarn making contact with the sleeve 12 in its path as it issues from the shuttle, substantially as described.

702,673. PAPER-FEED MECHANISM. FRANK M. PETERSON and HENRY H. HENDERSON, Chicago, Ill.; said Henderson assignor to said Peterson. Filed July 12, 1901. Serial No. 67,981. (No model.)

Claim.—1. In a paper-feed mechanism, the combination with a vertically-movable carrier adapted to support a stack of sheets of paper, of a feed-roll journaled transversely thereabove and adapted to frictionally engage and feed forward the sheets of the stack successively at each rotation thereof, of continuously-rotating separating-fingers automatically operating to withdraw the opposite side edge portions of the successive top sheets from the next underlying sheet immediately prior to the engagement of the feed-roll therewith, and holding devices automatically operated immediately after the operation of the separating devices to hold the remaining sheets of the stack against displacement during the feeding forward of the top sheet, substantially as described.

2. In a paper-feed mechanism, the combination with a suitable frame and a vertically-movable carrier-plate guided therein and adapted to support a stack of sheets of paper, of a feed-roll journaled in the upper por-

tion of said frame transversely thereof and directly above said stack of paper, said roll being provided with a friction-surface on its periphery whereby it is adapted to engage and feed forward the top sheet of the stack at each rotation thereof, a pair of separating-fingers supported above the rear edge portions of the stack, means for continuously rotating said fingers driven from the feed-roll whereby the free ends of said fingers are caused during the lower portion of their rotary travel to wipe over the upper face of the stack and frictionally carry the opposite side edge portions of the top sheet inwardly toward each other, and automatically-operated clamping-fingers adapted to bear upon and hold the remaining sheets of the stack while the top sheet is being fed forward, substantially as described.

3. In a paper-feed mechanism, the combination with a suitable frame and a vertically-movable carrier-plate guided therein and adapted to support a stack of sheets of paper, of a feed-roll journaled transversely above the upper portion of said frame, an oscillatory rod journaled across the upper rear portion of said frame parallel with the feed-roll, a pair of hangers journaled on the spindle of said feed-roll, a pair of shafts at one end independently journaled in said hangers and geared to the spindle of the feed-roll and extending rearwardly of and at right angles to the latter and at their rear ends overlying said rod, a pair of separating-fingers fixed on said shafts and at their free ends frictionally engaging the side marginal portions of the top sheet in directions at right angles to the direction of the feed, a pair of clamping-fingers keyed on said rod and overlying the rear edge of the stack, arms on the opposite ends of said oscillatory rod, a spring between the outer end of one of said arms and a stationary point on the frame and leading to depress said clamping-fingers, a disk geared to the spindle of the feed-roll and having a cam projection on its periphery, and a lever pivoted on the frame and having one end engaging the periphery of said cam-disk, and its other end adapted to engage the other arm of the oscillatory rod to estimate the latter against the tension of the said spring and thereby raise the clamping-fingers, substantially as described.

4. In a paper-feed mechanism, the combination with a suitable frame and a movable carrier-plate guided therein and adapted to support the stack of sheets of paper, of a spring-pressed feed-roll journaled horizontally across the top portion thereof, a pair of shafts extending rearwardly of and at right angles to the feed-roll and independently geared at their inner ends to the spindle of said feed-roll, a pair of separating-fingers fixed on said last-named shafts and rotating synchronously but in a phase at right angles to that of the feed-roll, and serving, through frictional engagement with the top sheet, laterally thereof, to separate the side edge portions thereof from the next underlying sheet, an oscillatory rod supported at the rear upper end of the frame parallel with the feed-roll, a pair of clamping-fingers fixed on said rod and operating upon the stack at points outside the points of contact of the separating-fingers upon the stack and suitably-timed driving connections whereby said feed-roll, separating-fingers, and clamping-fingers are adapted to cooperate to effect the forward feeding of the sheets successively from the top of the stack, substantially as described.

5. In a paper-feed mechanism, the combination with a suitable frame of a vertically-movable carrier guided therein and adapted to support a stack of sheets of paper thereon, a feed-roll transversely journaled across the top of said frame, a pair of hangers journaled on the spindle of said feed-roll, a pair of rearwardly-extending shafts journaled in said hangers at right angles to the feed-roll and capable of independent automatic ver-

tical adjustment, intermeshing driving-gears on said last-named shafts and the spindle of the feed-roll, an oscillatory rod journaled in the upper rear portion of the frame upon which rod the free ends of said shafts are supported, a pair of separating-fingers fixed on said shafts, a pair of adjustable counterweights carried on the free ends of said shafts, a pair of clamping-fingers keyed on said rod, and mechanism for actuating said parts in properly-timed order to first separate the side marginal portions of the top sheet from the next underlying sheet, and then feed the same forward while the remaining sheets of the stack are securely clamped in place upon the carrier, substantially as described.

6. In a paper-feed mechanism, the combination with a suitable frame and a vertically-movable paper-carrier guided therein and adapted to support a stack of sheets of paper, of a feed-roll journaled horizontally above the upper portion of said frame, an oscillatory rod journaled across the upper rear portion of said frame parallel with the feed-roll, a pair of hangers journaled on the spindle of said feed-roll, a pair of shafts at one end journaled in said hangers and geared to the spindle of the feed-roll and extending rearwardly of and at right angles to the latter and having their rear ends suitably counterweighted and overlying said rod, a pair of separating-fingers fixed on said shafts and at their free ends frictionally engaging the side marginal portions of the top sheet in directions at right angles to the direction of the feed, a pair of clamping-fingers keyed on said rod and overlying the rear edge of the stack, shafts means operating upon said rod whereby said clamping-fingers are caused to clamp and hold the rear portion of the stack, and other positively-driven connections between the spindle of the feed-roll and said rod whereby said clamping-fingers are raised when the separating-fingers are operative to withdraw the side edge portions of the top sheet from contact with the corresponding portions of the underlying sheet preparatory to the feeding forward of the top sheet, substantially as described.

7. In a paper-feed mechanism, the combination with a suitable frame and a vertically-movable paper-carrier guided therein and adapted to support a stack of sheets of paper, of a feed-roll journaled horizontally above the upper portion of said frame, an oscillatory rod journaled across the upper rear portion of said frame parallel with the feed-roll, a pair of hangers journaled on the spindle of said feed-roll, a pair of shafts at one end independently journaled in said hangers and geared to the spindle of the feed-roll and extending rearwardly of and at right angles to the latter and at their rear ends overlying said rod, a pair of separating-fingers fixed on said shafts and at their free ends frictionally engaging the side marginal portions of the top sheet in directions at right angles to the direction of the feed, a pair of clamping-fingers keyed on said rod and overlying the rear edge of the stack, arms on the opposite ends of said oscillatory rod, a spring between the outer end of one of said arms and a stationary point on the frame and leading to depress said clamping-fingers, a disk geared to the spindle of the feed-roll and having a cam projection on its periphery, and a lever pivoted on the frame and having one end engaging the periphery of said cam-disk, and its other end adapted to engage the other arm of the oscillatory rod to estimate the latter against the tension of the said spring and thereby raise the clamping-fingers, substantially as described.

8. In a mechanism of the character described, the combination with the paper-carrier, the feed-roll and the laterally-operating separating-fingers serving to curl upwardly and inwardly the opposite side margins of successive sheets, of a pair of oscillatory clamping-fingers adapted to overlie the rear margin of the paper-carrier and having their free ends formed with convex engaging surfaces curved in a direction transversely of the carrier, substantially as and for the purpose described.

9. In a mechanism of the character described, the combination with the paper-carrier, the feed-roll and the laterally-operating separating-fingers serving to curl upwardly and inwardly the opposite side margins of successive sheets, of a pair of oscillatory clamping-fingers adapted to overlie the rear margin of the paper-carrier and having their free ends curved inwardly and upwardly so as to provide convex engaging surfaces curved in a direction transversely of the carrier, said convex engaging surfaces of the fingers being corrugated or roughened, substantially as and for the purpose described.

702,674. ROTARY ENGINE. FRANK PHILLIPS, Chicago, Ill. Filed Oct. 24, 1901. Serial No. 78,817. (No model.)

Claim.—1. A rotary engine comprising a cylinder divided longitudinally into a plurality of compartments by means of heads, a shaft passing centrally through said cylinder, passages through said heads connecting adjacent compartments, inlet-ports, passages connecting said inlet-ports with one of said chambers, disks rigidly mounted on said shaft and adapted to completely fill said compartments, pockets in the faces of one disk adapted as said shaft revolves to register successively with said inlet-passages and said other passages, pockets in the adjacent faces of said other disks adapted to register with said other passages simultaneously with the pockets in said first-mentioned disk, whereby steam entering said pockets at said inlet-passages will expand as same registers with said other passages, thereby imparting an impulse to said shaft, and exhaust-ports connecting with the last of said other passages.

2. A rotary engine comprising a cylinder divided longitudinally into three compartments by means of heads, a shaft passing centrally through said cylinder, passages through said heads connecting adjacent compartments, inlet-ports, passages connecting said inlet-ports with the middle one of said compartments, disks rigidly mounted on said shaft and entirely filling said compartments, pockets in each face of the middle one of said disks adapted as said shaft revolves to register successively with said inlet-passages and said other passages, pockets in the adjacent faces of said other disks adapted to register with said passages simultaneously with said pockets in said middle disk, whereby steam entering said pockets in said middle disk from said inlet-passages will expand into said other pockets, thereby imparting an impulse to said shaft, and an exhaust-ports connected with one of said passages in each of said heads.

3. A rotary engine comprising a cylinder divided longitudinally into a plurality of compartments by means of heads, a shaft passing centrally through said cylinder, passages through said heads connecting adjacent compartments, a plurality of inlet-ports, passages connecting said inlet-ports with one of said chambers, disks rigidly mounted on said shaft and adapted to completely fill said compartments, pockets in the faces of one disk adapted as said shaft revolves to register successively with said inlet-passages and said other passages, pockets in the adjacent faces of said other disks adapted to register with said other passages simultaneously with the pockets in said first-mentioned disk, whereby steam entering said pockets at said inlet-passages will expand as same registers with said other passages, thereby imparting an impulse to said shaft, and exhaust-ports connecting with the last of said other passages.

4. A rotary engine comprising a cylindrical casing divided longitudinally into a plurality of compartments by means of heads, a shaft passing centrally through said cylinder, passages through said heads connecting adjacent compartments, said passages being divided and having one more opening at their delivery ends than at their inlet ends, inlet-ports in said heads, passages in said heads connecting one of said compartments with said inlet-ports, disks rigidly mounted on said shaft and entirely filling said compartments, pockets in one of said disks adapted as said shaft revolves to register successively with said inlet-passages and said other passages, pockets in said other disks in alignment with said first-mentioned pockets and adapted as said shaft revolves to register simultaneously with said passages, whereby steam entering said pockets at said inlet-passages will expand as same registers with said other passages, thereby imparting an impulse to said shaft, and exhaust-ports connecting with the last of said other passages, whereby the expanded steam is allowed to escape.

5. A rotary engine comprising a cylindrical casing divided longitudinally into a plurality of compartments by means of heads, a shaft passing centrally through said cylinder, passages through said heads connect-

trading between the engineer's valve and the triple valve and a cock located in said pipe and having a supplemental restricted port through which air may be exhausted from the triple-valve casing.

702,680. FAUCET. FRANK P. SPANNAKER, Philadelphia, Pa., assignor to James S. Spannaecker Manufacturing Company, a Corporation of Delaware. Filed Nov. 22, 1901. Serial No. 88,589. (No model.)

Claim.—1. In a faucet, the combination with a normally closed valve controlling the passage to the delivery-spout and operating within said passage, and a delivery-spout communicating with said passage, of a lever engaging said valve, said lever being situated adjacent said spout and extending around the same and being guided thereby.

2. In a faucet, the combination with a valve controlling the passage to the delivery-spout thereof, of a lever engaging the stem of the valve, the free end of said lever being situated adjacent the delivery-spout, and a supplemental lever engaging said lever for locking the same.

3. In a faucet, the combination with a valve controlling the passage to the delivery-spout, of a lever having a head engaging the stem of said valve, the free end of said lever being situated adjacent the delivery-spout, and a supplemental lever provided with a socket to engage the head of said lever when the latter is in position to hold the valve open.

4. In a faucet, the combination with a body portion having a valve-seat communicating with the inlet-passage of the faucet, a passage leading from said valve-seat to the delivery-spout, a valve within said seat, a stem extending from said valve through the body of the faucet, a casing upon the forward portion of said faucet receiving the end of said valve-stem, and a spring engaging said stem for holding the valve normally closed, of a lever pivoted in said casing and provided with a head engaging the end of the valve-stem, the free end of said lever being situated adjacent the delivery-spout, and a supplemental lever pivoted within said casing and having a socket engaging the head of said lever when the latter is moved to open the valve.

5. In a faucet, the combination with a plug having a non-corrodible lining, and a head, of a glass tube interposed between said plug and head, and a spout leading from said head provided with non-corrodible lining.

6. In a faucet, the combination with a plug and head, of a tube interposed between said plug and head, said plug and head being removably held against the ends of said tube and a spout connected with said head and removable therefrom.

7. In a faucet, the combination of a plug and a head, of a tube interposed between said plug and head, the rods connecting said plug and head and serving to hold the same in contact with the ends of the tube, and a spout connected with said head and removable therefrom.

702,681. TREATMENT OF COTTON-SEED HULLS. JOHN C. W. STANLEY, New York, N. Y. Filed Sept. 28, 1901. Serial No. 70,006. (No specimens.)

Claim.—1. The process of obtaining coarse meal free from fiber from cotton-seed hulls, which consists in reducing said hulls to a matted mass of fiber and coarse meal, and subjecting said mass to the action of shearing and sifting, substantially as set forth.

2. The process of obtaining coarse meal free from fiber from cotton-seed hulls, which consists in reducing said hulls to a matted mass of fiber and coarse meal, and subjecting said mass to a series of shearing and sifting actions, the shearing alternating with the sifting, substantially as set forth.

3. As an improved product from cotton-seed, coarse hull-meal carbonized and free from cotton fiber.

702,681.

702,682. APPARATUS ACTUATED BY CLOCK-MOVEMENTS FOR STARTING OR STOPPING MACHINERY. JOHN S. SCHMIDT, London, England. Filed Feb. 12, 1902. Serial No. 92,002. (No model.)

Claim.—1. In a mechanical starting or stopping device, the combination with a clock-movement, a spring, means for putting said spring under tension, a starting or stopping rod, a hooked arm carried thereby, interengaging means between said arm and pivoted member, and means acting on said member to normally hold said interengaging means in locked position.

2. In a mechanical starting or stopping device, the combination of

a clock-movement, a spring, means for putting said spring under tension, a pivoted member arranged to be engaged directly by the spring as it unwinds, a starting or stopping rod, a hooked arm carried thereby, interengaging means between said arm and pivoted member, and means acting on said member to normally hold said interengaging means in locked position.

3. In a mechanical starting and stopping device, the combination of a clock-movement, a spring, means for putting said spring under tension, an escapement-wheel, a gear-train connecting said escapement-wheel with the spring, means for normally holding said escapement-wheel stationary, a pivoted pawl which bears upon the spring, a starting or stopping rod, a spring which tends to move said rod away from the pawl, a hook carried by the rod and adapted to engage with the pawl when the spring is under tension and thereby hold the rod against the resistance of its spring, and means operated by the clock-movement for releasing the escapement-wheel at a prearranged time substantially as described.

702,683. POWER-TRANSMITTING DEVICE FOR MATCH-MACHINES. THOMAS W. SYMPTON, Wrentham, N. J. Filed June 4, 1901. Serial No. 63,578. (No model.)

Claim.—In a power-transmitting device for match-machines, a power-shaft, a main shaft positively geared thereto, angularly-disposed shafts positively geared to said main shaft, worms on said shafts, and gears meshing with said worms, shafts carrying said gears, and sprocket-wheels on said shafts.

702,684. RATCHET MECHANISM. ANTHONY VAN WAGEN, St. Louis, Mo. Filed Aug. 14, 1901. Serial No. 72,928. (No model.)

Claim.—1. In a ratchet mechanism, the combination, with a ratchet-wheel revolvably mounted, of two pawls therefor, independently pivoted, and engaging said wheel on the same side thereof, an actuating device for reciprocating one of them, and a connecting device connecting said pawls and arranged to impart motion to that pawl which is not directly driven by the actuating device, and to cause it to reciprocate in opposition to the reciprocation of said first pawl.

2. In a ratchet mechanism, the combination, with a ratchet-wheel revolvably mounted, of two pawls therefor, separate adjustable pivots or transmitters for said pawls, whereby they may be adjusted laterally and independently, an actuating device for reciprocating one of them, and a connecting device connecting said pawls and arranged to impart motion to that pawl which is not directly driven by the actuating device, and to cause it to reciprocate in opposition to the reciprocation of said first pawl.

3. In a ratchet mechanism, the combination, with a ratchet-wheel revolvably mounted, of two pawls therefor, independently pivoted, an actuating device for reciprocating one of them, and a link connected to one pawl at a point between its pivot and the ratchet-wheel, and to the other pawl at a point on the side of the pivot opposite the ratchet-wheel, and adapted to cause the second pawl to reciprocate in opposition to the first.

4. In a ratchet mechanism, the combination, with a ratchet-wheel revolvably mounted, of two pawls therefor, an electromagnet for reciprocating said pawls, an armature carried by one of them, separate pivot-screws for said pawls, whereby they may be adjusted independently in lateral position, a link connected to one pawl at a point between its pivot and the ratchet-wheel, and to the other pawl at a point on the side of the pivot opposite said ratchet-wheel, and a retractile spring.

702,685. BAG-HOLDER. JOSEPH P. ADAMS, Garfield, Wash. Filed Dec. 22, 1901. Serial No. 86,910. (No model.)

Claim.—1. A bag-holder, comprising a chute, outwardly-directed bag-engaging flanges carried externally by opposite sides of the chute and provided with perforations, vertically-reciprocating bag-engaging impaling-pins mounted upon the chute and working through the perforations in the flanges, and means for raising and lowering the pins.

2. A bag-holder, comprising a chute, outwardly-directed perforate flanges carried externally by opposite sides of the chute, bag-impaling pins mounted upon the chute and working through the perforations, and means mounted upon the chute for simultaneously raising and lowering the pins to project the same through and withdraw them from the perforations of the flanges.

3. A bag-holder, comprising opposite outwardly-directed perforate flanges, vertically-reciprocating pins working through the perforations, opposite upstanding bell-crank levers connected to the pins, and a handle connecting the bell-crank levers for simultaneous manipulation.

4. A bag-holder, comprising opposite members having outwardly-directed perforate flanges, and perforate guides located above and in vertical alignment with the perforations in the flanges, corresponding laterally-projecting arms carried by the members, vertically-reciprocating bag-impaling pins working in the respective guides and perforations of the flanges, levers fulcrumed intermediately upon the arms and connected to the adjacent pins, and a handle connecting the outer end portions of the levers for simultaneous manipulation.

5. The combination with a chute or hopper, of opposite outwardly-directed perforate bag-engaging flanges carried by the discharge end thereof, vertically-reciprocating bag-impaling pins working through the perforations of the flanges, intermediately-fulcrumed levers connected to the pins, and a handle connecting the levers for simultaneous operation.

6. The combination with a chute or hopper, of a bag-holder comprising plates secured to opposite sides of the chute or hopper and having lower outwardly-directed perforate flanges, perforate guide-arms projected laterally outward from the plates and aligned with the perforations in the flanges, lateral arms projected from the upper portions of the plates, bell-crank levers fulcrumed upon the respective arms, a handle connecting the bell-crank levers for simultaneous manipulation, and bag-impaling pins working in the perforations in the flanges and the guides and also connected to the respective levers.

7. A bag-holder, comprising opposite plates having outwardly-di-

rosted perforate flanges at their lower edges, outwardly-directed perforate guide-arms struck from the plates and aligned with the perforations in the flanges, corresponding integral arms projected from the upper portions of the plates and lying in the plane thereof, a cross-bar connecting the arms, inverted substantially U-shaped impaling-pins working in the guides and the perforations of the respective plates, bell-crank levers fulcrumed upon the respective arms and connected to the heads of the respective impaling-pins, and a cross-bar handle connecting the upper ends of the levers for simultaneous manipulation.

702,686. FRED TROUSE. JUNE E. ALLEN, St. Louis, Mo., assignor of one-half to Charles W. Springer, St. Louis, Mo. Filed Nov. 5, 1901. Serial No. 81,308. (No model.)

Claim.—1. In a feed-trough, the two frames 1 each composed of a rod bent into suitable form; the connecting-rod 2 hinging said frames together; the curved heads 3 extending from the front ends of the frames, and adapted to engage the loops of the wagon-tongue; said heads being adapted to fold together when the frames are folded so that they may be readily passed through the loop of the wagon-tongue; and said heads being adapted to spread out when the frames are spread out as required to hold the feed-trough in position; the curved arms 4 extending from the rear ends of the frames as required to form a ring, and engage the wagon-tongue when the frames are spread open for use; thus holding the feed-trough in position upon the tongue; and a suitable material attached to said frames and forming troughs or receptacles for the feed.

2. In a feed-trough, suitable frames hinged together; heads extending from the forward ends of said frames; said heads being adapted to fold together and pass through the loop of the wagon-tongue when the frames are folded and to spread out as required to engage the loop of the wagon-tongue and hold the frames in position; curved arms extending from the rear ends of the frames and together forming a ring to engage and encircle the wagon-tongue to hold the ends of the frames in position; and suitable material attached to said frames to form troughs or receptacles for the feed, substantially as submitted.

702,687. MARBLE WILLIAM H. ANDREWS, Chicago, Ill., assignor to Nelson & Krutner, Chicago, Ill., a firm. Filed Feb. 27, 1902. Serial No. 35,322. (No model.)

Claim.—1. In a mangle, the combination with the cylinder and the frame carrying guides, steam-chests supported upon and movable on said guides toward and away from said cylinder, of disks revolvably mounted on said frame concentric with said cylinder, projections on said disks, and arms pivotally connected at one end with said projections and at their other ends with said steam-chests, whereby when said disks are revolved said steam-chests will be moved.

2. In a mangle, the combination with the cylinder, the frame carrying guides, and the steam-chests supported upon and movable on said guides toward and away from said cylinder, of devices for imparting motion to said steam-chests, comprising disks revolvably mounted on said frame, peripheral projections on said disks, arms having curved ends adapted to embrace said disks connected at said curved ends with said projections and at their other ends with said steam-chests, whereby when said disks are revolved said arms will impart reciprocating motion to said steam-chests, said motion being variable and exerting variable leverage on said chests.

3. In a mangle, the combination with the cylinder, the frame carrying guides, and steam-chests supported upon and movable on said guides toward and away from said cylinder, of disks revolvably mounted on said frame concentric with said cylinder, peripheral projections on said disks, arms connected at one end with said peripheral projections and at their other ends with said steam-chests, springs interposed in said connections, and devices for revolving said disks.

4. In a mangle, the combination with the cylinder, the frame carrying guides, and steam-chests supported upon and movable on said guides toward and away from said cylinder, of disks revolvably mounted on said frame, peripheral projections on said disks, arms connected at opposite ends with said disks and said steam-chests, said arms having each one end bent concentric with said disks and adapted to embrace the latter when said steam-chests are in contact with said cylinder, and means for revolving said disks to move said chests, said disks being adapted to impart variable motion to said arms and exert variable leverage on said chests.

5. In a mangle, the combination with the cylinder, the frame carrying guides, and steam-chests supported upon and movable on said guides toward and away from said cylinder, of disks revolvably mounted on said frame, peripheral projections on said disks, arms connected at opposite ends with said disks and said steam-chests, springs interposed in said connections, said arms being concentric with said disks at one end and adapted to embrace the latter when said steam-chests are in action, means for revolving said disks to impart motion to said steam-chests, and means for locking said disks against revolution in one direction to hold said steam-chests compressed against said cylinder.

6. In a mangle, the combination with the frame, a cylinder revolvably mounted thereon, and guides on said frame extending radially from the axis of rotation of said cylinder, of steam-chests supported upon and movable on said guides, disks revolvably mounted on said frame concentric with said cylinder, peripheral projections on said disks, and arms having semicircular ends concentric with said disks secured at one end to said peripheral projections and adapted to embrace said disks, and connected at their other ends with said steam-chests in alignment with said guides, whereby when said steam-chests are in action said disks will be held a little past dead-center by said arms, thereby locking said steam-chests against movement.

702,688. MED. LEVI H. BACHMAN, Chicago, Ill. Filed Aug. 22, 1902. Serial No. 27,577. (No model.)

Claim.—1. In a bed structure, the combination with downwardly and upwardly adjustable end portions, of side rods, or links, connected with said downwardly-adjustable portion, and a second set of side rods, or links, secured rigidly to the upwardly-adjustable portion, and pivotally connected with the first-mentioned side rods, or links, whereby the upward swinging movement of the upwardly-adjustable end portion will lower the first-mentioned side rods, or links, and thereby cause the depression of the downwardly-adjustable end portion, substantially as described.

2. In a bed structure, the combination with the main fixed portion of the bed-bottom, of front and end sections thereof pivotally connected therewith, the front end section being adapted for downward adjustment, and the rear end section for upward adjustment, a pair of side rods pivotally connected to the front end section, and a second pair of side rods secured rigidly to the rear end section and pivotally connected with the rods which are connected to the front end section, substantially as described.

3. In a bed structure, the combination with the downwardly-adjustable end portion and the upwardly-adjustable rear end portion, of a pair of side rods pivotally connected to the front adjustable portion, a second pair of side rods rigidly secured to the rear end portion, and pivotally connected directly to the first-mentioned side rods, and means attached to the front end section and adapted to engage the bed-frame, whereby the said sections will lock the front end portion in downward adjustment, and will thereby also lock the rear end portion through the medium of the two sets of side rods, substantially as described.

4. In a bed structure, the combination with the main or body portion of the bed-bottom, of an end portion thereof adjustable relatively to said main portion, the said end portion comprising three relatively adjust-

able portions pivotally connected with one another, whereby the one near the body portion of the bed-bottom is relatively long and the intermediate portion is relatively short, whereby the outermost portion can be bent back closely to the first portion so as to lie parallel therewith, substantially as described.

702,689. MED. LEVI H. BACHMAN, Chicago, Ill. Filed Aug. 22, 1902. Serial No. 27,578. (No model.)

Claim.—1. In a bed structure, the combination with an angularly-adjustable side portion, of a section attached to said side portion and having sliding connections therewith, said section being adapted to engage

the frame of the bed structure, and arms connected with said adjustable side portion and provided with notches adapted to engage the bed-frame, substantially as described.

2. A bed structure comprising a middle longitudinal portion, and side longitudinal portions pivotally connected with the middle longitudinal portion, sections attached to said sections and provided with notches adapted to engage the bed-frame, the sections of one side portion having connections therewith, arms connected with the last-mentioned side portion and provided with notches or recesses, abutments on the bed-frame adapted to engage said notches or recesses, and means for releasing both of the sections attached to one or the other of the side sections, substantially as described.

3. The combination in a bed structure, of a receptacle, here connected with said receptacle and provided with sockets, and bars on the bed-frame adapted to serve as guideways for said sockets, and also provided with sockets adapted to receive the bars on the receptacle, and to permit the same to slide through them, substantially as described.

702,690. MED. LEVI H. BACHMAN, Chicago, Ill. Filed Sept. 24, 1902. Serial No. 30,332. (No model.)

Claim.—1. In a bed structure, the combination with the stationary portion of the bed, of a swinging end portion pivotally connected with the end of said stationary portion and composed of relatively long and short portions pivotally connected together with the short portion outermost, a downwardly-extending projection on the relatively long section, sections pivotally connected with said downwardly-extending projection and provided with notches adapted to engage the bed-frame, and a pair of side rods each of which has one end pivotally connected directly with said relatively short section, and the other end pivotally connected with the bed-frame, substantially as described.

2. In a bed structure, the combination of a central stationary middle portion, swinging end portions each consisting of long and short sections, sections carried by the end portions and having notches flanges on the legs of the structure with which said notches can engage, cords attached to said sections for unlatching the same and rods pivotally connected with the outer ends of the short sections of the swinging end portions and also pivotally connected with the framework of the bed structure, substantially as described.

702,691. DAVENPORT MED. LEVI H. BACHMAN, Chicago, Ill. Filed Jan. 11, 1901. Serial No. 45,821. (No model.)

Claim.—1. In a bed structure, the combination of a stationary body part, a swinging part comprising a swinging frame pivotally connected with the body part having end rods extended beyond the points of pivotal connection, and means for engaging the extended portions of said rods so as to lock the swinging frame in an elevated position, substantially as described.

2. In a bed structure, the combination of a body part, a swinging frame having end rods extended beyond the points of pivotal connection, a locking device consisting of a pair of longitudinally-slidable rods adapted for projection beyond the ends of the body part so as to engage the said

extended portions of the end rods of the swinging frame, and means for shifting said rods, substantially as described.

3. In a bed structure, the combination with the body part and the swinging pivoted frame having side rods provided with extensions, of a pair of longitudinally-shiftable rods adapted for projection beyond the ends of the body part so as to engage the extensions of said end rods, guides for the ends of said shiftable rods, and a pivoted hand-lever connected with the inner ends of said shiftable rods, the points of connection being on opposite sides of the point of pivotal support, substantially as described.

702,692. BED. LEVI H. RAGHMAN, Chicago, Ill. Filed Mar. 1, 1901. Serial No. 48,401. (No model.)

Claim.—1. In a bed structure, the combination of a swinging side portion, sectors attached thereto, the said sectors having their inner or free ends provided with notches, the legs of the bed structure being provided with long slots in which the sectors can work and whose lower edge the notches in the sectors can engage, pins arranged upon the inner ends of the sectors, and swinging catches pivoted to the legs of the bed structure and having recesses adapted to engage the pins on the ends of the sectors, whereby upon a supplemental elevation of the swinging side portion the pins on the sectors will engage the recesses on the swinging catches, and will cause the inner ends of the sectors to be retained in an elevated position, and thereby permit the swinging portion of the bed-bottom to descend, substantially as described.

2. A bed structure comprising a central, stationary, longitudinal portion, a couple of swinging side portions pivoted to the opposite sides of the central portion, sectors attached to the swinging side portions near their outer ends, the said sectors having slots formed in their lower sides near their inner ends and being provided with laterally-projecting pins at or near each end, the legs of the bed structure being provided with slots in which the sectors can travel and with whose lower edges the notches in the sectors can engage, and pivoted catches pivoted to the legs of the bed structure below the slots therein, the said catches being provided with recesses adapted to engage the pins on the sectors, whereby the inner ends of the sectors will be raised by the engagement of the pins with the catches upon a supplemental elevation of the swinging side portions and will thereby permit the side portions to descend without interference, substantially as described.

3. A device for supporting a swinging structure in an elevated position, comprising a bar or rod, means for engaging the same when the swinging section is elevated, and means for disengaging the bar or rod upon a supplemental elevation of the swinging section, said means consisting of a swinging arm or catch, and means on the bar for engaging the same, the swinging arm or catch being arranged to swing outwardly and thereby elevate the bar or rod upon a supplemental outward movement of the said bar or rod, substantially as described.

4. A device for supporting a swinging section in an elevated position, consisting of a locking bar or rod, means for engaging the same so as to hold the section in an outward or elevated position, a swinging arm or catch, and means on the locking bar or rod for engaging such arm or catch, the latter being arranged so that when engaged it will swing the supporting bar or rod so as to disengage the same upon a supplemental upward or outward movement of the swinging section and will prevent

the reengagement of the bar during the inward or return movement of the same, substantially as described.

5. The combination with the locking bar or rod 4, of means for engaging the same, and the swinging arm 6 pivoted to the engaging means, the said locking bar being provided with means for engaging the swinging arm 6 whereby when so engaged the swinging movement of the arm 6 will shift the lateral position of the locking-bar, substantially as set forth.

702,698. PROCESS OF PRODUCING DESIGNS OR DELINEATIONS ON METAL SURFACES. RUDOLPH F. BARTLA, Philadelphia, Pa., and ALBERT R. HORN, Baltimore, Md. Filed Feb. 24, 1902. Serial No. 48,188. (No specimen.)

Claim.—1. The herein-described process of producing a design on a metal surface which consists in forming the design on a flexible sheet with a substance which will serve as a vehicle for a mordant, placing said sheet on the metal surface and applying pressure thereto for causing said substance to adhere in whole or in part to said surface, and causing the design to be chemically produced on the metal by a suitable mordant associated with said substance.

2. The herein-described process of producing a design on a metal surface which consists in forming the design on a flexible sheet with a substance which will serve as a vehicle for a mordant, placing said sheet on the metal surface and applying pressure thereto for causing said substance to adhere in whole or in part to said surface, and associating a suitable mordant with said substance.

3. The herein-described process of producing a design on a metal surface which consists in mixing a suitable mordant with a suitable vehicle, forming the design with said compound on a flexible sheet, placing said sheet on the metal surface, and applying pressure to said sheet for causing said compound to adhere in whole or in part to said surface.

4. The herein-described process of producing a design on a metal surface which consists in forming the design on a flexible sheet with a substance which will serve as a vehicle for a mordant, placing said sheet on the metal surface and applying pressure thereto for causing said substance to adhere in whole or in part to the metal, associating a suitable mordant with said substance at any time prior to the next step in the process, and treating the metal surface to a bath of a suitable liquid carbon compound.

5. The herein-described process of producing a design on a metal surface which consists in forming the design on a flexible sheet with a substance which will serve as a vehicle for a mordant, placing said sheet on the metal surface and applying pressure thereto for causing said substance to adhere in whole or in part to said surface, associating a mordant with said substance at any time prior to the next step in the process, heating said surface, and thereafter treating it to a bath of some suitable liquid carbon compound.

6. The herein-described process of producing a design on a metal surface which consists in mixing a mordant with a suitable vehicle, forming the design with said compound on a flexible sheet, placing said sheet on the metal surface and applying pressure thereto for causing said substance to adhere in whole or in part to the metal, and thereafter treating the metal surface to a bath of some suitable liquid carbon compound.

7. The herein-described process of producing a design on a metal surface which consists in mixing a suitable mordant with a suitable vehicle, forming the design with said compound on a flexible sheet, placing said sheet on the metal surface and applying pressure thereto for causing said compound to adhere in whole or in part to the metal, applying heat to the metal surface and thereafter treating it to a bath of some suitable liquid carbon compound.

702,694. BOLLER. HENRY BUNDELTON, New York, N. Y. Filed Mar. 18, 1902. Serial No. 47,481. (No model.)

Claim.—1. A boiler and furnace with grate-bars substantially as set forth in combination with a water-pan located right beneath the grate-bars and having a rectangular rear portion, an obliquely-angular front por-

tion forming a mouth extending beyond the furnace-door and boiler-wall, a flow-off pipe in the top portion of the obliquely-angular front part, a cover adapted to close the flow-off pipe, a waste-pipe, and a water-pipe with water-supply-regulating valve.

2. In an improved boiler and furnace grate-bars substantially as set forth, a water-pan located right beneath the grate-bars having a rectangular rear portion, an obliquely-angular front portion forming a mouth which extends beyond the furnace-door and boiler-wall, a flow-off pipe in the top portion of the obliquely-angular front part, a cover on the top opening of the flow-off pipe adapted to close same, and a waste-pipe.

3. In an improved boiler and furnace a water-pan located beneath the fire having a rectangular rear portion, an obliquely-angular front portion forming a mouth which extends beyond the furnace-door and boiler-wall, a flow-off pipe in the top portion of the obliquely-angular front part and a cover on the top opening of the flow-off pipe adapted to close same.

702,695. SPARKING DEVICE. DONALD M. HALL, Brooklyn, Mass. Assignor to Halsey-Cutler Electric Company, Brooklyn, Mass., a Corporation of Massachusetts. Filed Nov. 7, 1901. Serial No. 41,432. (No model.)

Claim.—1. The combination with a series-wound dynamo; of a sparking device in the main circuit thereof; a branch circuit connecting the conductors of the main circuit; a circuit-controller in said branch circuit; and means for operating said circuit-controller to close said branch circuit when the main circuit is open and vice versa, substantially as and for the purpose described.

2. The combination with a series-wound dynamo; of a sparking device in the main circuit thereof; a branch circuit connecting the conductors of the main circuit; a circuit-controller in said branch circuit; and means operated by said sparking device for operating said circuit-controller, substantially as described.

3. The combination with a series-wound dynamo; of a sparking device in the main circuit thereof; a branch circuit connecting the conductors of the main circuit; an adjustable load in said branch circuit; a circuit-controller in said branch circuit; and means operated by said sparking device for operating said circuit-controller, substantially as described.

702,696. DOOR-STRIKE. BENJ. BOWEN, Brooklyn, N. Y. Filed Apr. 8, 1902. Serial No. 101,008. (No model.)

Claim.—1. A strike for spring-actuated doors, consisting of a box-shaped body formed of two L-shaped sections, guided one on the other, one of said sections being provided with an elastic cushion along its edge,

and means for attaching said body to the partition-wall, substantially as set forth.

2. A strike for spring-actuated doors, consisting of a box-shaped body formed of two L-shaped sections, guided one on the other, one of said sections being provided with guide-flanges at its upper and lower ends and with an outwardly-bent dovetailed flange at its edge, an elastic cushion in said flange, transverse fastening-bolts connecting the ends of said sections, and screw-nuts for said bolts, substantially as set forth.

702,697. HOUSE-TENNIS RACKET. EMILE BOULANGER, St. Louis, Mo. Filed Apr. 9, 1902. Serial No. 103,081. (No model.)

Claim.—The improvement in house-tennis rackets, comprising the combination with an ordinary house-tennis racket, having the usual frame and a movable cover stretched upon the frame; of a suitable stay extending from the handle outwardly to the opposite side of the frame, substantially as specified.

702,698. BOOKBINDER'S PRESS-PUNCH. PHILIP A. BOWER, Milwaukee, Wis. Filed Jan. 17, 1902. Serial No. 92,113. (No model.)

Claim.—1. In a press-punch of the class described, the combination of a supporting-base, provided with a longitudinal channel; a plurality of punch sets, each set comprising a punch and a die registering with each other and with said longitudinal channel; a punch-guide; a stationary shaft for adjustably connecting all of said punch sets together, located above said base; means for locking said sets at any desired point of adjustment in relation to each other, on said stationary shaft; a separate eccentric shaft adapted to bear against the upper ends and simultaneously operate all of said punches, and permit of any desired adjustment of said punch sets in relation to each other; and means for turning said eccentric shaft on its supporting-axis, and simultaneously operating all of said punch sets, as set forth.

2. In a press-punch of the class described, the combination of a supporting-base, provided with a longitudinal channel; a plurality of punch sets, each set comprising a punch and detachable die-plate, provided with a die, said punch and die registering with each other and with said lon-

longitudinal channel; a punch-guide; a stationary shaft adjustably connecting all of said sets together; means for locking said sets at any desired point of adjustment in relation to each other on said stationary shaft; an eccentric shaft adapted to bear against the upper ends and simultaneously operate all of said punches, and permit of any desired adjustment of said punch sets in relation to each other; and an operating-lever attached to said eccentric shaft, as set forth.

3. In a press-punch, of the class described, the combination of a supporting-base; a plurality of punch sets, each comprising a punch, a die registering with said punch and a punch-guide, the parts of each set being permanently connected together; a single stationary shaft connecting all of said sets together; means for locking said sets in any desired relative position to each other on said stationary connecting-shaft; a single eccentric shaft adapted to bear against and simultaneously operate all of said punches and permit of any desired adjustment of said punch sets in relation to each other; a longitudinal adjustable gage-bar for limiting the rearward movement of the paper to be punched; and a transverse gage-bar adjustably secured to said longitudinal bar; a spring for raising the punches of said several sets when relieved from the downward pressure of said eccentric shaft; an operating-lever connected with said eccentric shaft; a treadle adapted to be operated by foot-power; means for communicating motion from said treadle to the operating-lever of said eccentric shaft, as downward pressure is applied to said treadle; and means for raising said treadle and reversing the movement of said operating-lever when said treadle is relieved from downward pressure, as set forth.

4. In a press-punch of the class described, the device herein described for cutting an elongated recess in connection with a hole, consisting in the combination with the punch proper; of a vibratory lever pivotally connected at one end with the supporting-base, and connected at its opposite end with said punch; a secondary punch secured to said vibratory lever in close proximity to said first-mentioned punch; die registering with said punches; and means for simultaneously raising both of said punches when relieved from pressure, substantially as and for the purpose specified.

702,699. JOINTED FRAME FOR SOFA-BEDS, RECLINING-CHAIRS, &c. GEORGE W. BARTON, Camden, N. J., assignor to the Hale and Elbert Manufacturing Company, a Corporation of Pennsylvania. Filed Nov. 14, 1901. Serial No. 23,171. (No model.)

Claim.—1. In a counterbalanced sofa-bed or chair, the combination of the seat-frame, the back-frame, a hinged joint between the frames, and an adjustable spring-hinge also between the seat and back frames and to one side of the axis of the first-mentioned hinge-joint consisting of two rods hinged together and springs carried by the seat-back and seat-frame for respectively pressing the rods toward each other.

2. In a counterbalanced sofa-bed or chair, the combination of the seat-frame, the back-frame, a hinged joint between the frames, an adjustable spring-hinge also between the seat and back frames and to one side of the axis of the first-mentioned hinge-joint consisting of two rods hinged together and springs carried by the seat-back and seat-frame for respectively pressing the rods toward each other, and means for adjusting the power of the spring-hinge.

3. In a counterbalanced sofa-bed or chair, the combination of the seat-frame, the back-frame, a hinged joint between the frames, an adjustable spring-hinge also between the seat and back frames and to one side of the axis of the first-mentioned hinge-joint and consisting of two rods jointed together, springs acting to force the rods toward each other and

coils or cylinders for holding the springs attached respectively to the two frames.

4. In a counterbalanced sofa-bed or chair, the combination of the seat-frame, the back-frame, a hinged joint between the frames, an adjustable spring-hinge also between the seat and back frames and to one side of the axis of the first-mentioned hinge-joint and consisting of two rods adjusted together, springs acting to force the rods toward each other, coils or cylinders for holding the springs attached respectively to the two frames, and adjusting-screws carried by the cylinders to adjust the tension of the springs.

5. The combination in a sofa-bed or reclining-chair of the seat-frame and back-frame hinged together, a spring counterbalancing device secured to each frame and consisting of a sliding rod J, a cylinder I secured to the frame and through the end of which the rod moves, a spring M within the cylinder acting upon the rod, and an adjusting-screw P extending through the cylinder and acting upon the spring to adjust its tension, the sliding rod of the two devices being hinged together at their free ends to one side of the axis of the hinge between the frames.

6. In a counterbalanced sofa-bed or chair, the combination of a seat-frame, a back-frame, a double hinge D E between the said frames, and an adjustable spring-hinge also between the said frames to one side of the axis of the double hinge D E.

7. In a counterbalanced sofa-bed or chair, the combination of a seat-frame, a back-frame, a double hinge D E between the said frames, and an adjustable spring-hinge also between the said frames to one side of the axis of the double hinge D E and consisting of a spring-actuated rod on each frame detachably joined together at their free ends.

702,700. SASH-LOCKING MECHANISM. JAMES A. BROWN and EDWARD R. WHITTAKER, Paterson, N. J. Filed Mar. 17, 1901. Serial No. 95,514. (No model.)

Claim.—1. In a sash-locking mechanism, the combination of the window-frame, sashes arranged to slide therein, a rack carried by one of said sashes, a dog adapted to engage the rack and pivotally arranged in said frame, and means for actuating said dog, a portion of said means being carried by the other sash, substantially as described.

2. In a sash-locking mechanism, the combination of the window-frame, sashes arranged to slide therein, a dog pivoted in the frame and adapted to engage one of said sashes, a lever also pivoted in said frame and engaging said dog, a slide-rod arranged in one of said sashes and engaging said lever, and means for actuating said slide-rod, substantially as described.

3. In a sash-locking mechanism, the combination, with the window-frame, of sashes arranged to slide therein, a dog pivoted in said frame and adapted to engage one of said sashes, a lever engaging said dog, a slide-rod arranged in the other sash and adapted to register with and actuate said lever, and means for actuating said slide-rod, said window-frame having a recess adapted to receive the end of said slide-rod to lock the sash carrying said slide-rod, substantially as described.

702,701. CAR-BOLSTER. HARRY C. BUNCE, Chicago, Ill. Filed Mar. 14, 1902. Serial No. 96,299. (No model.)

Claim.—1. The combination of companion bolsters each having a central pot or cavity substantially within the normal lines of said bolsters, and an intermediate bearing element having a seat or bearing in each of said pots or cavities; substantially as and for the purpose specified.

2. The combination of companion bolsters each provided with a central cavity having spherical bearing-surfaces substantially within the normal lines of said bolsters, and an interposed spherical bearing element, substantially as and for the purpose specified.

3. The combination of companion bolsters having cavities whose bearing-faces are compounded of concentric spheres, and an interposed bearing element having corresponding surfaces, substantially as and for the purpose specified.

4. The combination with companion bolsters having cavities whose bearing-faces are spherical, of an interposed bearing element having the form of a sphere with radial projections therefrom, substantially as and for the purpose specified.

5. The combination with companion bolsters having cavities whose bearing-faces are spherical, of an interposed bearing element having the form of a sphere and intersecting cylinder, substantially as and for the purpose specified.

6. A cast-metal bolster having a centrally-disposed cavity or pot substantially within its normal lines and provided with spherical bearing-surfaces, the depth of said pot or cavity being substantially equal to the radius of curvature of the lowest part of said spherical bearing-surfaces, substantially as and for the purpose specified.

7. A cast-metal bolster having a centrally-disposed pot or cavity provided with spherical bearing-surfaces, the depth of said pot or cavity being substantially equal to the radius of curvature of the lowest part of said spherical bearing-surfaces, and also provided with a clearance-opening, substantially as and for the purpose specified.

8. A cast-metal bolster having a centrally-disposed pot or cavity provided with spherical bearing-surfaces, the depth of said pot or cavity being substantially equal to the radius of curvature of the lowest part of said bearing-surfaces, and also provided with spaced side bearing-plates concentric with said pot or cavity, substantially as and for the purpose specified.

9. A cast-metal bolster having a centrally-disposed bearing-cavity compounded of concentric spherical surfaces, substantially as and for the purpose specified.

10. A cast-metal bolster having a centrally-disposed bearing-cavity with spherical bearing-faces adjacent to the face of the bolster and a radially and laterally extending pocket; substantially as and for the purpose specified.

702,702. FRUIT-JAR. HENRY S. BROWN, New Orleans, La., assignor of one-fourth to Henry A. Brown, New Orleans, La. Filed Oct. 21, 1901. Serial No. 95,095. (No model.)

Claim.—In a fruit-jar, the combination with the neck having L-shape recesses in the inner side thereof, a top or cover having a portion which fits within the neck of the jar and provided with a flange which rests upon the neck and also provided with legs adapted to engage the L-shaped recesses, said lower portion provided with grooves extending from the lower edge thereof upward; of a rubber band placed over the joint between the top and neck, and a clamping-band placed over the rubber band, substantially as shown, the under side of the top or cover being convex.

702,703. LOOM-SHUTTLE. ELLISON GAMES, Williamsport, Pa., assignor to D. T. Dudley & Son Company, Williamsport, Pa., a Corporation of Massachusetts. Filed Dec. 11, 1901. Serial No. 95,699. (No model.)

Claim.—1. In a loom-shuttle, the combination of a shuttle-body provided with a recess, a spindle having a base and pivoted within said recess, the base of said spindle being provided with an extension, as a, in front of the pivotal connection of the spindle with the shuttle-body, and a heel as a', a spring-pressed pin having a head bearing upon the

heel, said pin having an offset or extension and an angular recess at the junction of the head and extension to engage the heel when the spindle is turned into the shuttle, the said offset or extension having an inclined surface to engage the base of the spindle when the latter is turned to its outward position.

2. In a loom-shuttle, the combination with the spindle, having its base pivoted within a recess in the shuttle-body, and an extension on the base in front of its pivot-point, to engage a wall of the recess, and an extension or heel back of the pivot-point, and a plane surface above said extension or heel, of a spring-actuated pin extending in a recess in the shuttle-body at the rear of the spindle, said pin having on its head or end, which engages the base of the spindle, an offset or extension having an inclined surface and forming a recess to receive the heel of the spindle, when it is in its lowered position, and the inclined outer or upper surface of the offset or extension adapted to engage the base of the spindle, when it is in its raised position, to limit the raising of the spindle, substantially as shown and described.

3. In a loom-shuttle, the combination with the spindle having its base pivoted within a recess in the shuttle-body, and an extension as a on the base in front of its pivot-point, to engage a wall of the recess, and an extension or heel a' back of the pivot-point, said base of the spindle having a forwardly-extending plane surface above said extension or heel, a, of a spring-actuated pin extending in a recess in the shuttle-body at the rear of the spindle, said pin having on its head or end, which engages the base of the spindle, an offset or extension forming a recess to receive the heel of the spindle, said offset or extension having an inclined surface to engage the spindle-base, and the projecting end of the offset or extension engaging the split part of the spindle, when it is raised, to hold it against the main part of the spindle, substantially as shown and described.

702,704. HANGER FOR PIPES, &c. ADOLPH R. CARL, New York, N. Y. Filed June 27, 1901. Serial No. 94,294. (No model.)

Claim.—1. In a hanger for pipes and analogous articles, a beam-clamp comprising a head having a transverse rectangular opening there-through, oppositely-disposed jaws having shanks slidably arranged in overlapping relation within the opening of the head, said jaws having their adjacent faces flattened and bearing against each other and their outer faces provided with longitudinally-disposed ribs, forming channels therebetween, and a set-screw threaded into the wall of the head and having its inner end located in the channel of the adjacent jaw-shank the ribs of the other shank bearing against the inner wall of the head opposite the set-screw whereby the shanks are held against rotary movement in the head.

2. In a hanger for pipes and analogous articles, the combination with a fastening element having an opening therein, said opening having an enlarged portion extending in from one end of the fastening element and a socket located at the inner end of and opening solely into said enlarged

portion, of a pipe-engaging element extending into the enlarged portion of the opening and having a shoulder that engages in the socket, and a supporting device for the fastening element, said device passing through the opening of the fastening element and bearing against that side of the pipe-engaging element which is opposite the shoulder to hold said shoulder in the socket.

3. In a hanger for pipes or analogous articles, the combination with a fastening element comprising a nut having a screw-threaded bore, an inclined counterbore concentric therewith extending into the nut from one end and an internal annular groove communicating with the inclined counterbore, of a pipe-engaging element consisting of a band, the opposite ends of which have offset studs that engage in the annular groove of the nut and are slidable laterally therein, and supporting means for the fastening element, said means including a screw-threaded chuck engaging in the bore of the nut and having a portion located in the counterbore between the terminals of the band to hold the offset studs thereof in the annular groove.

4. In a hanger for pipes or analogous articles, the combination with supporting means including a band having oppositely-disposed adjustable jaws, of a fastening element comprising a nut having a screw-threaded bore, an inclined counterbore concentric therewith extending into the nut from one end and an internal annular groove communicating with the inclined counterbore, a pipe-engaging element consisting of a band, the opposite ends of which are engaged in the counterbore and have offset studs that are located in the annular groove of the nut said ends being spaced apart, and slidable laterally in said groove, and a vertically-arranged hanger-rod having its opposite ends threaded, the upper end of said rod having a connection with the supporting-band, and the lower end being threaded in the bore of the fastening-nut and projecting into the counterbore thereof between the spaced terminals of the pipe-band.

702,705. FLOATING DREDGE. EPHRAIM GRASSETT, New Rochelle, N. Y. Filed Nov. 26, 1901. Serial No. 88,720. (No model.)

Claim.—1. A floating dredge provided with a longitudinal channel therethrough with its ends inclosed, a dredge-carriage moving on a suitable track extending along said channel near the water-line, a chain-bucket dredging apparatus and its operating mechanism supported on and carried by said carriage, and a dumping-upon or adapted to receive material from said chain-bucket dredge and convey it to the discharging apparatus, substantially as described.

2. A floating dredge provided with a dredge-carriage moving on a suitable track, means for driving said carriage, a chain-bucket dredging apparatus supported on and carried by said carriage, means for operating said chain-bucket dredging apparatus to perform the cutting operation, means for raising and lowering said chain-bucket dredging apparatus and adjusting the same to the required depth and angle of cut, and a ballast-car moving in unison with said dredge-carriage, substantially as set forth for the purpose set forth.

702,706. TYPE-WRITING MACHINE. GUSMAN W. CUTHMAN, Gaines City, Kan. Filed Nov. 5, 1901. Renewed Nov. 21, 1901. Serial No. 88,157. (No model.)

Claim.—1. In a type-writing machine, a base, a rack-bar thereon, a bed-plate longitudinally adjustable relatively to the base and provided with an opening, a frame mounted on the bed-plate and provided with an opening registering with that of the bed-plate, a second frame pivoted to work vertically in the first-named frame at one end, and yieldingly up-held, and provided with character-indicating points, a longitudinally-adjustable slide-plate mounted in said vertically-operating frame, a flexible type-bar secured to said plate, means for holding depressed that portion of the flexible type-bar which is vertically over the bed-plate opening, a key-lever also secured to said plate, a key on said lever, and adapted when registering with one of said character-indicating points to depress the corresponding character on the type-bar vertically over the bed-plate opening, and a dog pivotally depending from the said second frame and engaging said rack-bar, substantially as described.

2. In a type-writing machine, a base, a rack-bar thereon, a bed-plate longitudinally adjustable relatively to the base and provided with an opening, a frame mounted on the bed-plate and provided with an opening registering with that of the bed-plate and with an ink-pad at opposite ends of said opening, a second frame pivoted to work vertically in the first-named frame at one end and yieldingly up-held, and provided with character-indicating points, a longitudinally-adjustable slide-plate mounted in said vertically-operating frame, a flexible type-bar secured to said plate, means for holding depressed that portion of the flexible type-bar which is vertically over the bed-plate opening, a key-lever also secured to said plate, a key on said lever, and adapted when registering with one of said character-indicating points to depress the corresponding character on the type-bar vertically over the bed-plate opening, and a dog pivotally depending from the said second frame and engaging said rack-bar, substantially as described.

3. In a type-writing machine, a base, a frame movable longitudinally and laterally thereof and provided with an opening, a vertically-movable frame mounted on the first-named frame and provided with character-indicating points, means for holding said vertically-movable frame pressed yieldingly upward, a flexible type-bar adjustably mounted in the vertically-movable frame, and having one or more rows of type, and means, by reference to said indicating-points, to dispose any desired character on the type-bar vertically over the opening of said longitudinally-movable frame, substantially as described.

4. In a type-writing machine, a base, a frame movable longitudinally and laterally thereof and provided with an opening, means for yieldingly holding said frame in its forward position, a vertically-movable frame mounted on the first-named frame and provided with character-indicating

ing points, means for holding said vertically-movable frame pressed yieldingly upward, a flexible type-bar adjustably mounted in the vertically-movable frame, and having one or more rows of type, and means, by reference to said indicating-points, to dispose any desired character on the type-bar vertically over the opening of said longitudinally-movable frame, substantially as described.

5. In a type-writing machine, a base, a frame movable longitudinally and laterally thereof and provided with an opening, a spring holding said frame normally in its forward position, a vertically-movable frame mounted on the first-named frame and provided with character-indicating points, means for holding said vertically-movable frame pressed yieldingly upward, a flexible type-bar adjustably mounted in the vertically-movable frame and having one or more rows of type, and means, by reference to said indicating-points, to dispose any desired character on the type-bar vertically over the opening of said longitudinally-movable frame, substantially as described.

6. In a type-writing machine, a base, a rack-bar thereon, a bed-plate longitudinally adjustable relatively to the base and provided with an opening, a frame mounted on and pivoted to the bed-plate near one end, to work laterally, and provided with an opening registering with that of the bed-plate, a second frame pivoted to work vertically in the first-named frame adjacent to the pivotal point of connection of the latter with the bed-plate, and provided with character-indicating points, a longitudinally-adjustable slide-plate mounted in said vertically-operating frame, a flexible type-bar secured to said plate, means for holding depressed that portion of the flexible type-bar which is vertically over the bed-plate opening, a key-lever also secured to said plate, a key on said lever, and adapted when registering with one of said character-indicating points to depress the corresponding character on the type-bar vertically over the bed-plate opening, and a dog pivotally depending from the said second frame and engaging said rack-bar, substantially as described.

7. In a type-writing machine, a base, a rack-bar thereon, a bed-plate longitudinally adjustable relatively to the base, and provided with an opening, a frame pivoted near one end to the base and having a pin-and-socket connection with it at the opposite end, and provided with a registering opening and ink-pads at opposite ends of said opening, a second frame pivoted to work vertically in the first-named frame and provided with character-indicating points, a roller, and a dog, the latter engaging said rack-bar, a spring holding said frame normally elevated, a slide-plate mounted in said frame, a flexible type-bar connected at its opposite ends to said slide-plate and underlying said roller, a lever connected to said slide-plate and provided with a key at its free end to register with one or another of said character-indicating points, substantially as described.

8. In a type-writing machine, a base, a bed-plate having an opening, a frame upon the bed-plate and provided with a registering opening and with ink-pads, a second frame adapted to fold down into the first-named frame and provided with a longitudinal slot and character-indicating openings, a slide-plate fitting in said second frame, a flexible type-bar carried by the slide-plate, a roller depressing that portion of the type-bar which is vertically over the registering openings, a lever extending through said slot and secured to said slide-plate, and a key to engage one of the character-openings, and thereby depress the corresponding type of the type-bar over said registering openings, substantially as described.

702,707. CURTAIN-ROD. HENRIK F. CUNNINGHAM, PHILADELPHIA, Pa. Filed Apr. 22, 1901. Serial No. 84,014. (No model.)

Claim.—In combination with a curtain-pole, a series of spring-fingers rigidly attached at one end to the pole, the other end of said fingers being free and being curved outwardly from the pole, all of the fingers extending in longitudinal alignment with the pole and some of the fingers having their free ends extending in one direction and others in the opposite direction, said fingers adapted to engage intermediate of their ends with the fold of a curtain and clamp the same to the pole, substantially as described.

702,708. PROCESS OF MANUFACTURING SMOKING-PIPE. WALTER C. CUNNINGHAM, St. Paul, Minn., assignor to W. L. Cunningham, St. Paul, Minn., and Otto F. Higdon, Ottumwa, Iowa. Filed Mar. 21, 1902. Serial No. 88,342. (No model.)

Claim.—1. The herein-described improvement in the art of making open smoking-pipes, which consists in first molding a section of the bowl and its shank, subsequently molding the companion section of the bowl and its shank with its inner face against and in contact with the inner face of the section first molded, and finally separately uniting said sections in operative and complete form, substantially as described.

2. The herein-described improvement in the art of making open smoking-pipes, which consists in first molding a longitudinal half-section of the bowl and its shank, subsequently molding the companion half-section of the bowl and shank with its inner face against and in contact with the inner face of the section first molded, and finally separately uniting said sections in operative and complete form, substantially as described.

3. The herein-described improvement in the art of making open smoking-pipes, which consists in first molding a longitudinal half-section of the bowl and its shank, then molding the companion half-section of the bowl and shank with its inner face against and in contact with the inner face of the section first molded, then engaging the sections and hardened sections to an oil-bath, and finally separately uniting said sections in operative and complete form, substantially as described.

702,709. NON-REFILLABLE BOTTLE. GEORGE J. DAVIES, New York, N. Y. Filed Nov. 12, 1901. Serial No. 81,980. (No model.)

Claim.—1. The combination with the neck of a bottle having an enlarged recess therein, of a ring seated in said recess, a stopper-body adapted to engage said ring, a cage composed of gauze and having feet at its lower portion adapted to engage suitable recesses in said stopper-body, a valve-seat in the upper portion of said stopper-body, a valve-stem depending from said valve and a guide for said valve-stem, in combination with a spring interposed between the top of said valve and said cage, a wall of the latter serving as a strainer for the liquid contained in the bottle during the act of emptying the same.

2. In a non-refillable bottle, a stopper-body having an opening therethrough and a valve-seat in its upper portion, a stem depending from said valve, a guide within said stopper-body for said stem, a cage including said valve and consisting of a strip provided with feet at its lower portion, interlocking devices common to said feet and stopper-body and a frame-work covering supported on said strip, an extension projecting upwardly from said valve, and a spring surrounding said extension and interposed between said valve and the top of said cage.

3. In a non-refillable bottle, a stopper-body having an opening there-through and a valve-seat in its upper portion, a stem depending from said valve, a guide within said stopper-body for said stem, a cage inclosing said valve and consisting of a strip provided with feet at its lower portion, interlocking devices common to said feet and stopper-body and a frangible covering supported on said strip, an extension projecting upwardly from said valve, and a spring surrounding said extension and interposed between said valve and the top of said cage, in combination with the neck of a bottle having an enlarged recess therein, and a ring seated in said recess and supporting said stopper-body.

4. In a non-refillable bottle, a stopper-body having an opening there-through recess therein and a valve-seat in its upper portion, a stem depending from said valve, a guide for said stem, a cage inclosing said valve and consisting of a strip provided with enlarged feet at its lower portion which are adapted to engage and interlock with said recesses in said stopper-body, and a frangible covering supported on said strip.

5. In a non-refillable bottle, a stopper-body having an opening there-through recess therein and a valve-seat in its upper portion, a stem depending from said valve, a guide for said stem, a cage inclosing said valve and consisting of a strip provided with enlarged feet at its lower portion which are adapted to engage and interlock with said recesses in said stopper-body, and a frangible covering supported on said strip, in combination with the neck of a bottle having a recess therein and a ring seated in said recess and supporting said stopper-body.

6. In a non-refillable bottle, a stopper-body having an opening there-through, recess therein and a valve-seat in its upper portion, a cage inclosing said valve and consisting of a strip having feet interlocking with said recesses in said stopper-body and a frangible covering supported on said strip and inclosing said valve, said covering serving as a strainer during emptying of the bottle.

702,710. MECHANICAL CASHIER. MAAS & DENEHY, Chicago, Ill., and ARTHUR D. KING, Grand Rapids, Mich., assignors, by mesne assignments, to American Mechanical Cashier Company, a Corporation of New Jersey. Filed Jan. 4, 1901. Serial No. 48,081. (No model.)

Claim.—1. In a mechanical cashier, the combination with the cash-receipts, of a locking-dog preventing its operation in either direction, and a controller-key and an operating means, adapted to move the cash-receipts in opposite directions and both adapted to release the said dog to permit movement of the cash-receipts.

2. In a mechanical cashier, the combination with a cash-receipts and a casing having a cash-opening, of a controller-key arranged to engage the cash-receipts to move the deposited cash away from said opening and means for moving said receipt in reverse direction to move the deposited cash back to the opening.

3. In a mechanical cashier, the combination with a cash-wheel of a pivoted controller-key provided with a yielding portion arranged to engage the cash-wheel to move it in one direction of movement of the key,

but allow return movement of the key without operation of the cash-wheel, and means for moving the cash-wheel in the other direction independently of the controller-key.

4. In a mechanical cashier, the combination with a cash-wheel having teeth, of a pivoted controller-key-lever arranged to engage said teeth to turn the cash-wheel in one direction only, an operating device adapted to engage said teeth to turn the cash-wheel in reverse direction, and means for locking the cash-wheel from movement in either direction.

5. In a mechanical cashier, the combination with a cash-receipts wheel and means for moving same to expose or withdraw a receipt, of means for locking the cash-receipts wheel in the position to which it is moved.

6. In a mechanical cashier, the combination with a cash-receipts and locking means for same, of a controller arranged to move the cash-receipts and connected to the locking means to release same.

7. In a mechanical cashier the combination with a cash-wheel and a locking-catch engaging same, of a controller-key arranged to engage the locking-catch to release the cash-wheel and also adapted to engage the cash-wheel to move same after such release.

8. In a mechanical cashier, the combination with a cash-wheel and a locking-catch engaging same, of a controller-key arranged to engage the cash-wheel to move same and provided with a projection engaging the locking-catch and arranged to release the cash-wheel to allow it to be moved by the controller, and to then release the catch to allow it to again lock the cash-wheel.

9. In a mechanical cashier, the combination with a cash-receipts and a controller means adapted and arranged to move same in one direction, of operating means, separate from the controller means, for moving the cash-receipts in the other direction.

10. In a mechanical cashier, the combination with a cash-receipts and a casing having an opening opposite the cash-receipts, of a controller means adapted to move said receipts, away from said opening, and operating means, separate from the controller means for moving the receipts back to said opening.

11. In a mechanical cashier, the combination with a cash-receipts wheel and a controller means adapted to move same to withdraw a receipt thereof, of operating means, separate from the controller means to move the said wheel to expose such receipt.

12. In a mechanical cashier the combination with a cash-receipts, of controller means adapted to move the receipts in one direction, operating means separate from the controller means to move the said receipts in opposite direction, and locking means for said operating means controlled by the controller means.

13. In a mechanical cashier, the combination with a cash-receipts, controller means adapted to move the receipts to withdraw same, purchase-key mechanism, operating mechanism, separate from the controller means for moving the cash-receipts to expose same, and mechanism controlled by the controller means and by the purchase-key mechanism and controlling the operating mechanism.

14. In a mechanical cashier the combination with a cash-receipts wheel and its controller means adapted to move same in one direction, of an operating means separate from said controller means for moving said wheel in reverse direction comprising an operating shaft, an operating device loose on said shaft, clutching means for clutching said operating device to the shaft, and connecting mechanism whereby operation of said controller means controls the said clutching means.

15. In a mechanical cashier, the combination with a cash-receipts wheel, of an operating means for same, comprising a shaft, an operating device loose on said shaft and a clutching means for clutching said operating device to said shaft comprising a spring-pin on one of said parts adapted to engage the other part, and controlling means adapted to engage said spring-pin to control the engagement of said clutching means.

16. In a mechanical cashier, the combination with a cash-receipts wheel, controller means adapted to move said wheel in one direction and a purchase-key mechanism, of an operating device for the receipts-wheel in reverse direction, an actuating-shaft therefor, a clutch connection between said shaft and operating device, mechanism controlled by said controller and by the purchase-key mechanism and means controlled by the said mechanism to control the said clutch.

17. In a mechanical cashier, the combination with a cash-receipts wheel, of an operating means therefor comprising a shaft arranged to rotate in one direction only, and provided with an operating-handle, means operated by the rotation of said shaft to turn said cash-receipts wheel, a lock for said cash-receipts wheel and means controlled by said shaft to release said lock.

18. In a mechanical cashier, the combination with a cash-receipts wheel, of operating means therefor, comprising a shaft, a handle on said shaft and means operated by rotation of the shaft to turn the cash-receipts wheel, means for preventing backward movement of the shaft, a lock for said cash-receipts wheel and means controlled by said shaft to release said lock.

19. In a mechanical cashier, the combination with a cash-receipts wheel, of operating means therefor, comprising a shaft, a handle on said shaft and means operated by rotation of the shaft, to turn the cash-receipts wheel, pawl-and-ratchet means for preventing backward movement of the shaft, locking means for preventing movement of the cash-receipts wheel in either direction, and means controlled by the said shaft to release said locking means.

20. In a mechanical cashier, the combination with a cash-receipts wheel, of operating means therefor, comprising a shaft, a handle on said shaft and means operated by rotation of the shaft to turn the cash-receipts wheel, locking means for preventing such rotation of the shaft and means for releasing such locking means.

21. In a mechanical cashier, the combination with a cash-receipts wheel and purchase-key mechanism, of operating means for the cash-receipts comprising a shaft and means operated by rotation of said shaft to turn the cash-receipts wheel, detent means for preventing such rotation of the shaft and means operated by the purchase-key mechanism to release said detent means.

22. In a mechanical cashier, the combination with a cash-receipts wheel and a purchase-key, of operating means for the cash-receipts comprising a shaft and means operated by rotation of said shaft to turn the cash-receipts wheel, detent means for preventing such rotation of the shaft, a slide operating said detent means and a shaft provided with means adapted to engage the said slide and with means engaged by the purchase-key, to release the operating-shaft for the cash-receipts, upon operation of a purchase-key.

23. In a mechanical cashier, the combination with a plurality of cash-receipts wheels, of operating devices adapted to move the wheels to position for ejecting cash, and comprising an operating-shaft, operating devices loose on said shaft, and clutching means for connecting the said operating devices to said shaft, and ejecting devices operated independently and respectively by said operating devices.

24. In a mechanical cashier, the combination with a plurality of cash-receipts wheels, of an operating-shaft, and operating devices carried thereby and adapted to engage the cash-receipts wheels to move the same to ejecting position, and ejecting devices engaged respectively and operated independently by each operating device.

25. In a mechanical cashier, the combination with a cash-receipts wheel, of an operating-shaft and operating device carried loosely thereby and adapted to engage the cash-receipts wheel, clutching means adapted to connect said shaft and operating device, and a controlling device adapted to engage the said operating device to stop same and to engage the said clutching device to connect same.

26. In a mechanical cashier, the combination with a plurality of cash-receipts wheels, of operating devices adapted to move the said cash-receipts wheel to ejecting position, independent ejecting devices for the respective wheels, a shaft operating all of said ejecting devices, and clutch connection between said shaft and ejecting devices controlled by said operating devices.

27. In a mechanical cashier, the combination with a cash-receipts wheel and locking means therefor, of an operating-shaft, a cam operated by said shaft and means operated by said cam to release the aforesaid locking means, and an operating device also operated by said shaft and adapted to operate the cash-receipts.

28. In a mechanical cashier, the combination with the cash-receipts, its operating mechanism comprising a rotatable shaft and handle and purchase-key mechanism, of resetting means for the purchase-key mechanism, operating means for said resetting means and means carried by said rotatable shaft and engaging positively with each operating means to move it alternately in opposite directions in the rotation of the shaft.

29. In a mechanical cashier, the combination with the cash receiving and delivery mechanism, and the purchase-key mechanism, of resetting means for the purchase-key mechanism, a rotatable operating-shaft and means engaged positively by said shaft in its rotation to move the resetting means alternately in opposite directions.

702,711. PANEL-RAISER. LAWREN & BURR, Washington, Pa. Filed Aug. 31, 1901. Serial No. 73,008. (No model.)

Claim.—A panel-raiser comprising an approximate cylindrical body portion having a bore, and provided on its upper face with a central base,

curved arms formed integral with the said body portion at diametrically opposite points, said arms being substantially circular in cross-section, and a cutter-blade adjustably mounted on the inner edge of each arm and having their inner ends abutting against the said body portion, substantially as described.

702,712. APPARATUS FOR ATTACHING OR DETACHING HANDLES OF BRUSHES, BROOMS, OR THE LIKE. JOSEPH EATON, Haverhill, England. Filed Apr. 1, 1902. Serial No. 100,980. (No model.)

Claim.—The combination, with the handle or shaft *a* and the head *b* having socket *c*, of the metal cylinder or socket *d*, spindle *e*, metal cap-washer *f*, expanding washer *g*, and metal nut *h*, substantially as described, for the purpose specified.

702,713. APPARATUS FOR EXTINGUISHING FIRES IN CLOSED COMPARTMENTS. HENRY B. FISHER, Philadelphia, Pa. Filed Jan. 14, 1901. Serial No. 45,116. (No model.)

Claim.—1. The process of extinguishing fire in a closed compartment which consists in employing a liquefied combustion-non-supporting gas, changing the state of the same to a gas employing heat from the fire to assist in the evaporation of said gas and then introducing the gas into the compartment.

2. The process of extinguishing fire in a closed compartment, which consists in employing a liquefied combustion-non-supporting gas, evaporating the same in a proper evaporator, directing hot air from the compartment in which fire exists against a suitable portion of said evaporator to assist in the evaporation of said gas and introducing the gas into the compartment.

3. The process of extinguishing fire in a closed compartment, which consists in employing a liquefied combustion-non-supporting gas, changing the state of the same and discharging into an evaporator, directing

hot air from the compartment into the evaporator, and introducing the gas into the compartment.

702,714. PROCESS OF EXTINGUISHING FIRE IN CLOSED COMPARTMENTS. HENRY R. FISHER, Philadelphia, Pa. Filed Jan. 21, 1901. Serial No. 43,963. (No specimen.)

Claim.—1. The process of extinguishing fire in a closed compartment, which consists in employing a liquefied combustion-non-supporting gas, changing the state of the same to a gas in a suitable evaporator, using heat at a suitable point, creating a vacuum in the chamber, to assist in the evaporation, and then introducing said gas into the compartment.

2. The process of extinguishing fire in a closed compartment, which consists in employing a liquefied combustion-non-supporting gas, changing the state of the same to a gas in a suitable evaporator, using heat at a suitable point, creating a vacuum in the chamber, to assist in the evaporation, then introducing said gas into the compartment, removing said gas from said compartment, and then again introducing said gas into said compartment.

3. The process of extinguishing fire in a closed compartment, which consists in employing a liquefied combustion-non-supporting gas, changing the state of the same to a gas in a suitable evaporator, using heat at a suitable point, creating a vacuum in the chamber, to assist in the evaporation, then introducing said gas into the compartment, removing said gas from said compartment, then enriching the same by the addition of more gas, and then again introducing said gas into said compartment.

4. The process of extinguishing fire in closed compartments, which consists in employing a liquefied combustion-non-supporting gas, changing the same into a gas in an evaporating-chamber, whereby the temperature is reduced, then passing the gas around the exterior of the evaporating-chamber so that the temperature is still further reduced and then introducing the gas into the compartment.

5. The process of extinguishing fire in a closed compartment which consists in employing a liquefied combustion-non-supporting gas, changing the same into a gas, creating a vacuum during the said change of state, whereby a very low temperature is obtained and then introducing the gas into the compartment.

702,715. WEATHER-STRIP FOR DOORS. FREDERICK FISHER, Pittsboro, Wm., assignor of one-half to Charles Lister, Pittsboro, Wm. Filed Dec. 7, 1901. Serial No. 85,083. (No model.)

Claim.—A weather-strip for doors consisting of a hinged strip for the door-ill provided at one end with a tongue projecting beyond the edge of the strip, and a strip for the door having a downwardly-inclined portion provided on its under face near its opposite end with tongues spaced apart from the under surface of the strip, said tongues and the tongue of the door-strip being adapted to cooperate, substantially as described.

702,716. BOTTLE-CAPPING MACHINE. JOHN H. FOX, New York, N. Y. Filed Aug. 6, 1901. Serial No. 71,080. (No model.)

Claim.—1. The bottle-capping machine having a table for supporting the bottle, the socket *k* having recess *s* with its outer edge adapted to crowd inwardly the flange of the cap, the pivot *t* upon the face of the socket at one side of the recess, with the collar *r* pivoted thereon and movable laterally over the recess, and having central aperture *r'* a little smaller than the flange of the cap to sustain the cap when placed in the socket, and means for pressing the socket upon the bottle-mouth.

2. The bottle-capping machine having a table for supporting the bottle, the socket *k* having recess *s* with its outer edge adapted to crowd inwardly the flange of the cap, the pivot *t* upon the face of the socket at one side of the recess, with the collar *r* pivoted thereon and movable laterally over the recess, and having central aperture *r'* a little smaller than the flange of the cap to sustain the cap when placed in the socket, but such aperture being larger than the diameter of the cap after compression, whereby the bottle-neck may be inserted through the collar and withdrawn therefrom with the compressed cap thereon.

3. The bottle-capping machine having a table for supporting the bottle, the socket *k* having recess *s* with its outer edge adapted to crowd inwardly the flange of the cap, the pivot *t* upon the face of the socket at one side of the recess, with the collar *r* pivoted thereon and movable laterally over the recess, and having central aperture *r'* a little smaller than the flange of the cap to sustain the cap when placed in the socket, the stop-pin *u* upon the face of the socket to adjust the collar with its aperture *r'* concentric with the socket, and means for pressing the socket upon the bottle-mouth.

4. The bottle-capping machine having a table for supporting the bottle, the socket *k* having recess *s* with its outer edge adapted to crowd inwardly the flange of the cap, the pivot *t* upon the face of the socket at one side of the recess, with the collar *r* pivoted thereon and movable laterally over the recess, and having central aperture *r'* a little smaller than the flange of the cap to sustain the cap when placed in the socket, and the collar being sloped upon its inner side near the aperture *r'* to afford clearance for the flange of the cap when the collar is slid under the cap, substantially as herein set forth.

5. The bottle-capping machine herein shown and described, comprising the flat frame-plate *a* for attachment to the post, the table *c* secured upon each plate, the vertical guide *i* upon the top of the plate, the spindle *j* movable vertically in each guide and having the socket *k* upon its lower end with pivot *t* and stop-pin *u* upon the face of the socket, and collar *r* hinged upon each pivot with aperture *r'* concentric with the socket by the stop-pin, the shoulder formed upon the upper part of the spindle with spring *h* inserted between the shoulder and the guide *i*, and the hand-lever *p* pivoted to the spindle with link *q* hinging the same to the plate *a*, the whole being adapted to have the cap placed in the socket by hand, the collar turned to support the cap, the bottle sustained upon the table, and a cap attached to the bottle by depressing the hand-lever, substantially as herein set forth.

6. The bottle-capping machine herein shown and described, com-

prising the flat frame-plate *a* having upon its upper end the guide *i* with spindle *j* having socket to cap the bottle, and the table *c* with first *d* fitted to the frame-plate with bolts extended through the plate and the foot, and the foot having two vertical slots *e* with lateral recess *f* at coincident levels, to engage the bolts in specific positions of the table and to hold the table level in each position, substantially as herein set forth.

702,717. SALTS-INJECTOR FOR SIPHON-FILLING MACHINES. JOHN H. FOX, New York, N. Y. Filed Aug. 6, 1901. Serial No. 71,081. (No model.)

Claim.—1. In a siphon-filler having the post *a* with siphon-holder *c* movable vertically thereon and actuated by handle *t* and link *l*, the combination, with each part, of the supply-socket *p* attached to the top of the post by bent arm *g*, the valve-chamber *r* connected with the nozzle *r'*, the pump-cylinder *e* attached to the post below the collar *d* by clamp *f*, and having an inlet-pipe *o*, and an outlet having the pipe *o* connected with the socket *p*, the rod *g* of the pump-plunger projected downwardly from the cylinder, and the hand-lever *h* connected to each rod and projected past the post *a*, so and for the purpose set forth.

2. In a siphon-filler having the post *a* with siphon-holder *c* movable vertically thereon and actuated by handle *t* and link *l*, the combination, with each part, of the supply-socket *p* attached to the top of the post by bent arm *g*, the valve-chamber *r* connected with the nozzle *r'*, the pipe *o* provided with check-valve *s* opening toward the socket, the vertical pump-cylinder *e* attached to the post below the collar *d* by the clamp *f*, and having the arm *j* projected from its lower end with link *i* hinged thereto, the cylinder being provided with inlet-pipe *o* having check-valve *s* opening toward the cylinder and having its upper end connected with the socket *p* by the pipe *o*, the rod *g* of the pump-plunger projected from the lower end of the cylinder, the hand-lever *h* jointed to the rod and to the link *i*, and the spring *k* connecting the hand-lever and the arm to hold the pump-plunger normally raised, substantially as herein set forth.

3. The attachment herein shown and described for the siphon-filling machines having the post *a* with siphon-holder *c* movable vertically thereon and actuated by handle *t* and link *l*, and having the supply-socket *p* attached by the arm *g* to the top of the post, and provided with the valve *r*, the attachment comprising the vertical pump-cylinder *e* having the inlet-pipe *o* at the side and supply-pipe *o* at the top provided with check-valve *s* and adapted for connection with the top of the supply-socket, and having at one side the clamp *f* adapted to embrace the post below the sleeve of the siphon-holder, and at the opposite side the arm *j* provided with link *i*, the pump-plunger rod *g* projected from the bottom of the cylinder, the hand-lever *h* pivoted to the link *i* and to the rod *g*, and the spring *k* connecting the hand-lever and the arm to hold the pump-plunger normally raised, substantially as herein set forth.

4. The attachment herein shown and described for the siphon-filling machines having the post *a* with siphon-holder *c* movable vertically thereon, and having the supply-socket *p* with inlet for milk at the top and valve *r* at the side, and attached to the top of the post by the arm *g*, the attachment comprising the vertical pump-cylinder *e* having the inlet-pipe *o*, and the pipe *o* and check-valve *s* connecting the top of the pump with the top of the supply-socket, the pump having the clamp *f* for securing it upon the post, the pump-plunger projected downwardly from a cylinder, the hand-lever pivoted by link to the cylinder, and a stop upon the post projected in the path of the hand-lever to vary its stroke and the volume of milk delivered to the supply-socket, substantially as herein set forth.

702,718. CARBONATOR FOR BEVERAGES. JOHN H. FOX, New York, N. Y. Filed Oct. 17, 1901. Serial No. 79,051. (No model.)

Claim.—1. In a carbonator, the combination, with the shell *a* having water-inlet at the top, and provided with removable bottom having gas-inlet and water-outlet, of the series of perforated disks *n* each having its edge flanged and connected to a hoop *u* to strengthen the same, and the central rod and bushings to secure the disks together, substantially as herein set forth.

2. In a carbonator, the combination, with the shell *a* having water-inlet at the top, and provided with removable bottom having gas-inlet and water-outlet, of the series of perforated disks *n* having the flanges *n'* at the edges to space them apart, a spaced series of studs *r* soldered to each of the disks, and the bolt connecting the disks and having the bushings *s* fitted between the same, substantially as herein set forth.

3. In a carbonator, the combination, with the shell *a* having water-inlet at the top, and provided with removable bottom having gas-inlet and water-outlet, of the series of perforated disks *n* flanged at the edges to space them apart, and the stop *t* upon the shell *a* to contact with the upper disk and hold the series in place, substantially as herein set forth.

4. In a carbonator, the combination, with the shell *a* having water-inlet at the top and provided with removable bottom having gas-inlet and water-outlet and having a perforated grating secured just above the bottom, of the series of perforated disks *n* having the flanges *n'* at the edges to space them apart, the flange of the bottom disk resting upon the grating as set forth, and the bolt *g* connecting the disks and having the bushings *s* fitted between the same, and the nut for the bolt sustained above the grating by the flange of the bottom disk.

5. In a carbonator, the combination, with the shell *a* having water-inlet at the top, of the removable dish bottom having gas-inlet and water-outlet and provided with the perforated grating *t* forming chamber *q* next above the gas-inlet and water-outlet, and the series of perforated disks *n* having the flanges *n'* at the edges to space them apart, with bolt *g* and bushings *s* connecting the disks, and the flange of the bottom disk resting upon the grating, as set forth.

6. In a carbonator, the combination, with the shell *a* having water-inlet at the top and provided with removable bottom having gas-inlet and water-outlet and having a perforated grating secured just above the bottom, of the series of perforated disks *n* having the flanges *n'* at the edges to space them apart, and the bolt *g* to secure them together, and the gas-inlet pipe *f* extended from the bottom between the grating and the bottom disk and perforated to project the gas downwardly in the grating, so and for the purpose set forth.

7. In a carbonator, the combination, with the shell *a* having water-inlet at the top and provided with removable bottom having gas-inlet and water-outlet, with the series of perforated disks *n* having flanges *n'* at the edges to space them apart, of the strap *r* secured within the top of the

casing by the bolt *v* with its ends extended downward to the upper screen to hold the screens in place.

702,719. SODA-WATER-DISPENSING APPARATUS. CHARLES A. GEDDES, Philadelphia, Pa., assignor to George F. Laubenstein and William R. Boyer, Philadelphia, Pa. Filed Feb. 12, 1902. Serial No. 90,718. (No model.)

Claim.—1. In a dispensing apparatus, a plurality of syrup-receptacles, a casing having independent openings communicating with said receptacles, discharge-nozzles for said casing, a revoluble thimble within said casing having independent ports adapted to register with said openings and with one of said discharge-nozzles when the thimble is revolved, a revoluble hollow plug within said thimble having a port adapted to be moved into longitudinal alignment with all of said first-mentioned openings, another port in said plug adapted to register with said discharge-nozzle, a source of supply communicating with said casing by a plurality of ports, a port in said plug adapted to communicate with the interior of the plug, and a jet-passage extending from another port in said plug adapted to communicate with the other casing-part and having a port at its other end adapted to communicate with the other discharge-nozzle.

2. In a dispensing apparatus, a casing communicating with a plurality of syrup-receptacles and having discharge-nozzles, a revoluble hollow plug provided with ports, means for establishing communication between said plug and said syrup-receptacles and one of said discharge-nozzles, a source of supply adapted to communicate with the interior of said plug, and a jet-passage through said plug adapted to communicate at its opposite ends with a source of supply and with the other discharge-nozzle.

3. In a dispensing apparatus, a casing communicating with a plurality of syrup-receptacles and having discharge-nozzles, a hollow plug provided with ports within said casing, means for establishing communication between said receptacles and said plug and one of said discharge-nozzles, means for establishing communication between said plug and source of supply; an independent passage leading through said plug adapted to communicate at its ends with said source of supply and the other discharge-nozzle.

4. In a dispensing apparatus, a casing communicating with a plurality of syrup-receptacles and having a plurality of discharge-nozzles, a revoluble hollow plug within said thimble adapted to communicate with said syrup-receptacles, a port in said plug adapted to communicate with one of said discharge-nozzles, a jet-passage through said plug having a port adapted to communicate with the other of said discharge-nozzles, independent ports communicating with the source of supply and independent

ports in said plug communicating respectively with the interior of said plug and with said passage, and adapted to communicate with the independent ports communicating with source of supply.

5. In a dispensing apparatus, a casing communicating with a plurality of syrup-receptacles having a vent-port and a plurality of discharge-nozzles, a revoluble thimble within said casing having a plurality of ports to communicate with said syrup-receptacles and a plurality of vent-ports to communicate with the vent-ports of the casing, said thimble being also provided with a plurality of outlet-ports to communicate with the discharge-nozzles of said casing, a revoluble hollow plug situated within said thimble and having a longitudinal port to communicate with said inlet-ports of the thimble and having a vent-port to communicate with said vent-ports of the thimble, said plug being also provided with an outlet-port to communicate with one of said discharge-nozzles, an independent jet-passage through said plug having a port at one end to communicate with the other of said discharge-nozzles, and independent ports in said plug to communicate respectively with the interior thereof and with said passage and adapted to communicate independently with the source of supply.

6. In a dispensing apparatus, a casing having a tubular bearing and a flaring end portion, syrup-receptacles communicating with said flaring end portion, discharge-nozzles leading from said flaring end portion, a revoluble thimble mounted within said flaring end portion and having ports to communicate with said receptacles and with said nozzles, a revoluble hollow plug having a cylindrical portion mounted in said tubular bearing, a flaring portion situated within said thimble and provided with ports to communicate with the syrup-receptacles and with the discharge-nozzles, a closure secured to the flaring end portion of the casing and over the ends of said thimble and plug and means for establishing a communication between said plug and with source of supply.

702,720. MACHINE FOR HUSKING CORN. WILLIAM H. GUN-BAKER, Alton, Ill. Filed May 22, 1900. Serial No. 17,090. (No model.)

Claim.—1. In a husking-machine, a husking-roll having grippers mounted thereon and movable transversely to the periphery to permit one edge of the gripper to be projected while the opposite edge retreats whereby as one edge engages the ear of corn the opposite edge is projected to engage the butt-end of the ear of corn in the rotation of the roll, substantially as described.

2. In a husking-machine, a husking-roll provided with concave slidable grippers adapted in the rotation of the roll to have one edge of the gripper to retreat while the other edge is projected into engagement with the butt-end of the ear of corn in the rotation of the roll, substantially as described.

3. In a husking-machine, a husking-roll provided with grippers slidable transversely of its periphery with one free edge to be projected as the opposite edge retreats to adapt them by engagement of one edge with an ear of corn to have the other edge projected into engagement with the butt-end of the ear in the rotation of the roll, and a yielding roll arranged opposite to the first-named roll and adapted to exert a yielding pressure on the cornstalk in passing between the two rolls, substantially as described.

4. In a husking-machine, a husking-roll adapted in its rotation to have a part thereof engage the butt-end of the ear of corn, a yielding roll arranged opposite to the first-named roll and adapted to exert a yielding pressure on the cornstalk in passing between the rolls, and a third roll lying over the line of separation of said two rolls and adapted to press the ear of corn to one side as it is detached from the stalk, substantially as described.

5. In a husking-machine, a husking-roll provided with movable grippers adapted in the rotation of the roll to have one edge projected to engage the butt-end of the ear of corn, a yielding roll arranged opposite to said first-named roll and adapted to exert a yielding pressure on the cornstalk in passing between the rolls, and a third roll lying over the line of separation of said two rolls and adapted to press the ear of corn to one side as it is detached from the stalk, substantially as described.

6. In a husking-machine, a husking-roll adapted in its rotation to have a part thereof engage the butt-end of the ear of corn, a pressure-roll arranged opposite to the first-named roll, a third roll lying over the line of separation of said two rolls and adapted to press the ear of corn to one side as it is detached from the stalk, guides arranged in advance of said rolls to direct the stalk between the guides to the rolls, and an endless feed operating between said guides to act upon the stalks as they pass between the guides to the rolls, substantially as described.

7. In a husking-machine, a husking-roll adapted in its rotation to have a part thereof engage the butt-end of the ear of corn, a roll arranged opposite to the first-named roll, a third roll lying over the line of separation of said two rolls and adapted to press the ear of corn to one side as it is detached from the stalk, guides arranged in advance of said rolls to direct the stalk between the guides to the rolls, an endless chain or belt provided with fingers operating in the space between the guides, sprockets around which said endless belt or chain passes, one of said sprockets being arranged back of the forward ends of the rolls, and means for transmitting motion to one of said sprockets for the purpose of actuating the chain or belt, substantially as described.

8. In a husking-machine, a husking-roll adapted in its rotation to have a part thereof engage the butt-end of the ear of corn, a roll arranged opposite to the first-named roll, a third roll lying over the line of separation of said two rolls and adapted to press the ear of corn to one side as it is detached from the stalk, guides arranged in advance of said rolls to direct the stalk between the guides, an endless chain or belt provided with fingers operating in the space between the guides, sprockets around which said endless belt or chain passes, one of said sprockets having a bevel-gear connected therewith, and a bevel-gear connected with one of said rolls and meshing with the bevel-gear of the sprocket to transmit motion to the endless chain or belt, substantially as described.

9. In a husking-machine, a husking-roll adapted in its rotation to have a part thereof engage the butt-end of the ear of corn, a roll arranged opposite to the first-named roll, a third roll lying over the line of separation of said two rolls and adapted to press the ear of corn to one side as it is detached from the stalk, guides arranged in advance of said rolls to direct the stalk between the guides, an endless traveling feed operating in the space between the guides, a toothed wheel engaging with said traveling feed, a toothed wheel connected with the husking-roll and meshing with the toothed wheel of the endless feed, and a system of gears for transmitting motion from a driving-wheel to the husking-roll, substantially as described.

10. In a husking-machine, the combination of a husking-roll having its periphery provided with grippers adapted in the rotation of the roll to engage the butt-end of the ear of corn, a yielding roll arranged opposite to the first-named roll, said two rolls being spaced apart so as to permit a cornstalk to pass between them, a third roll lying over the line of separation of said two rolls and adapted to bear against and deflect to one side an ear of corn as it is covered from the stalk by the two first-named rolls, and a trough arranged to one side of said rolls to receive the detached ears of corn and have them pass through the same to a wagon-body or other receiver, substantially as described.

11. In a husking-machine two sets of husking-rolls arranged opposite to each other, the forward portion of one set of rolls being located at an angle of forty-five degrees in advance of the forward portion of the other set of rolls, that is, so that each set of rolls will operate in alternation on separate rows of stalks as the machine is moved forward, one roll of each set of rolls being provided with grippers mounted thereon to move transversely to the periphery of the roll, a trough for each set of husking-rolls arranged to receive the detached ears of corn from each set of rolls, and a trough arranged to receive the detached ears of corn from the troughs of the separate sets of rolls and deliver the corn into a wagon-body or other receiver, substantially as described.

12. In a husking-machine, two sets of husking-rolls arranged opposite to each other, the forward portion of one set of rolls being located at an angle other than forty-five degrees in advance of the forward portion of the other set of rolls, that is, so that each set of rolls will operate in alternation on separate rows of stalks as the machine is moved forward, one roll of each set of rolls being provided with grippers mounted thereon to move transversely to the periphery of the roll, a system of power-transmitting gears for each set of husking-rolls, and a power-transmitting wheel common to both sets of power-transmitting gears, substantially as described.

13. In a husking-machine, two sets of husking-rolls arranged opposite to each other, the forward portion of one set of rolls being located at an angle other than forty-five degrees in advance of the forward portion of the other set of rolls, that is, so that each set of rolls will operate in alternation on separate rows of stalks as the machine is moved forward, one roll of each set of rolls being provided with grippers mounted thereon to move transversely to the periphery of the roll, a trough for each set of husking-rolls arranged to receive the detached ears of corn from each set of rolls, and a trough arranged to receive the detached ears of corn from the troughs of the separate sets of rolls and deliver the corn into a wagon-body or other receiver, substantially as described.

14. In a husking-machine, two sets of husking-rolls arranged opposite to each other, the forward portion of one set of rolls being located at an angle other than forty-five degrees in advance of the forward portion of the other set of rolls, that is, so that each set of rolls will operate in alternation on separate rows of stalks as the machine is moved forward, one roll of each set of rolls being provided with grippers mounted thereon to move transversely to the periphery of the roll, a gear-wheel for one roll of each set of husking-rolls, shafts provided with wheels meshing with the wheels of the husking-rolls, one for each, sprocket-wheels mounted on said shafts, a power-transmitting wheel-shaft provided with sprocket-wheels, and chains connecting said sprocket-wheels with the sprockets of the first-mentioned shafts, substantially as described.

15. In a husking-machine, two sets of husking-rolls arranged opposite to each other, the forward portion of one set of rolls being located at an angle other than forty-five degrees in advance of the forward portion of the other set of rolls, that is, so that each set of rolls will operate in alternation on separate rows of stalks as the machine is moved forward, one roll of each set of rolls being provided with grippers mounted thereon to move transversely to the periphery of the roll, a trough for each set of husking-rolls extending substantially the length of said rolls and arranged to receive the detached ears of corn from each set of rolls, a trough arranged to receive the detached ears of corn from the troughs of the separate sets of rolls, an endless carrier for moving the ears of corn through the last-mentioned trough, mechanism for positively rotating one roll of each set of husking-rolls, and means for transmitting power from said mechanism to the endless carrier in the delivery-trough, substantially as described.

16. In a husking-machine, the combination with a wagon, of an independently-wheeled frame carrying husking-rolls, means for operably connecting the husking-rolls-carrying frame with the wagon, said means comprising slidably-connected members attached to the wagon and to said frame to adapt the frame to be tilted and to be adjustably connected to the wagon, a trough for delivering ears of corn from the husking-rolls to the wagon-body, and means for tilting the husking-rolls-carrying frame in its connection to the wagon, substantially as described.

17. In a husking-machine, the combination with the wagon, of an independently-wheeled frame carrying husking-rolls and provided with brackets having curved slots formed therein, rods connected with the wagon-body and passing through the curved slots of the brackets for connecting the wagon and husking-rolls frame together and permitting the frame to be moved in the arc of a circle, and means for adjusting said frame in relation to the wagon-body, substantially as described.

702,721. NUT-CRACKING MACHINE. ARTHUR GUNSMITH, Chicago, Ill., assignor of one-half to Leopold A. Dunn, Chicago, Ill. Filed May 16, 1901. Serial No. 90,331. (No model.)

Claim.—1. In a machine of the class described, the combination with a number of piston-heads, of a carriage in which said heads are loosely

mounted, means for imparting a forward-and-back movement to said carriage, and means for reciprocating said piston-heads independently of the movement of the supporting-carriage, substantially as described.

2. In a machine of the class described, the combination with a supporting-bed, of a carriage having a forward-and-back movement thereon, the piston-heads loosely mounted in said carriage and adapted to have both a movement with said carriage and a movement independent thereof, means for actuating the carriage, and means for reciprocating the piston-heads, substantially as described.

3. In a machine of the class described, the combination with a carriage provided with vertical slots and having a forward-and-back movement, of a number of piston-heads loosely mounted therein, a movement-plate mounted on said carriage, the companion fulcrum-levers, and the operative connection between the piston-heads, the movement-plate and said fulcrum-levers, substantially as described.

4. In a machine of the class described, the combination with a supporting-bed, of a traveling carriage provided with vertical slots, of a movement-plate, slotted in line with said vertical slots, the series of piston-heads, the screws or posts, inserted down through the slots in the carriage and movement-plate and fixed in the piston-heads, the fulcrum-levers pivoted at their longitudinal center to said carriage, the operative connection between said movement-plate and fulcrum-levers, whereby said piston-heads are retracted, and means for imparting a forward movement thereto, substantially as described.

5. In a machine of the class described, the combination with a supporting-bed, of a traveling carriage provided with vertical slots and seated on said bed, a movement-plate correspondingly slotted and loosely mounted on the traveling carriage and having an independent movement thereon, a number of piston-heads having a reciprocating movement in said carriage, the screws or posts inserted down through said slotted parts and fixed in the piston-heads, the companion fulcrum-levers pivoted at their outer ends to said carriage and the inner ends loosely engaging the movement-plate, means for advancing the piston-heads on their forward movement, and the operative connection for actuating the fulcrum-levers in returning said heads to their normal position, substantially as described.

6. In a machine of the class described, the combination with a traveling carriage, of the companion rods having their inner ends secured thereto and friction-rollers journaled in the outer ends thereof, a counter-shaft D, the companion cams mounted thereon and adapted once in each revolution, to engage said rollers and impart a forward movement to said carriage, and means for returning the same to its normal position when said cams have passed out of contact, substantially as described.

7. In a machine of the class described, the combination with a traveling carriage, of a number of piston-heads, adapted to have a reciprocating endwise movement thereon, the locking-plungers inserted from the under side of said carriage in line with each of the piston-heads, and means for periodically throwing said plungers into and out of engagement with said heads, substantially as described.

8. In a machine of the class described, the combination with a traveling carriage provided with apertures starting in from the under side, a number of piston-heads loosely mounted in said carriage, the locking-plungers inserted in said apertures, a yoke, a transverse bar having its respective ends loosely inserted in the open ends of said yoke and in which the lower stem ends of said plungers are secured, and means for rocking said yoke in throwing said plungers into and out of engagement with the stems to said piston-heads, substantially as described.

9. In a machine of the class described, the combination with a yoke, comprising companion side bars, provided with slots in their open ends, and an upturned stem end, a transverse bar, having its respective ends loosely inserted in said slots, a plurality of vertically-moving plungers, having their lower ends secured in said transverse bar, the series of piston-heads, with which said plungers are adapted to periodically engage and lock the same against an endwise movement, and means for imparting a rocking movement to said yoke, substantially as described.

10. In a machine of the class described, the combination with the piston-heads, the plurality of locking-plungers, the tilting yoke, the yoke-actuating cam, the shaft on which said cam is mounted, and means for returning said yoke to its normal position when the actuating-cam rolls out of contact, substantially as described.

11. In a machine of the class described, the combination with a carriage having a forward-and-back movement, of a number of crushing-heads adjustably mounted therein, the companion rods having their inner ends secured to said carriage and provided with friction-rollers in the outer disengaged ends, the companion cams having two contacts with said rollers in each revolution and imparting two distinct forward movements to said carriage with a pause between said movements, and means for returning the carriage to its normal position, substantially as described.

12. In a machine of the class described, the combination with a supporting-bed, of a traveling carriage mounted thereon, the crushing-heads, inserted in said carriage and in line with the piston-heads opposite there-

to, the companion cams, the operative connection between said carriage and cams, whereby said cams are adapted to have two advancing contacts with said carriage in each revolution, the cam-shaft, and means for returning said carriage to its normal position, substantially as described.

13. In a machine of the class described, the combination with a supporting-bed, of the companion carriages located thereon and having a reciprocating movement toward and away from each other, a number of piston-heads loosely mounted in one of said carriages, means for temporarily locking the piston-heads against a back movement when the limit of their forward movement is reached, a number of crushing-heads rigidly mounted in the companion carriage, means for advancing said companion carriage to its forward position step by step, and means for returning the carriage to its normal position, substantially as described.

702,722. HEATING-FURNACE. WILLIAM GORHAM, PITTSBURG, Pa. Filed Nov. 21, 1901. Serial No. 83,121. (No model.)

Claim.—1. In a heater, the combination of a base having formed therein an annular recess, a cylindrical casing seated in said recess having formed therein an air-inlet, a removable base arranged above said casing having formed therein a series of openings, a burner secured in said removable base, an outer casing secured above said casing, a water-compartment extending into said outer casing, an inner casing forming a combustion-chamber, a deflector arranged at the upper end of said inner casing, a radiating-pipe communicating with said combustion-chamber arranged above said inner casing, a removable hood, a deflector secured at the upper end of said hood, a series of distributing-pipes communicating with said hood, all parts being arranged substantially as described.

2. In a heater, the combination of an inner and outer casing, a series of tapering air-pipes arranged around said inner casing, a burner, a grate or basket secured to the upper face of said burner, refractory material arranged in said grate or basket, a deflector arranged at the upper end of said inner casing, a radiating-pipe communicating with said combustion-chamber, a suitable hood, and a series of distributing-pipes extending from said hood, substantially as described.

3. In a heater, the combination of a suitable support having formed therein an annular recess, an annular casing seated in said recess having formed therein an air-opening, a removable base-plate arranged to support said casing having formed therein a series of openings, a burner arranged in said base-plate, a deflector secured in said burner, a grate having arranged therein refractory material secured above said burner, an inner and outer casing, a series of tapering air-pipes arranged around said inner casing, a deflector secured to the upper end of said inner casing, a radiating-pipe secured upon said inner casing and communicating therewith, a hood carrying a deflector, and a series of distributing-pipes connected to said hood, substantially as described.

702,723. CURTAIN-POLE. LOUIS J. GRAY, PITTSBURG, Pa. Filed Dec. 4, 1901. Serial No. 84,846. (No model.)

Claim.—1. A curtain-pole comprising two metal sections one having an elongated spring-pocket and the other having a tongue for engagement in said pocket, flanges formed integral with said sections between which the curtain is held, and means for securing the sections in a locked position, substantially as described.

2. A hollow metallic curtain-pole comprising a male and a female section, the female section having a spring-pocket throughout its length at the upper edge, and the male section having a tongue for engagement in said pocket, and flanges carried by said sections between which the curtain is held, substantially as described.

3. A hollow metallic curtain-pole comprising a male and a female section the female section having its upper edge bent upon itself to form a pocket and the male section having an inclined tongue for frictionally engaging with the walls of said pocket, means carried by said sections at their lower edges for securing the curtain, and means engaging the ends of the sections for securing same in a locked position, substantially as described.

702,724. GARMENT-FASTENER. GEORGE W. OWEN, BALTIMORE, Md., assignor to the Raymond Button Company of Baltimore City, a Corporation of Maryland. Filed Nov. 7, 1901. Serial No. 81,447. (No model.)

Claim.—1. In a garment-fastener, the combination with a stud member comprising a hollow post having an outwardly-projecting annular recessed flange at its lower end and its upper end split into a plurality of branches curved over to form a resilient head, of a socket member adapted to be sprung over the resilient head of the stud member and having a flange at its upper end and its lower end upturned and adapted to rest in the recess in the outwardly-projecting flange of the stud member, as and for the purpose described.

2. In a garment-fastener, the combination of a stud member comprising a hollow post having an outwardly-projecting annular recessed flange at its lower end and provided with a number of holes, and its upper end split into a plurality of branches and curved over to form a resilient head, of a socket member having an annular flange at its upper end and provided with a number of holes and its lower end upturned and adapted to rest in the annular recess in the outwardly-projecting flange of the stud member, as and for the purpose described.

702,725. ELECTRIC CONDUCTING-WIRE. HERMAN HANSEN, FAIRFAX AND ROBERT HANSEN, FAIRFAX, New York, N. Y. Filed Feb. 26, 1902. Serial No. 82,104. (No model.)

Claim.—1. An insulated electric conductor, consisting of a wire, and a covering layer formed of strands of filaments consisting solely of open glass braided on said wire, substantially as set forth.

2. An insulated electric conductor, consisting of a wire, a plurality of covering layers formed of strands of filaments consisting solely of open glass braided on the same, and intermediate braided layers of textile threads, substantially as set forth.

702,726. AUTOMATIC BALANCE OR SCALE. ERIC S. HENMAR, STOCKHOLM, Sweden. Filed Jan. 11, 1902. Serial No. 82,265. (No model.)

Claim.—1. In a balance or scale, the roller, the track for it to roll on, means which compel the roller to move along the track when it rotates, the eccentric secured to and forming part of said roller, the combined roller and eccentric having their common center of gravity at the axis of the roller, and the flexible, depending connector over and attached at one end to said eccentric, substantially as set forth.

2. In a balance or scale, the roller, the inclined track for the roller to move over, means which compel the roller to move along said track when it rotates, the eccentric secured to and forming a part of said roller, said roller and eccentric being so mounted that a plane passing through their centers will be substantially horizontal when the roller is at rest at its lowest point, and the strap over and attached at one end to said eccentric and dependent at the other end to receive the article to be weighed, substantially as set forth.

3. In a balance or scale, a cylindrical roller, an inclined track for the roller to move over, means consisting of straps which compel the roller to move along the track when it turns about its axis, a circular or cylindrical part fixed to the roller in a manner to form an eccentric thereon, and a strap over said eccentric, secured to the latter at one end and depending from the periphery of the eccentric at the other end to support the article to be weighed, substantially as set forth.

4. In a balance or scale, a cylindrical roller, an inclined track for said roller, means which compel the roller to move over the track when it rotates, an eccentric on said roller, and a strap over said eccentric, one end of which depends from the periphery of the eccentric to support the object to be weighed, the other end being secured to the eccentric, the common center of gravity of the combined roller and eccentric being at the axis of the former, and the inclination of the track being just sufficient to compensate for the lateral movement of the supporting-strap as the eccentric rotates, substantially as set forth.

5. In a balance or scale, the combination with a circular eccentric, a flexible connector over the periphery of same, said connector being secured at one end to the eccentric and depending from the periphery of same to support the object to be weighed, and means compelling said eccentric to rise bodily when it is rotated by the descent of the object being weighed, the eccentric having its center of gravity at its center of rotation, substantially as set forth.

702,727. STRAM DOGGING-MACHINE. ARTHUR S. HILL, Kalamazoo, Mich. Filed June 26, 1901. Serial No. 83,057. (No model.)

Claim.—1. The combination with a steam-cylinder, two pistons working therein, each respectively actuated, a piston-rod connected to each piston, a pair of sliding jaws, means connecting each jaw to one of said piston-rods, a steam-chest and appropriate parts, a valve mechanism as described whereby the steam-pressure in said cylinder may be controlled.

2. In a steam dogging-machine, the combination of means for supporting and causing logs to travel longitudinally, a pair of steam-actuated jaws adapted to reciprocate transversely on straight lines and grasp the log between them, and means for controlling the application of steam thereto.

3. The combination of two movable jaws adapted to approach or recede from each other, a steam-cylinder located adjacent to said jaws, double pistons in said cylinder, and means connecting each of said pistons respectively with each of said jaws, and means for controlling the inlet and outlet of steam therefrom.

4. In a steam digging-machine, the arrangement and combination of two movable jaws adapted to approach and recede from each other transversely on straight lines, the inner faces of said jaws being so constructed that their lower portions approach more nearly than the upper portions, means on said jaws to engage the logs to be operated upon and means for actuating said jaws.

702,728. SUBMARINE BOAT. JOHN P. HOLLAND, Newark, N. J., assignor to Electric Boat Company, a Corporation of New Jersey. Filed Oct. 2, 1900. Serial No. 31,574. (No model.)

Claim.—1. A submarine vessel designed to float on an even keel when running on the surface of the water, having the center of volume of the emerged portion of its body situated forward of the center of buoyancy of the vessel, to counterbalance the weight of the bow-wave tending to depress the boat at the stem, and having water-ballast tanks of which the center of gravity is placed forward of the center of buoyancy of the vessel such a distance that the volume of the water-ballast tanks, multiplied by the distance of their center of volume forward of the vessel's center of buoyancy when the water-ballast tanks are empty, is equal to the volume of the emerged portion of the vessel's body multiplied by the distance of its center of volume forward of the vessel's center of buoyancy under the same conditions, whereby, when said tanks are filled for diving, the buoyancy of said emerged portion may be neutralized and the boat brought with its longitudinal axis substantially parallel with the surface of the water, for the purpose set forth.

2. A submarine vessel designed for operation both on and under the surface of the water, and having water-ballast tanks of capacity for sinking it to the crash condition, said vessel having its center of gravity situated, when said tanks are empty, aft of the center of buoyancy, and said tanks being of such capacity as, when they are filled, to put the vessel on an even keel, substantially as set forth.

702,729. SUBMARINE BOAT. JOHN P. HOLLAND, Newark, N. J., assignor to Electric Boat Company, a Corporation of New Jersey. Filed Oct. 2, 1900. Serial No. 31,575. (No model.)

Claim.—In a submarine boat, the combination with water-ballast means having a fixed capacity to contain just sufficient water to overcome the normally emerged portion of the boat, less the reserve buoyancy, of the means for propelling and steering the boat, whereby the boat may be made to dive, to run while submerged, and return to the surface without varying the amount of water-ballast.

702,730. PURIFYING RAW INDIGO. BENNO HEDDLE, Frankfurt-on-the-Main, Germany, assignor to Farbwerke, vorm. Meister, Loeb & Co., Höchst-on-the-Main, Germany, a Corporation of Germany. Filed Oct. 15, 1901. Serial No. 73,955. (No specimens.)

Claim.—The herein-described process of purifying raw indigo, which consists in extracting raw indigo with pyridin bases, substantially as set forth.

702,731. ORE-POCKET. FRANK K. HOOPER, Kansas City, Mo., and ARTHUR J. MARSH, Chicago, Ill. Filed June 18, 1901. Serial No. 68,111. (No model.)

Claim.—1. An ore pocket or hopper having converging front and rear walls, in combination with a roller journaled below the same and forming a movable bottom wall for the discharge-outlet, the rear wall of the hopper extending substantially into contact with the periphery of the roller, and the front wall terminating above the roller below the line marking the natural angle of repose of the material operated upon and at a distance from the nearest point on the periphery of the roller which is substantially equal to the distance between such lower termination of the front wall and the nearest point on the opposite rear wall, substantially as described.

2. An ore pocket or hopper having front and rear walls converging to a discharge-outlet, in combination with a roller journaled below the same and forming a movable bottom wall for the hopper, the rear wall of the hopper extending substantially into contact with the periphery of the roller and the front wall terminating above the roller and at a minimum distance from the periphery thereof which is approximately equal to one-third the diameter of the roller, and which is also substantially equal to the transverse dimension of the opening between such lower termination of the front wall and the nearest point on the opposite rear wall, substantially as described.

3. An ore pocket or hopper having front and rear walls converging to a discharge-outlet, in combination with a roller forming a bottom wall for said hopper, the rear wall of the hopper extending substantially into contact with the upper face of the roller, and the front wall terminating at a distance above the roller such as to provide discharge-openings of substantially equal cross-sectional area between the bottom of the front wall and the nearest points on the rear wall and roller, respectively, substantially as described.

4. An ore pocket or hopper having converging front and rear walls and a lateral discharge, one of said walls being provided above the discharge-outlet with a lever, said lever being located at such point in the wall above the discharge-outlet as to prevent the arching of the material within the hopper, substantially as described.

5. An ore pocket or hopper having a discharge-outlet at its bottom and a lever opening in one of its walls above the discharge-outlet and a movable wall forming a bottom wall for the discharge-outlet, adapted when at rest to retain the material within the hopper and when in motion to withdraw the material from the hopper and to discharge it laterally through said outlet, substantially as described.

6. An ore pocket or hopper having a discharge-outlet at its bottom and a lever opening extending across the discharge side above said opening and a roller located in and forming the bottom wall of the outlet and upon which the material runs and adapted when moved to withdraw the material from the hopper and discharge it laterally through said outlet, substantially as described.

7. An ore pocket or hopper having formed on its lower contracted end a discharge-outlet and means for effecting the discharge of material therefrom, in combination with a series of bars disposed over the mouth of the hopper and serving to break the impact of material delivered to the hopper, to prevent the admission thereto of any masses of material

too large to pass through the discharge-outlet and to retain the same thereon until broken up or removed, substantially as described.

702,732. CIRCULAR GLASS-CUTTER. DAVID R. JOHNSON, Allentown, Pa. Filed Sept. 25, 1901. Serial No. 74,558. (No model.)

Claim.—1. In a circular glass-cutter, a rotatable block, a bolt having a head fitted to slide in said block, a base, a chuck passing freely through said block, and head, a handle on said chuck, and a center-carrying arm adjustably fitted in a slot in said head, said block having a groove in its side in register with said slot of the bolt-head.

2. A circular glass-cutter, comprising a handle, a chuck extending therefrom, a base upon the said chuck, a frictional centering-plate upon said base, a center rotatably mounted upon said chuck, a block mounted on said chuck, a bolt having its head adapted to slide in said block, and a center-carrying arm adjustably fitted in said head and adapted to be carried by said head against said block, said bolt and block having openings for the free passage of said chuck therethrough.

3. A circular glass-cutter, comprising a handle having a centering-plate connected therewith by a chuck, a rotatable block mounted upon said chuck, and provided in its side with a guide-groove, an arm adjustably secured in said groove and provided with a glass-cutter, a bolt having a head adapted to slide in said block and provided with a slot in which said arm is adjustably received, said chuck passing freely through said block and head, and means for moving said bolt and carrying said arm into said groove.

4. A circular glass-cutter, comprising a handle having a centering-plate connected therewith by a chuck, a block rotatably mounted upon said chuck and provided with a guide-groove, a bolt passing through said block and having a slot registering with said guide-groove, a thumb-screw upon said bolt adapted to engage said block, and an arm passing through said guide-groove and slot and provided with a glass-cutter.

5. A circular glass-cutter comprising a handle, a chuck, a centering-plate, said chuck connecting said handle and plate, a longitudinally-moving arm having a center, said arm being rotatably mounted on said handle, a block mounted on said chuck, a bolt having its head adapted to slide in said block, said arm being passed through a slot in said head, and said chuck passing freely through said block and head, and means on said bolt whereby said arm is carried against said block.

6. A circular glass-cutter, comprising an arm having a centering-plate connected therewith by a chuck, a block rotatably mounted upon said chuck and movable longitudinally thereon, an arm connected with said block and having a glass-cutter, a bolt having its head adapted to slide in said block and carrying said arm and a tightening-nut fitted on the threaded end of said bolt and adapted to engage said block.

702,733. WITHDRAWN.

702,734. ELECTRIC WATER-RECORDING DEVICE. WILLIAM H. KIMM and ALFRED THOMSEN, New York, N. Y. Filed Mar. 15, 1901. Serial No. 51,512. (No model.)

Claim.—1. In an electric water-recording device, the combination of a water-supply pipe with an electric-circuit-closing device consisting of an electroconducting body, arms extending from said body, guide-arms provided with openings in which said arms fit and having their free ends connected in an electric circuit.

2. In combination, a water-supply, arms extending into and out of said supply, an electric-circuit closer mounted between the arms inside

the supply-pipe, and electrical connections with the outside ends of said arms for operating an indicator and to ring an alarm.

702,735. REVOLVER. HENRY M. KOLS and CHARLES FORBES, Philadelphia, Pa. Filed Sept. 23, 1901. Serial No. 74,954. (No model.)

Claim.—1. In a revolver, a cylinder rotatably mounted upon an arm, a link pivotally connected with the barrel of the revolver, and a pivot connecting said link and arm, the same being eccentric to said arm.

2. In a revolver, an arm upon which the cylinder is rotatably mounted, said arm being provided with an offset, and a link pivotally connected with the barrel of the revolver and pivoted to said offset.

3. In a revolver, an arm upon which the cylinder is pivotally mounted, an offset at the forward end of said arm, a link pivoted upon the barrel and pivotally connected with said offset, said link being recessed to receive the end of said arm, and the forward portion of the frame of the revolver being recessed to receive said arm.

4. In a revolver, a tubular arm upon which the cylinder is rotatably mounted and a pivotally-mounted member pivotally connected with said arm, an ejector-plate at the rear end of said cylinder carried by a tube situated within said tubular arm, said tube being longitudinally movable within said arm, a spring situated between said cylinder and tube for moving the tube in one direction, a locking-pin passing through said tube and arm, said locking-pin and tube being capable of a limited relative longitudinal movement, said cylinder, tube and pin being held against relative rotation, and a socket in the frame of the revolver to receive said pin.

5. In a revolver, a tubular arm upon which the cylinder is rotatably mounted and a pivotally-mounted member pivotally connected with said arm, an ejector-plate at the rear end of said cylinder carried by a longitudinally-movable tube situated within said arm, a spring situated

6. In a revolver, a tubular arm upon which the cylinder is rotatably mounted and a pivotally-mounted member pivotally connected with said arm, an ejector-plate at the rear end of said cylinder carried by a longitudinally-movable tube situated within said arm, a spring situated

between said tube and cylinder for moving the former in one direction, a locking-pin passing through said arm and tube, legs upon said locking-pin situated within slots in said tube, said cylinder, tube and pin being held against relative rotation, and a socket in the frame of the revolver to receive said pin.

7. In a revolver, a frame, a cylinder, an ejector, a pin extending through said ejector and adapted to lock said cylinder to said frame, a slotted tube through which said arm passes and legs on said pin engaging in said slots and a spring adapted to return said ejector to its normal position after the shells have been removed and by engagement with the legs on said pin causing the same to lock the cylinder to said frame when the parts are in proper position.

8. In a revolver, a frame, a cylinder, a tube having slots near its rear end, a pin movable in said cylinder and having legs moving in said slots, an ejector carried by said tube at its rear end, the cylinder having notches at its end, a flange on the forward end of the said tube, a spring around the tube and a ring, between which said flange, said spring is disposed.

702,786. APPARATUS FOR REDUCING FUSIBLE MATERIALS TO DUST. ALBERT F. MARSH, Newark, N. J. Filed May 14, 1900. Serial No. 717,083. (No model.)

Claim.—1. A machine for converting fusible material into dust, comprising a rotary vessel having unobstructed peripheral openings, means for heating said vessel above the melting-point of the fusible material and means for rotating said vessel at a speed sufficient to spray the melted material from the peripheral openings into the form of dust.

2. An apparatus for converting a fusible material into dust, comprising a rotary vessel having unobstructed peripheral openings, means for heating the vessel above the melting-point of the fusible material, means for supplying the melted fusible material to the vessel and means for rotating said vessel at a speed sufficient to cause spraying of the melted material from such openings in the form of dust.

3. A machine for converting fusible material into dust, comprising a rotary vessel having unobstructed peripheral openings, means for heating said vessel, means for rotating said vessel at a speed sufficient to spray the melted material from the peripheral openings into the form of dust, and a casing surrounding said vessel.

4. A machine for converting fusible material into dust, comprising a rotary double-cone-shaped vessel, mounted on a shaft arranged in line with the cone-axis, and provided at its periphery with openings to permit passage of the fused material and having an axial opening through which each material may be supplied, means for heating said vessel, and means for rotating said vessel at a speed sufficient to spray the melted material from the peripheral openings into the form of dust.

5. An apparatus for converting fusible material into dust, comprising a rotary vessel perforated to allow of the discharge of melted mate-

rial therefrom, means for supplying melted material to said vessel, means for heating said vessel, means for rotating said vessel to cause the melted material to be ejected through the perforations of the vessel at a sufficient speed to cause spraying of the same, an insulating casing and means for passing a current of air or gaseous medium through said casing to entrain the dust particles suspended therein.

6. An apparatus for converting fusible material into dust, comprising a rotary vessel perforated to allow of the discharge of melted material therefrom, means for supplying melted material in said vessel, means for rotating said vessel to cause the melted material to be ejected through the perforations of the vessel at a sufficient speed to cause spraying of the same, an insulating casing and means for passing a current of air or gaseous medium through said casing to entrain the dust particles therein, and a dust-separator for separating the dust so entrained from the entraining-air.

7. An apparatus for converting fusible material into dust, comprising means for melting such material, spraying means for converting the melted material into impalpable dust, air-draft apparatus for producing a current of air to entrain the dust suspended in such air, a separator for separating the dust from the entraining-air, a chamber and means for discharging the separated dust into such chamber, and for breaking up the vertical air-current to enable the dust to settle.

8. The combination with a machine for converting fusible material into dust, of air-draft apparatus for entraining the dust, a settling-chamber, a centrifugal dust-separator communicating with such air-draft apparatus and having a contracted mouth communicating with such chamber, a rotatable obstructing device in proximity to such mouth, and means for rotating same, substantially as and for the purpose set forth.

9. The combination with a machine for converting fusible material into dust, of air-draft apparatus for entraining the dust, a settling-chamber, a centrifugal dust-separator communicating with such air-draft apparatus and having a contracted mouth communicating with such chamber, a rotatable obstructing device in proximity to such mouth, and means for rotating same, substantially as and for the purpose set forth.

10. The combination with a machine for converting fusible material into dust, of air-draft apparatus for entraining the dust, a settling-chamber, a centrifugal dust-separator communicating with such air-draft apparatus and having a contracted mouth communicating with such chamber, a rotatable obstructing device in proximity to such mouth, and means for rotating same, in opposite direction to the vertical movement in the separator, substantially as and for the purpose set forth.

702,787. BADGE-MEDALLION. JOHN E. MILLER, Denver, Colo. Filed Oct. 14, 1901. Serial No. 73,577. (No model.)

Claim.—In a badge-medallion, the combination with a badge, of a single piece of sheet metal, comprising a concavo-convex disk, stamped out of sheet metal and having its peripheral edge bent upon itself toward the convex side of said disk to form an inverted rim integral with the back, in combination with a flexible transparent disk of celluloid or other suitable material secured against the convex side of said disk by said inverted integral rim, and tongue portions stamped free from said concavo-convex disk, and arranged and adapted to be inserted through and fastened to said badge, substantially as described.

702,788. FLEXIBLE HOSE ADAPTED FOR COUPLINGS. GEORGE M. HALL, MONTGOMERY, Philadelphia, Pa. Filed Aug. 13, 1901. Serial No. 71,914. (No model.)

Claim.—1. A pipe-coupling consisting of a rubber tube combined with a flexibly-flexible metallic coil yieldable in all directions without material resistance and embedded within the rubber walls of the tube so as to be wholly covered, the said coil permitting the tube to collapse when necessary without injury to said tube or coil.

2. A rubber-tube coupling combined with a spiral textile tube encircling the rubber tube and wholly embedded within the rubber of the tube and also terminating at a considerable distance from each end thereof, and a flexible metallic cable incased within the spiral textile tube and thereby held out of contact with the rubber of the tube and leaving the ends of the rubber tube without metal.

2. A pipe-coupling consisting of a rubber tube combined with a metallic coil of twisted wire coiled into a helix and wholly embedded in the walls of the rubber tube.

702,789. PENHOLDER. ROBERT L. MOTT, Chicago, Ill. Filed Apr. 17, 1902. Serial No. 168,284. (No model.)

Claim.—1. A penholder comprising an oval handle conforming to the oval between the thumb and first finger when in proper position for writing, so as to sit in between them; capped for their reception and to maintain its position without lateral slip; elastic to permit flexion, and provided at the end of the finger branch with a socket for the reception of a pen.

2. The improved penholder having a curved elastic base conforming to the bend of the hand of thumb and forefinger when in proper position for writing, a thumb branch extending out from the lower end of the curve and capped and spirally twisted for the reception of the thumb, a longitudinally-capped finger branch terminating in a deep cup for the fingertip, and a socket for the pen projecting from said terminal cup.

702,740. INKING DEVICE FOR TYPE-WRITING MACHINES. FREDERICK F. HILMAN, JEROME, N.Y. Assignor, by mesne assignments, to the Union Typewriter Company, Jersey City, N. J., a Corporation of New Jersey. Filed Dec. 2, 1900. Serial No. 738,940. (No model.)

Claim.—1. A type-writing machine provided with an inking device, comprising a pivoted fountain having an ink-pad, a spring tending to move said fountain away from the path of the types, and a releasable locking device for locking the fountain against the action of the spring and holding it in the path of the type-bars, whereby when the locking device is released by the impact of the type-bars against the fountain, the fountain will be moved out of the path of the type-bars, substantially as described.

2. A type-writing machine, provided with an inking device comprising a fountain having an ink-pad, a rock-shaft upon which the fountain is secured, a spring tending to cause said shaft to move the fountain away from the path of the types, a releasable locking-lever, and means secured to the shaft and with which the lever engages to hold the fountain in the path of the type-bars, substantially as described.

3. A type-writing machine, provided with an inking device comprising a fountain having an ink-pad, a rock-shaft upon which the fountain is secured, a disk on one end of the shaft, a spring tending to move said disk and cause the fountain to be moved away from the path of the type-bars, and a spring engaging this disk to hold the fountain in the path of the type-bars, substantially as described.

4. A type-writing machine provided with an inking device, comprising a fountain having an ink-pad, a shaft carrying the fountain, a spring-pressed disk held on the said shaft and having a notch, and a spring having a leg engaging the said notch for locking the disk and fountain in place, substantially as shown and described.

5. A type-writing machine provided with an inking device comprising a fountain having an ink-pad, a shaft carrying the fountain, a spring-pressed disk held on the said shaft and having a notch, a spring having a leg engaging the said notch for locking the disk and fountain in place, and means for returning the said disk and controlled from the keys, substantially as described.

6. A type-writing machine, provided with an inking device comprising a fountain having an ink-pad, a shaft carrying the fountain, a disk on the said shaft, a bell-crank lever adapted to engage a pin on the said disk, a connection between the said bell-crank lever and the keys, and a spring pressing the said disk, substantially as shown and described.

7. In a type-writing machine, the combination with the type-bars mounted to swing to bring the type to a common center on the impression-roller, of a pivoted fountain having an ink-pad, a spring tending to move said pad away from the path of the types, and a releasable locking device for locking the fountain in the path of the type-bars, and means for returning the fountain to its normal position after it has been struck by the type-bars and moved thereby out of the path of the same, substantially as shown and described.

8. In a type-writing machine, the combination with the keys, and type-bars mounted to swing to bring their types to a common center on the impression-roller, of a rock-shaft, a fountain having an ink-pad and secured to the shaft, a disk on the shaft a spring engaging the disk to hold the fountain in the path of the type-bars, a spring-pressed bell-crank lever engaging the said disk, and means for operating the bell-crank lever from the keys, substantially as described.

9. In a type-writing machine, the combination with the keys and type-bars mounted to swing to bring their types to a common center on the impression-roller, of a rock-shaft, a fountain on the shaft, and having an ink-pad, a notched disk on the end of the shaft, a spring-pressed bell-crank lever engaging a pin on the said disk, and intermediate mechanism between the keys and bell-crank lever for operating the latter from the former, substantially as shown and described.

10. In a type-writing machine, the combination of a series of type-bars, a series of keys, a piston, inking mechanism arranged near the piston and normally in the path of the types, means for moving said inking mechanism and holding it out of contact with said type-bars while the types are making their impressions, and means for returning said inking mechanism to normal position.

11. In a type-writing machine, the combination of a series of type-bars, a series of key-levers, a universal bar operated by said levers, an inker normally in the path of said type-bars, and operative connections from said universal bar to said inker.

12. In a type-writing machine, the combination of a series of type-bars, a series of keys, an inker arranged in the path of the type-bars, means controlled by the type-bars for moving said inker out of its normal position, and means controlled by said keys independently of said type-bars for returning said inker to normal position.

13. In a type-writing machine, the combination of a series of type-bars, a series of keys, an inker arranged in the path of the type-bars and constructed to be moved by any of said bars during their printing strokes, and mechanism connecting said keys to said inker independently of said type-bars for returning the latter to normal position.

14. In a type-writing machine, the combination of a type, a key, an inker arranged in the path of the type and constructed to be moved by the type during the printing stroke of the latter, and mechanism connecting said key to said inker independently of the type for returning the said inker to normal position during the return of said key to normal position.

702,741. DETACHABLE FASTENING FOR VACCINATION. RICHARD E. OLIVER, Newark, N. J. Filed Nov. 4, 1901. Serial No. 80,886. (Specimens.)

Claim.—1. The combination, with a vaccination or analogous shield having holes at opposite ends for the passage of a fastener, of separate adhesive tapes having non-corrosive metallic fasteners with heads upon the adhesive sides of the tape and prongs projected outwardly through the tape, and engaged with the holes at the opposite ends of the shield, whereby the shield can be repeatedly engaged with and disengaged from the prongs without disturbing the tapes when once attached to the skin of the patient.

2. The combination, with an aluminum vaccination or analogous shield having holes at opposite ends for the passage of a fastener, of separate adhesive tapes having non-corrosive metallic fasteners with heads upon the adhesive sides of the tape and prongs projected outwardly through the tape and engaged with the holes at the opposite ends of the shield, whereby the shield can be repeatedly engaged with and disengaged from the

prongs without disturbing the tapes when once attached to the skin of the patient.

3. The combination, with a vaccination or analogous shield, having holes near its opposite edges to receive fasteners as set forth, of a pair of straps for securing the shield in place, and aluminum fasteners of staple shape having the bar *f* crossing a part of the strap and their arms *g* inserted through the holes in the shield and bent upon its surface, whereby the strap is securely held, and the part of the fastener upon the adhesive side of the tapes in contact with the skin is of non-corrosive character.

702,742. SLIDING DOOR FOR RAILWAY CARS. JOHN FLAYER, Topeka, Kans. Filed Jan. 20, 1902. Serial No. 93,574. (No model.)

Claim.—1. In combination, a car-body having a door-opening, a sliding door therefor, a pair of interlocking strips one thereof being secured to the bottom of the door and the other thereof being secured to the car-body.

2. In combination, a car-body having a door-opening, a sliding door therefor, a pair of interlocking strips, one thereof being channelled, one of said strips being secured across the bottom of the door and the other strip being secured to the car-body below the door-opening.

3. In combination, a car-body and a sliding door, a depending strip secured to the body and below the car-door opening, and an elongated strip secured to the door along the bottom thereof and extending upwardly behind the first-named strip.

4. In combination, a car-body and a sliding door, a strip secured to the car-body across and below the doorway and having one edge spaced apart from the body, and a U-shaped strip of a length substantially that of the width of the door and secured to the inner face thereof and including the first-named strip between its flanges.

5. In combination, a car-body and a sliding door, a U-shaped strip secured to the inner face of the door across its bottom and having its flanges upturned, and a strip secured to the car-body across the doorway, its lower edge projecting into the channel of the first-named strip.

6. In combination, a car-body having a door-opening, a sliding door therefor the bottom of which projects below the door-opening and is spaced from the car-body, a depending strip secured to the body across and below the door-opening and having its lower edge located between the bottom of the car-door and the car-body and spaced apart from the body, and an elongated U-shaped strip secured through one of its flanges to the inner face of the door and including the first-named strip between its flanges, the other of said flanges extending into the space between the car-body and the strip secured thereto.

702,743. BICYCLE CONSTRUCTION. JOHN C. PRATT, Hartford, Conn., assignor of one-half to Arthur L. Foster, Hartford, Conn. Filed May 7, 1901. Serial No. 90,097. (No model.)

Claim.—1. The combination with the frame member of a bicycle in which the saddle-post is secured, of a pump of which said frame member constitutes the body, a piston-rod in the pump, the outer end of which normally projects beyond the upper end of the frame member, means to depress and lock the rod within the said frame member and means to eject the said rod when it is released.

2. The combination with the frame member of a bicycle in which the saddle-post is secured, of a pump of which said frame member constitutes the body, a piston-rod in the pump the outer end of which projects beyond the upper end of the frame member, a saddle-bar pivotally supported on the said post and unattached to the pump-rod and adapted to be swung over the said rod to depress and hold it within the pump and means to eject the rod when the seat is swung out of engagement therewith.

3. The combination with the frame member of a bicycle, of a pump of which said frame member constitutes the body, of a pump therein, a pump-rod comprising telescopic sections, suitable screw-threads on said sections, a partition in said pump-body through which said rod passes, lugs on the partition, and lugs on one of the pump-rod sections to engage the lugs on the partition, whereby one of said sections may be held against rotation and the sections screwed together.

4. The combination with a frame of a bicycle, one of whose members constitutes a pump-body, of a pump therein, a pump-rod comprising telescopic sections, suitable screw-threads on said parts, radial projections on one of the sections, a partition through which the pump-rod passes, said partition comprising upper and lower plates spaced apart to provide a chamber, pins in the chamber and radial slots in the lower plate to per-

mit the pins on the pump-rod to enter the chamber and be lodged against the pins therein, whereby the said rod is held against rotation and the parts may be screwed together.

5. The combination with a frame member of a bicycle, in which the saddle-post is secured, of a pump of which said frame member constitutes the body, a fixed transverse partition in said frame member, a pump-rod extending through said partition and consisting of several sections adapted to be contained in said member, a spring on said partition for engaging with said rod, whereby the latter may be forced into said member against said spring, and the rattling of the parts be thereby prevented, and means for locking said sections temporarily in said member, substantially as described.

702,744. RAILWAY REPLACING-FROG. ALEXANDER FURLEY, St. Paul, Minn. Filed July 30, 1901. Serial No. 70,807. (No model.)

Claim.—1. A railway replacing-frog, consisting of a guide-head sloping downward toward each of its ends and the rail, a cap on the lower side of said head adapted to engage the head of the rail, and a guideway, at the base of said guide-head, sloping upward from the ends of the frog to the top of the rail adapted to form a runway for the car-wheel and to guide the wheel onto the rail.

2. In a railway replacing-frog, a guide-head sloping downward toward each of its ends and the rail, a cap on the lower side of said head, adapted to engage the head of the rail, a shoulder on said guide-head sloping upward from its ends toward the top of the rail, and a bearing-surface at the base of said shoulder, sloping downward from the top of the cap to the ends of the head.

702,745. AUTOMATIC SWITCH-THROWING DEVICE. JOHN H. QUINN, Cincinnati, Ohio. Filed Mar. 2, 1902. Serial No. 97,231. (No model.)

Claim.—1. A switch mechanism adapted to throw a switch-rail into or out of contact with the main rail, comprising a housing, a sliding frame therein movable to and from the track, a switch-lever, a bar connected thereto and to the frame, a switch-bar connected to the switch-rail, pivotal connections between the last-named switch-bar and the sliding frame forming a break-joint by means of which the switch can be thrown independent of the sliding frame and mechanism for actuating the said break-joint, substantially as described.

2. A railroad-switch comprising a main rail and a switch-rail adapted to be moved into and out of contact therewith, a switch-lever, a sliding frame actuated thereby movable in a direction to and from the main

rail, members pivoted on said sliding frame and connected to said switch-rail, rigid in a direction of movement of said sliding frame and movable in a direction transverse thereto, a trip device adapted to be actuated by the moving train, and connections between said trip device and one of said pivotal members mounted on said sliding frame whereby the switch can be closed independent of said switch-lever, substantially as specified.

3. A railroad-switch comprising a main rail and a switch-rail adapted to be moved into and out of contact therewith, a switch-lever, a sliding frame movable toward and from the main rail, a bar connecting said sliding frame to the switch-rail, a second bar connecting the said sliding frame to the switch-lever, pivotal connections on said sliding frame connecting said sliding frame to the bar attached to the switch-rail, said pivotal connections being rigid in a direction of movement of the said sliding frame and adapted to yield to a strain in a direction transverse thereto, to throw the switch-rail independent of the movement of the sliding frame, a trip device adapted to be actuated by the moving train, and connections between the said trip device and pivotal members mounted on the sliding frame, whereby the switch can be closed independent of the position of said switch-lever, substantially as specified.

4. In combination with a railroad-switch and switch-stand operating a sliding frame to throw the switch, a switch-closing mechanism comprising a switch-bar, a lever pivoted thereto and to the sliding frame detachably connected to the switch-stand lever and a tripping mechanism adapted to engage said pivoted lever and connected to an actuating device alongside of the track in advance of the switch whereby said pivoted lever may be operated from the train to close the switch when partially or fully open, substantially as specified.

5. In combination with a switch-stand lever a sliding frame and a switch-bar, a lever pivoted to said sliding frame and to the switch-bar, and detachably connected with the switch-stand lever, a tripping mechanism detachably engaging with said pivoted lever and adapted to be operated independent of the switch-stand for closing the switch, substantially as specified.

6. In combination with a switch and switch-bar connected to an intermediate sliding frame of a lever pivoted to said sliding frame and to the switch-bar, mechanism for holding said pivoted lever into right position against the throwing strain of the switch-stand lever, substantially as specified.

7. The combination with a sliding frame forming the operating parts of a switch-stand of a lever pivoted to said sliding frame and detachably connected to the switch-stand lever, mechanism for holding said pivoted lever against movement on its pivot, a stop on the frame-bed for locking said lever in position when the switch is closed and tripping mechanism for releasing said lever when the switch is partially open and bringing into engagement a tripping mechanism whereby said lever can be thrown

to close the switch by mechanism independent of the switch-stand, substantially as specified.

8. In combination with a sliding frame adapted to be operated by a switch-stand lever, of a switch-closing mechanism consisting of a lever pivoted to said sliding frame, an arm carrying a tripping device adapted to engage said lever when said sliding frame is moved forward, locking devices affixed to the pivoted lever and to the sliding frame with the parts so disposed that they will engage and lock said lever when the switch is closed, by said tripping-arm thereby requiring a resetting of said pivoted lever before said sliding frame can be operated, substantially as specified.

9. In combination with a switch-bar, a switch-stand and its operating-lever, of a sliding frame intermediate thereof, a lever pivoted to the sliding frame and to the switch-bar and detachably connected to the switch-stand lever, a tripping-arm intermediate of the parts of said sliding frame provided with means for engaging said pivoted lever and having connection with actuating mechanism independent of the switch-stand for operating said pivoted lever to close the switch, and mechanism for locking said lever in position after the switch has been closed by said tripping-arm, substantially as specified.

10. The combination with a switch-bar, a switch-stand and a sliding frame operated by the switch-stand lever, of a switch-closing lever pivoted to the said sliding frame and to the switch-bar, a tripping-arm adapted to be engaged with said pivoted lever, an extended rod connected to an actuating lever located alongside of the track and mechanism adjacent to said track connected to said actuating-lever adapted to be operated from a moving train and throw said lever on the sliding frame to close the switch, substantially as specified.

11. In combination with a sliding frame operated by a switch-stand lever, of a lever pivoted to said sliding frame and to the switch-bar, a tripping-arm operated by an actuating-lever located alongside of the track in front of the switch-stand, means located adjacent to the track for operating said actuating-lever whereby the switch may be closed by moving said actuating-lever independent of the switch-stand, substantially as specified.

12. A switch mechanism adapted to throw a switch-rail into or out of contact with the main rail comprising a housing, a sliding frame therein movable to and from the track, a switch-lever, a bar connected thereto and to the frame, a switch-bar connected to the switch-rail, pivotal connections between said switch-bar and the sliding frame forming a break-joint by means of which the switch can be thrown independent of the sliding frame, mechanism adapted to break said joint and close the switch, and locking means located in the housing adapted to be automatically engaged by one of said pivotal members when the joint is broken, whereby the switch is locked in its closed position, substantially as described.

13. A switch mechanism adapted to throw a switch-rail into or out of contact with the main rail comprising a housing, a sliding frame therein movable to and from the track, a switch-lever, a bar connected thereto and to the frame, a switch-bar connected to the switch-rail, pivotal connections between said switch-bar and the sliding frame forming a break-joint by means of which the switch can be thrown independent of the sliding frame, mechanism adapted to break said joint and close the switch, and locking means located in the housing adapted to be automatically engaged by one of said pivotal members when the joint is broken, whereby the switch is locked in its closed position, and a slot in the side of said housing allowing a portion of one of the said pivotal members to project externally when the break-joint is operated thereby indicating that the joint has been broken, substantially as described.

14. In combination with a switch-operating mechanism, an independent safety-trip therefor, consisting of a base-plate located adjacent to the track, a lever pivoted to the base-plate opposing one of the tracks and adapted to be actuated by the moving train, a connecting-rod parallel to the track for transmitting motion to the switch-operating device and a bell-crank lever pivoted respectively to said base-plate, to said trip-lever and to said connecting-rod, the said bell-crank being shaped and fulcrumed so as to form a positive limit to the throw of the connecting-rod, substantially as described.

15. In combination with a switch-operating mechanism, a bed-plate, a toggle-lever having its ends pivoted to the bed-plate and its middle joint flared toward one of the track-rails, means for holding said central joint normally in its position, the said central joint normally in this position, the said central joint forming an abutment adapted to be actuated by a moving train in a direction to and from the rail, a connecting-rod leading from the bed-plate to the switch-operating mechanism, movable in a direction parallel to the track, a bell-crank lever the middle joint of which is pivoted to the bed-plate, one of the ends of said bell-crank lever being pivoted to the end of the connecting-rod, and a link pivoted respectively to the other end of said bell-crank lever and to the said central joint of the toggle-lever, the said bell-crank lever being shaped and fulcrumed to limit the length of throw of the connecting-rod irrespective of the length of throw of the said central joint of the toggle, substantially as described.

702,746. CASKET-HANDLE ATTACHMENT. HARRY RIBSEL, Pontiac, Ill. Filed Nov. 23, 1901. Serial No. 93,341. (No model.)

Claim.—The casket-handle attachment comprising the plate A, with opening at bottom to admit hook M; with opening at top to admit part of plate U, and catch E, to hold leg in place, and with spring H, to secure catch E.

702,747. COG-WHEEL. FRANK BAXON, Worthington, Minn. Filed Feb. 8, 1902. Serial No. 93,136. (No model.)

Claim.—1. A compensating cog-wheel, comprising an outer section having a series of teeth and an annular inwardly-projecting flange on one side, an inner section fitting within said outer section and having a corresponding outwardly-projecting flange on the opposite side from said first-named flange between which flange chambers are formed, inwardly and outwardly projecting lugs provided respectively on said sections, and cushion-springs provided between the lugs of each section and the adjacent lugs of the other section.

2. A compensating cog-wheel, comprising an outer section having a series of teeth and a series of inwardly-projecting lugs, an inner section fitting within said outer section and having a series of outwardly-projecting lugs alternating with those of the outer section, a series of cushion-springs provided between the lugs of one section and the adjacent lugs of the other section, beveled pinions provided within recesses in said inner section, and radial pins passing through the lugs and hub of said inner section and whereon said pinions are mounted.

3. A compensating cog-wheel, comprising an outer section having a series of teeth and a series of inwardly-projecting lugs, an inner section arranged within said outer section and having a series of lugs alternating with the lugs of the outer section, springs provided between the lugs of said sections and adapted to be compressed by the relative rotary movement of the same, and studs provided on the lugs of the inner section and adapted to travel within slots in the face of the outer section and regulate the travel of said sections and the compression of said springs.

4. A compensating cog-wheel, comprising an outer section having a series of teeth and a series of inwardly-projecting lugs, an inner section fitting within said outer section and having a series of lugs alternating with the lugs of the outer section, cushion-springs provided between the lugs of said sections and adapted to be compressed by the relative rotary movement of the same, pinions provided within recesses in said inner section, radial pins passing through the lugs and hub of said inner section and whereon said pinions are mounted, and bolts adapted to travel in slots provided in said outer section and passing through the lugs and pins of said inner section and whereby the relative movement of said sections and the compression of said springs is regulated.

702,748. TYPE-WRITING MACHINE. CHARLES H. SHEPARD, Brooklyn, N. Y., assignor to Wyckoff, Seamans & Benedict, Inc., N. Y., a Corporation of New York. Filed Apr. 1, 1901. Serial No. 93,048. (No model.)

Claim.—1. In a type-writing machine, the combination of a carriage, an escapement-rack, a yielding dog normally disengaged from the rack, means for moving said dog into engagement with the rack, means

for preventing said dog from yielding under the pressure of the rack, and an air-check for releasing said dog.

2. In a type-writing machine, the combination of a carriage, an escapement-rack, a yielding dog normally disengaged from the rack, means for moving said dog into engagement with the rack, a catch for preventing said dog from yielding under the pressure of the rack, and a retarding device connected with said catch and which may operate automatically to withdraw said catch so that the dog may yield under the rack-pressure.

3. In a type-writing machine, the combination of a carriage, an escapement-rack, a yielding dog normally disengaged from the rack, a catch for preventing said dog from yielding under the pressure of the rack, and an air-check connected to said catch so as to cause it to release said dog during a quick movement of the latter into engagement with the rack.

4. In a type-writing machine, the combination of a carriage, an escapement-rack, a key-controlled rocker, a yielding dog carried by said rocker and normally disengaged from the rack, a catch upon said rocker for preventing the dog from yielding under the pressure of the rack, and an air-check for releasing said catch.

5. In a type-writing machine, the combination of a carriage, an escapement-rack, a key-controlled rocker, a yielding dog carried by said rocker and normally disengaged from the rack, a catch upon said rocker for preventing said dog from yielding under the pressure of the rack, and an air-check mounted upon the framework of the machine and connected to said catch so as to cause the latter to release the dog when said rocker is quickly actuated.

6. In a type-writing machine, the combination of a carriage, an escapement-rack, a key-controlled rocker which vibrates transversely of the rack, a dog independently movable upon said rocker and normally disengaged from the rack, means for preventing independent movement of said dog, and an air-check for releasing said dog.

7. In a type-writing machine, the combination of a carriage, an escapement-rack, a rocker which vibrates transversely of said rack, two yielding dogs mounted upon said rocker, means for preventing one of said dogs from yielding under the pressure of the rack, and an air-check for releasing said dog.

8. In a type-writing machine, the combination of a carriage, an escapement-rack, a rocker which vibrates transversely of the rack, a dog pivoted upon an axis transversely to the rocker-axis and normally disengaged from the rack, a catch, controlled by an air-check, for both supporting said dog during a slow movement of the rocker and releasing said dog during a quick movement of the rocker, and a spring for returning said dog to normal position upon said rocker.

9. In a type-writing machine, the combination of a carriage, an escapement-rack, a rocker vibrating transversely of said rack, a dog pivoted upon said rocker and normally disengaged from the rack, a catch also mounted upon said rocker for preventing a pivotal movement of said

dog, a spring for maintaining the connection of said catch with said dog, and an air-check mounted upon the framework of the machine and connected to said catch.

10. In a type-writing machine, the combination of a carriage, an escapement-rack 6, feeding-dog 23 normally engaging said rack, rocker 30 upon which said feeding-dog is mounted, spring-actuated dog 25 normally disengaged from said rack and mounted upon arm 26 which is pivoted upon said dog-rocker, tooth 29 upon said arm, catch 30 pivoted upon said dog-rocker and engaging said tooth, spring 33 mounted upon said rocker and actuating said catch, cylinder 42 mounted upon the framework of the machine, and piston 41 connected to said catch and working in said cylinder.

11. In a type-writing machine, the combination of a carriage, an escapement-rack 6, feeding-dog 23 normally engaging said rack, rocker 30 upon which said feeding-dog is mounted, spring-actuated dog 25 normally disengaged from said rack and mounted upon arm 26 which is pivoted upon said dog-rocker, tooth 29 upon said arm, catch 30 pivoted upon said dog-rocker and engaging said tooth, spring 33 mounted upon said rocker and actuating said catch, cylinder 42 mounted upon the framework of the machine, piston 41 in said cylinder, lever 37 mounted upon the framework of the machine and connected to said piston, and link 34 connecting said lever to said catch.

12. In a type-writing machine, the combination of a spring-propelled carriage, an escapement-rack, a yielding dog normally disengaged from the rack, a cooperating dog normally engaged with the rack, means for moving said yielding dog into engagement with the rack and simultaneously moving the other dog out of engagement with the rack, and adjustable means for causing said normally-disengaged dog either to withstand the rack-pressure, thus affording a natural feed of the carriage, or to yield under the rack-pressure, thus affording a reverse feed of the carriage, the range of adjustment being such as to enable the mechanism to afford either a natural feed at all speeds of operation or a reverse feed at all speeds of operation, or an automatically-convertible feed.

13. In a type-writing machine, the combination of a carriage, an escapement-rack, a key-controlled rocker which vibrates transversely of the rack, cooperating dogs upon said rocker, and adjustable means for causing said dogs to afford either a natural feed at all speeds of operation or a reverse feed at all speeds of operation, or an automatically-convertible feed.

14. In a type-writing machine, the combination of a carriage, an escapement-rack, a dog normally engaging the rack, a yielding dog normally disengaged from the rack, means for moving said yielding dog into engagement with the rack and the other dog out of engagement with the rack, a catch for preventing said yielding dog from yielding under the rack-pressure, and adjustable means for releasing said catch, the construction being such that said catch is released or not according to the rate of speed at which the mechanism is operated, and the release being effected at lower or higher speed according to the adjustment.

15. In a type-writing machine, the combination with a carriage, of an escapement-rack, a key-controlled rocker vibrating transversely of said rack, cooperating dogs upon said rocker, one of which is yielding, a catch for preventing said yielding dog from yielding under the rack-pressure, and adjustable means for releasing the dog from said catch, the construction being such that the dog is released or not according to the speed of operation of the rocker, and the release being effected at lower or higher speed according to the adjustment.

16. In a type-writing machine, the combination of a carriage, an escapement-rack, a yielding dog normally disengaged from the rack, means for moving said dog into engagement with the rack, a catch or lock for said dog, an air-check for releasing said dog from the control of said catch or lock, and an adjustable vent for said air-check.

17. In a type-writing machine, the combination of a carriage, an escapement-rack, a key-controlled rocker, a yielding dog carried by said rocker and normally disengaged from the rack, a catch upon said rocker for preventing the dog from yielding under the pressure of the rack, an air-check for releasing said catch, and an adjustable vent for said air-check.

702,749. CAMERA-STAND. JAMES E. SMITH, Chicago, Ill. Filed Feb. 24, 1902. Serial No. 93,149. (No model.)

Claim.—1. The combination with the stationary frame of a camera-stand, of vertically-movable guide-frames at front and rear, a supporting camera-bed hinged to the upper ends respectively of said supporting guide-frames, vertical supporting-rods rigidly attached to said guide-frames, automatic friction-clamps attached to said stationary frame for normally clamping said rods against downward movement, transverse levers pivotally attached to the bottom of the frame and projecting outwardly therefrom, and means for connecting said foot-levers with said friction-clamps.

2. The combination with the stationary frame of a camera-stand, of vertically-movable guide-frames at front and rear, a supporting camera-bed hinged to the upper ends respectively of said supporting guide-frames, vertical supporting-rods rigidly attached to said guide-frames, automatic friction-clamps attached to said stationary frame for normally clamping said rods against downward movement, transverse levers pivotally attached to the lower portion of the frame, foot-levers f in operative connection with said transverse levers, and rods p for connecting said transverse levers with said friction-clamps.

702,750. COOLING ATTACHMENT FOR INTERNAL-COMBUSTION MOTORS. FREDERICK THORNTON, New York, N. Y., assignor of one-half to William Kammerer, Jersey City, N. J. Filed Jan. 23, 1902. Serial No. 91,777. (No model.)

Claim.—1. A cooling attachment for internal-explosion motors, consisting of a hollow body having an enlarged upper end formed with a laterally-extending portion, the under side of said laterally-extending portion being provided with a screened opening, and a connecting-tube provided at the lower end of said hollow body, substantially as set forth.

2. A cooling attachment for internal-explosion motors, consisting of a hollow body having an enlarged upper end formed with a laterally-extending portion, said laterally-extending portion having a screened opening in the under side thereof, a connecting-tube projecting from the lower end of said body, and a baffle-plate arranged in said body at the lower end thereof, opposite said connecting-tube, substantially as set forth.

3. The combination, with the casing of an internal-explosion motor provided with a suitable discharge-opening, of a cooling attachment consisting of a hollow body having an enlarged upper end and provided with a screened opening, a connecting-tube at the lower end of said body, and an internal baffle-plate arranged opposite the inner end of said connecting-tube, substantially as set forth.

702,751. TRANSMITTER. ANTHONY VAN WAGEN, Sioux City, Iowa. Filed Mar. 27, 1901. Serial No. 93,098. (No model.)

Claim.—1. In a transmitter, the combination, with circuit-varying

mechanism having an operating member movable in a prescribed path, and an indicator adapted to arrest the movement of such operating member at different stages of its movement, according to the position of the indicator, of a releasing device adapted to release such operating member when so held, and means operated independently of the operation of the indicator for driving such operating member.

2. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member, and an indicator adapted to arrest such operating member at different stages of its movement, according to the position of the indicator, of a releasing device adapted to release such operating member when so held, and means operated independently of the operation of the indicator for driving such operating member.

3. In a transmitter, the combination, with circuit-varying mechanism having an operating member movable in a prescribed path, an indicator, and means operated thereby, adapted to arrest such operating member at different stages of its movement, according to the position of the indicator, of a releasing device adapted to release such operating member when so held, and means operated independently of the operation of the indicator for driving such operating member.

4. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member, an indicator, and means operated thereby adapted to arrest such operating member at different stages of its movement, according to the position of the indicator, of a releasing device adapted to release such operating member when so held, and means operated independently of the operation of the indicator for driving such operating member.

5. In a transmitter, the combination, with circuit-varying mechanism, having an operating member movable in a prescribed path, hand-operated power-storing mechanism for driving said operating member, an indicator movable independently of said power-storing mechanism provided with means whereby it may be held in different positions, and means operated by the indicator for arresting said operating member at different stages of its movement according to the position of the indicator, of a locking device for holding the indicator in predetermined positions in which it may be placed, means operated by said power-storing mechanism when power has been stored therein to the full extent, for causing said locking device to lock the indicator and for releasing the said operating member, and a releasing device adapted to release the indicator, when so locked, thereby permitting the operating member and indicator to return to their initial positions.

6. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member, hand-operated power-storing mechanism for driving said operating member, an indicator movable independently of said power-storing mechanism provided with means whereby it may be held in different positions, and means operated by the indicator for arresting said operating member at different stages of its movement, according to the position of the indicator, of a locking device for holding the indicator in predetermined positions in which it may be placed, means operated by said power-storing mechanism when power has been stored therein to the full extent, for causing said locking device to lock

the indicator and for releasing the said operating member, and a releasing device adapted to release the indicator, when so locked, thereby permitting the indicator and operating member to return to their initial positions.

7. In a transmitter, the combination, with circuit-varying mechanism, having a revoluble operating member, a stationary dial, an indicator, a dial-wheel beneath the dial, but connected with the indicator, provided with means whereby it may be held in different positions, corresponding to the divisions of the dial, and having also means for arresting the operating member of such circuit-varying mechanism at different stages of its movement according to the position of the indicator, of locking means for holding said operating member in an initial position normally and for holding the dial-wheel in positions corresponding to the dial-divisions, means for releasing the operating member from such initial position, and a releasing device adapted to release the dial-wheel when so held and permit the same and the operating member to return to their initial positions.

8. In a transmitter, the combination, with a toothed contact-wheel, a stationary brush therefor, and means for driving said wheel, whereby, when the wheel rotates, a circuit is alternately made and broken, of a dial-wheel correspondingly toothed, a stationary dial, a pointer connected to the dial-wheel, a locking device adapted to hold the contact-wheel normally in an initial position, and to release the same and hold the dial-wheel when the pointer has been set, said dial-wheel and contact-wheel having corresponding and engaging projections whereby the contact-wheel, when released, is arrested in a position corresponding to that to which the pointer has been set, and a releasing device adapted, when operated, to release the dial-wheel and contact-wheel and permit them to return to their initial positions.

9. In a transmitter, the combination, with circuit-varying mechanism having an operating member movable continuously forward in a prescribed path, and having no backward movement, means for driving such operating member, an indicator, and means operated thereby adapted to arrest the movement of the operating member at different stages of the operation of the circuit-varying mechanism according to the position of the indicator, of a releasing device, adapted to support a telephone instrument, and operated to release said operating member by the replacing of such instrument.

10. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member movable continuously forward and having no backward movement, means for driving such operating member, an indicator, and means operated thereby adapted to arrest the movement of the operating member at different stages of the operation of the circuit-varying mechanism according to the position of the indicator, of a releasing device, adapted to support a telephone instrument, and operated to release said operating member by the replacing of such instrument.

11. In a transmitter, the combination, with circuit-varying mechanism, having an operating member movable in a prescribed path, hand-operated power-storing mechanism for driving said operating member, an indicator provided with means whereby it may be held in different positions, and means operated by the indicator for arresting said operating member at different stages of its movement according to the position of the indicator, of a locking device for holding the indicator in predetermined positions in which it may be placed, means operated by said power-storing mechanism when power has been stored therein to the full extent, for causing said locking device to lock the indicator and for releasing the said operating member, and a releasing device adapted to support a telephone instrument, and to release the indicator if so locked, when such telephone instrument is placed upon it, thereby permitting the operating member and the indicator to return to their initial positions.

12. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member, hand-operated power-storing mechanism for driving said operating member, an indicator provided with means whereby it may be held in different positions, and means operated by the indicator for arresting said operating member at different stages of its movement according to the position of the indicator, of a locking device for holding the indicator in predetermined positions in which it may be placed, means operated by said power-storing mechanism when power has been stored therein to the full extent, for causing said locking device to lock the indicator and for releasing the said operating device, and a releasing device adapted to support a telephone instrument, and to release the indicator if so locked, when such telephone instrument is placed upon it, thereby permitting the operating member and the indicator to return to their initial positions.

13. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member, means for driving said member, and a dial-wheel, engaging and adapted to arrest, or to be driven by, said operating member, but independently movable, of an escapement member adapted, when the parts are in normal position, to hold said operating member stationary, and when in the opposite position to release

the operating member and hold the dial-wheel stationary, means for moving said escapement member, and a releasing device, adapted to support a telephone instrument, and to operate said escapement member, and arranged when such telephone instrument is placed upon it, to operate the escapement member and release the dial-wheel.

14. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member, power-storing means for driving said member, and a dial-wheel, engaging and adapted to arrest, or to be driven by, said operating member, but independently movable, of an escapement-lever adapted, when the parts are in normal position, to hold said operating member stationary, and when in the opposite position to release the operating member and hold the dial-wheel stationary; said power-storing mechanism being arranged to operate said escapement-lever and release said operating member when power has been stored in such mechanism to the full extent, and a releasing device, adapted to support a telephone instrument, and to operate said escapement-lever, and arranged to operate the escapement-lever and release the dial-wheel when said telephone instrument is placed upon it.

15. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member, a spring for driving said member, a hand-operated member for winding up said spring, and a dial-wheel, engaging and adapted to arrest, or to be driven by, said operating member, but independently movable, of an escapement-lever adapted, when the parts are in normal position, to hold said operating member stationary, and when in the opposite position to release the operating member and hold the dial-wheel stationary, said spring-winding member being arranged to operate said escapement-lever and release the operating member, when the spring has acquired full tension, and a releasing device, adapted to support a telephone instrument, and to operate said escapement-lever, and arranged to operate the escapement-lever and release the dial-wheel when said telephone instrument is placed upon it.

16. In a transmitter, the combination, with circuit-varying mechanism having a rotary contact-wheel, a brush adapted to contact therewith, and a spring for rotating said wheel, a dial-wheel mounted concentrically with respect to said contact-wheel, engaging the same, and adapted to arrest, or to be driven by, said contact-wheel, and means for winding up said spring, of an escapement member adapted, when the parts are in normal position, to hold said contact-wheel stationary, and when in the opposite position to release said contact-wheel and hold the dial-wheel stationary, means for so operating said escapement-lever, and a receiver-support, movably mounted and spring-supported, and adapted to operate the escapement-lever and release the dial-wheel when the receiver is placed upon it.

17. In a transmitter, the combination, with circuit-varying mechanism having a revoluble operating member, a spring for driving said member, a hand-operated member for winding up said spring, and a dial-wheel, engaging and adapted to arrest, or to be driven by, said operating member, but independently movable, of an escapement member which, when the parts are in normal position, holds said operating member stationary, and which when in its opposite position releases the operating member and holds the dial-wheel stationary, means tending to move the escapement member to such opposite position, a releasing-lever, a spring tripping-piece carried thereby and adapted to engage a locked portion of the escapement member, said tripping-piece being bent when the parts are in normal position, but being adapted, upon the movement of the releasing-lever, when the dial-wheel is locked, to engage said escapement member and move the same into position to release the dial-wheel and engage and arrest the operating member of the circuit-varying mechanism upon the return of the latter to its initial position; and the spring-winding member being adapted, when operated with the parts in normal position, to engage the escapement member and operate the same to release said spring tripping-piece from engagement with the escapement member and so to permit said tripping-piece to spring outward, thereby permitting the escapement member to release the operating member of the circuit-varying mechanism and to engage the dial-wheel.

18. In a transmitter, the combination, with signal-transmitting mechanism, and a detent device adapted to hold such mechanism from returning to normal condition after the transmission of a signal, of a releasing device, and a tripping-piece interposed between said detent and releasing device, carried by one of said devices, and adapted to engage the other, said tripping-piece being under stress tending to move it out of such engagement when so in engagement and when the signal-transmitting mechanism and the detent and releasing device are in normal positions, and being adapted to operate the detent device and release the signal-transmitting mechanism upon the operation of the releasing device after the transmission of a signal.

19. In a transmitter, the combination, with signal-transmitting mechanism comprising circuit-varying mechanism, an indicator and means operated thereby adapted to arrest the operation of the circuit-varying mechanism at intermediate stages of its operation, according to the position of said indicator, power-storing mechanism for operating said signal-transmitting mechanism, and a detent device normally holding the signal-transmitting mechanism against operation and adapted to hold such mechanism from returning to normal condition after the transmission of a signal, of a receiver-support, a tripping-piece interposed between said detent and receiver-support, carried by one of said devices and adapted to engage the other, said tripping-piece being under stress tending to move it out of such engagement when so in engagement and when the signal-transmitting mechanism and the detent and receiver-support are in normal positions, and being adapted, when the parts are in such positions, to prevent release of the signal-transmitting mechanism; and means for releasing such tripping device and causing the detent to release the signal-transmitting mechanism when full power has been stored in said power-storing mechanism; said tripping-piece being arranged to operate the detent upon depression of the receiver-support after transmission of a signal, and thereby to release the signal-transmitting mechanism and to permit the same to return to normal condition.

20. In a transmitter, the combination, with signal-transmitting mechanism, and a detent device normally holding the signal-transmitting mechanism against operation and adapted to hold such mechanism from returning to normal condition after the transmission of a signal, of a releasing device, a tripping-piece interposed between said detent and releasing device, and adapted, upon operation of the releasing device, after the transmission of a signal, to operate the detent device and thereby to release the signal-transmitting mechanism and permit the same to return to normal condition, and means for operating the detent and causing the same to release the signal-transmitting mechanism when the power-storing mechanism has stored full power.

21. In a transmitter, the combination, with signal-transmitting mechanism, and a detent device adapted to hold such mechanism from returning to normal condition after the transmission of a signal, of a receiver-support, movably mounted and provided with means for elevating it upon the removal of a receiver therefrom, a tripping-piece interposed between said detent and receiver-support, carried by one of said devices and adapted to engage the other, said tripping-piece being under stress tending to move it out of such engagement when so in engagement and when the signal-transmitting mechanism and the detent and receiver-support are in normal positions, and being adapted to operate the detent device and release the signal-transmitting mechanism upon the depression of the receiver-support after the transmission of a signal.

22. In a transmitter, the combination, with signal-transmitting mechanism comprising circuit-varying mechanism, an indicator and means operated thereby adapted to arrest the operation of the circuit-varying mechanism at intermediate stages of its operation, according to the position of said indicator, power-storing mechanism for operating said signal-transmitting mechanism, and a detent device normally holding the signal-transmitting mechanism against operation, and adapted to hold such mechanism from returning to normal condition after the transmission of a signal, of a receiver-support, a tripping-piece interposed between said detent and said receiver-support, and adapted, upon depression of the receiver-support, after the transmission of a signal, to operate the detent and thereby to release the signal-transmitting mechanism and to permit the same to return to normal condition, and means for operating the detent and causing the same to release the signal-transmitting mechanism when the power-storing mechanism has stored full power.

23. In a transmitter, the combination, with signal-transmitting mechanism comprising circuit-varying mechanism, an indicator and means operated thereby adapted to arrest the operation of the circuit-varying mechanism at intermediate stages of its operation, according to the position of said indicator, power-storing mechanism for operating said signal-transmitting mechanism, and a detent device normally holding the signal-transmitting mechanism against operation and provided with means tending to cause it to release said mechanism, said detent device being adapted likewise to hold such signal-transmitting mechanism against return to normal condition after transmission of a signal, of a receiver-support, movably mounted and provided with means for elevating it upon the removal of the receiver therefrom, a tripping-piece interposed between the receiver-support and detent, and normally preventing release of the signal-transmitting mechanism by the detent, and means for operating the detent and releasing the signal-transmitting mechanism when full power has been stored in said power-storing mechanism; said tripping-piece being adapted, upon depression of the receiver-support after the transmission of a signal to operate the detent and permit such signal-transmitting mechanism to return to normal condition.

24. In a transmitter, the combination, with signal-transmitting mechanism, power-storing mechanism for operating the same, and a detent device normally holding the signal-transmitting mechanism against operation and provided with means tending to cause it to release said mechanism, said detent device being likewise adapted to hold such signal-transmitting mechanism against return to normal condition after transmission of a signal, of a receiver-support, movably mounted and provided with means for elevating it upon removal of a receiver therefrom, a tripping-piece interposed between said receiver-support and said detent, operatively connected to one of said devices and adapted to engage the other, said tripping-piece being under stress tending to move it out of such engagement when so in engagement and when the signal-transmitting mechanism and the detent and receiver-support are in normal positions, and being adapted, when the parts are in such positions, to prevent release of the signal-transmitting mechanism; and means for releasing such tripping device and causing the detent to release the signal-transmitting mechanism when full power has been stored in said power-storing mechanism; said tripping-piece being arranged to operate the detent upon depression of the receiver-support after transmission of a signal, and thereby to release the signal-transmitting mechanism and to permit the same to return to normal condition.

25. In a transmitter, the combination, with circuit-varying mechanism adapted to transmit a plurality of signals, an adjustable arresting device, adapted to arrest the operation of the circuit-varying mechanism in

accordance with the signals to be sent, and a detent device adapted in normal position to hold the circuit-varying mechanism in normal position, or to arrest such circuit-varying mechanism upon its return to normal position, said detent device being likewise adapted when in opposite position to release the circuit-varying mechanism and to hold the arresting device against further adjustment, of a releasing device, a tripping-piece interposed between said releasing device and said detent device, secured to one of said devices, and adapted to engage the other, and which is under stress tending to cause it to move out of such engagement when in such engagement and when the releasing and detent devices are in normal position, and means for operating the detent device to permit the transmission of a signal; said tripping-piece being adapted, upon operation of the releasing device after transmission of a signal, to operate the detent and release the circuit-varying mechanism.

25. In a transmitter, the combination, with circuit-varying mechanism adapted to transmit a plurality of signals, power-storing mechanism for operating the same, an adjustable arresting device, adapted to arrest the operation of the circuit-varying mechanism in accordance with the signals to be sent, and a detent device adapted in normal position to hold the circuit-varying mechanism in normal position, or to arrest such circuit-varying mechanism upon its return to normal position, said detent device being likewise adapted when in the opposite position to release the circuit-varying mechanism and to hold the arresting device against further adjustment, of a releasing device, a tripping-piece interposed between said releasing device and said tripping device, secured to one of said devices, and adapted to engage the other, and which is under stress tending to cause it to move out of such engagement when in such engagement and when the releasing and detent devices are in normal position, and means for operating the detent device and causing it to release the circuit-varying mechanism and lock the arresting device, when the power-storing mechanism has stored full power; said tripping-piece being adapted, upon operation of the releasing device after the transmission of a signal, to operate the detent and release the circuit-varying mechanism.

702,753. ELECTROURGICAL INSTRUMENT. RICHARD E. WATKINS, New York, N. Y. Filed June 10, 1901. Serial No. 65,542. (No model.)

Claim.—1. In an electrourgical instrument and in combination, two concentrically-placed inner and outer tubes connected at their contacting surfaces, means for closing the space between the tubes at their respective ends, an insulated conductor longitudinally of the tubes in the space between the same, and means for sealing the tubes at the respective ends of the electrical conductor, substantially as specified.

2. In an electrourgical instrument and in combination, two concentrically-placed inner and outer tubes connected at their contacting surfaces, means for closing the space between the same at their respective ends,

an insulated conductor longitudinally of the tubes in the space between the same, and means for connecting to one end of said tubes an electric lamp and means connected to the other end of said tubes for attachment thereto of electric terminals, substantially as set forth.

3. In an electrourgical instrument and in combination, two concentrically-placed inner and outer tubes connected at their contacting surfaces so that the inner tube is open-ended, means for closing the space between the same at their respective ends, an insulated conductor longitudinally of the tubes in the space between the same, and means for sealing the tubes at the respective ends of the electrical conductor and providing for contact therewith of electrical devices, a device adapted to be inserted through the open-ended inner tube for complementing the functions of the instrument, substantially as set forth.

4. In an electrourgical instrument, and in combination, two tubes placed the one within the other and connected together, means for closing the space between the same at their respective ends, an insulated conductor longitudinally of the tubes in the space between the same and means for sealing the tubes at the respective ends of the electrical conductor and providing for contact therewith of electrical devices, substantially as specified.

5. In an electrourgical instrument, the combination with two concentrically-placed tubes secured together at their contacting surfaces and having the open space between the same at the ends thereof sealed, of an electric lamp secured in an offset position at one end of said tubes, terminals secured to the other end of said tubes, electrical connections between one of said terminals and one of the lamp-terminals, and means connecting with the said terminals for opening and closing the circuit through the lamp, substantially as set forth.

6. In an electrourgical instrument and in combination, two tubes placed the one within the other and connected together, means for closing the space between the same at their respective ends, an insulated conductor longitudinally of the tubes in the space between the same and means for connecting to one end of said tubes an electric lamp, and means connected to the other end of said tubes for attachment thereto of electric terminals, substantially as specified.

7. In an electrourgical instrument the combination with two concentric tubes secured together, having one end cut at an angle and the open space between the tubes at both ends sealed, of an electric lamp in an offset position secured to the tubes at the end thereof cut at an angle, electrical terminals at the other end of the said tubes, a switch having spring-contacts adapted to bear upon said terminals, electrical connections between the said tubes from the said terminals to the said lamp, and a device adapted to be inserted through the open-ended inner tube for complementing the functions of the instrument, substantially as specified.

8. In an electrourgical instrument, the combination with two concentric tubes secured together having one end cut at an angle and the open space between the tubes at both ends sealed, of an electric lamp in an offset position secured to the tubes at the end thereof cut at an angle, electrical terminals at the other end of the said tubes, a switch having spring-contacts adapted to bear upon said terminals, and electrical connections between the said tubes from the said terminals to the said lamp, substantially as specified.

9. In an electrourgical instrument, the combination with two concentric tubes secured together, having one end cut at an angle and the open space between the tubes at both ends sealed, of an electric lamp in an offset position secured to the tubes at the end thereof cut at an angle, electrical terminals at the other end of the said tubes, a switch having spring-contacts adapted to bear upon said terminals, electrical connections between the said tubes from the said terminals to the said lamp, and a tube fitting the inner of the said tubes and carrying each position during the insertion of the instrument and having one end made to conform to the concentric tubes which are cut at an angle, the said tube being provided with independent ducts which are employed as a supply and return for the fluid used for cleaning purposes, substantially as specified.

10. In an electrourgical instrument, the combination with a pair of tubes one within the other, an insulated conductor longitudinally of the tubes in the space between the same, means for closing the space between the tubes at their respective ends, a sleeve of greater diameter than the outer tube surrounding the same at one end and connecting with the closing device at the said end, and exteriorly threaded, and devices surrounding the said sleeve and in part insulated therefrom and which devices form electrical contacts with the outer tubes and with the inner insulated conductor respectively and are adapted for connection with external electric conductors, substantially as set forth.

11. In an electrourgical instrument, the combination with two concentrically-placed inner and outer tubes connected at their contacting surfaces with the inner tube at one end longer than the outer tube, of means for closing the space between the tubes at one end, a sleeve surrounding the outer tube at its end and of greater diameter exteriorly threaded and extending to the end of the inner tube, an annulus between the sleeve

and the inner tube secured thereto for closing this end of the concentrically-placed tubes, an insulated conductor longitudinally of the tubes in the space between the same and having a terminal within the sleeve, devices surrounding the said sleeve and insulated from one another and through which metallic contacts are formed with the sleeve and with the end of the insulated conductor within the sleeve and which devices are adapted for contact with external electrical devices, substantially as set forth.

12. In an electrourgical instrument, the combination with two concentrically-placed inner and outer tubes connected at their contacting surfaces with the inner tube at one end longer than the outer tube, of means for closing the space between the tubes at one end, a sleeve surrounding the outer tube at its end and of greater diameter exteriorly threaded and extending to the end of the inner tube, an annulus between the sleeve and the inner tube secured thereto for closing this end of the concentrically-placed tubes, an insulated conductor longitudinally of the tubes in the space between the same, an insulating-ring and an outer metal ring surrounding the inner tube with one end of the said conductor connected to said metal ring, a series of rings insulated from one another and surrounding the said sleeve, one of said rings being in metallic contact with the sleeve and another of said rings in metallic contact with the end of the insulated conductor within the sleeve and said rings adapted for connection with outside electrical devices, substantially as set forth.

13. In an electrourgical instrument, the combination with two concentrically-placed inner and outer tubes connected at their contacting surfaces with the inner tube at one end longer than the outer tube, of means for closing the space between the tubes at one end, a sleeve surrounding the outer tube at its end and of greater diameter exteriorly threaded and extending to the end of the inner tube, an annulus between the sleeve and the inner tube secured thereto for closing this end of the concentrically-placed tubes, an insulated conductor longitudinally of the tubes in the space between the same, an insulating-ring and an outer metal ring surrounding the inner tube with one end of the said conductor connected to said metal ring, a ring *g* surrounding and covering upon the sleeve *f*, a ring *h* larger than the sleeve surrounding the same and a lock-out *i* also covering upon the sleeve with the ring *h* between and insulated from the lock-out and the ring *g*, a pin passing through the ring *h* and freely through a hole in the sleeve and contacting therewith with the ring to which the insulated conductor is connected, substantially as set forth.

14. In an electrourgical instrument, the combination with two concentrically-placed inner and outer tubes connected at their contacting surfaces with the inner tube at one end longer than the outer tube, of means for closing the space between the tubes at one end, a sleeve surrounding the outer tube at its end, of greater diameter, exteriorly threaded and extending to the end of the inner tube, an annulus between the sleeve and the inner tube secured thereto for closing this end of the concentrically-placed tubes, an insulated conductor longitudinally of the tubes in the space between the same, an insulating-ring and an outer metal ring surrounding the inner tube with one end of the said conductor connected to said metal ring, a ring *g* surrounding and covering upon the sleeve *f*, a ring *h* larger than the sleeve surrounding the same, and a lock-out *i* also covering upon the sleeve with the ring *h* between and insulated from the lock-out and the ring *g*, a pin passing through the ring *h* and freely through a hole in the sleeve and contacting therewith with the ring to which the insulated conductor is connected, the ring *h* being flared in cross-section and the opposing edges of the ring *g* and the lock-out *i* being undercut, so that the insulating-washers are at an inclination, the said parts exerting a wedge-like action to hold the ring *h* in position, the rings *h* and *g* having annular semi-circular grooves adapted for connection with external electrical devices, substantially as set forth.

15. In an electrourgical instrument and in combination, a pair of tubes one within the other, an insulated conductor longitudinally of the tubes in the space between the same, means for closing the space between the tubes at their respective ends, means for sealing the tubes at the respective ends of the insulated electrical conductor, means for connecting to one end of said tubes an electric lamp in an offset position, and electric connections therefrom to one end of the insulated conductor, lead-wires and terminals from a source of electric energy, an insulated terminal connected to the other end of the insulated conductor, means for covering the latter insulated terminal and to which means one lead-wire is electrically connected and insulated devices electrically connecting the other lead-wire with the insulated terminal, substantially as set forth.

702,758. STAMPING-MACHINE. HENRY WATKINS, Utica, N. Y., assignor to Robert H. Antisell, Utica, N. Y. Filed May 31, 1901. Serial No. 65,622. (No model.)

Claim.—1. A garment-stamping machine comprising a bed-plate, an invertible die and an ink-pad both movable toward and away from the bed-plate and each forming a stop for the other and means for actuating the die and ink-pad.

2. In a garment-stamping machine, the combination with a bed-plate, a die movable toward and away from the bed-plate, inking means movable into contact with the stamping-face of the die and means to simultaneously actuate the die and inking means said die and inking means forming stops for each other.

3. A garment-stamping machine comprising a bed-plate for supporting the articles to be stamped, a die and inking-pad movable toward and away from each other means for inverting the die as it is moved toward and from the pad, the die being movable into engagement with the article to be stamped and means for simultaneously actuating the die and inking-pad in opposite directions.

4. In a machine for stamping garments, the combination with a bed-plate, a lever having a rock-shaft and a die secured to the rock-shaft and rock-shaft and its die being movable toward and away from the bed-plate, a graduated scale on the bed-plate extending in either direction from the printing position of the die, index-fingers movable along said graduations means for operating the lever, and additional means for rocking the shaft and its die as the lever is rocked.

702,754. WINDOW. WILLIAM D. WARREN, Chicago, Ill. Filed Oct. 4, 1901. Serial No. 77,576. (No model.)

Claim.—1. In a window, the combination with a plurality of panes of glass, of a cash grooved to inclose said panes of glass, a bar fixed to and extending across the cash in front of the plane of the groove and past which the panes may be slid laterally to introduce them to and withdraw them from the lateral portions of the groove, a clamping-bar interposed between the panes when slid into the side grooves and bearing against their adjacent edges opposite to the fixed bar, and means for detachably securing the clamping-bar in place, substantially as described.

2. In a window, the combination with a plurality of panes of glass, of a cash grooved to inclose said panes of glass, a bar fixed to and extending across the cash in front of the plane of the groove and past which the panes may be slid laterally to introduce them to and withdraw them from the lateral portions of the groove, a clamping-bar interposed between the panes when slid into the side grooves and bearing against their adjacent edges opposite to the fixed bar, and clamping-screws detachably securing the clamping-bar to the fixed bar, substantially as described.

3. In a window, the combination with a plurality of panes of glass, of a metal cash grooved to receive said glass, the upper portion of said groove being an open slot through which the glass may be abnormally projected, a bar extending across the cash in front of the groove and against which the adjacent edges of the panes bear on their front sides, a clamping-bar interposed between the panes and bearing against their adjacent edges on their rear sides, and means for detachably securing the clamping-bar in place, substantially as described.

4. In a window, the combination with a plurality of panes of glass, of a metal cash grooved to receive said glass, a bar extending across the cash in front of the groove and against which the adjacent edges of the panes bear on their front sides, a clamping-bar interposed between the panes and bearing against their adjacent edges on their rear sides, screw-plates secured in the cross-bar, and screws passing into the screw-plates to secure the clamping-bar detachably in place, substantially as described.

702,755. FURNACE. WILLIAM F. WILSON, New York, N. Y., assignor to American Furnace Company, New York, N. Y., a Corporation of New York. Filed Oct. 12, 1901. Serial No. 78,178. (No model.)

Claim.—1. In a furnace, the combination, with furnace-walls, of an arch over the combustion-chamber composed of separable cast-iron-sections extending from the side walls to the center, supported from the side walls tapering therefrom toward the center, and joined at the center.

2. In a furnace, the combination with furnace-walls, of an arch over the combustion-chamber having a substantially flat top, and composed of separable cast-iron-sections set into the side walls, and extending therefrom to the center, supported from the side walls, tapering from said side walls toward the center, and joined at the center.

3. In a furnace, the combination, with furnace-walls, of a substantially horizontal arch covering the greater portion of the combustion-chamber composed of cast-iron-sections supported from the side walls and joined at the center, an opening being provided, at the front of the furnace, for the escape of a portion of the furnace-gases, and another opening at the rear for the escape of the remainder of the furnace-gases, and an air-flue at the front of the furnace which directs entering air along the surface of said arch.

4. In a furnace, the combination, with furnace-walls, of an arch covering the greater portion of the combustion-chamber, an opening being provided at the front of the furnace, for the escape of a portion of the furnace-gases and another larger opening being provided at the rear for the escape of the remainder of the furnace-gases, and an air-flue for admitting air to the furnace in the immediate vicinity of said arch, arranged to direct such air along the upper surface of said arch, whereby the air becomes highly heated before encountering the furnace-gases issuing through such larger opening.

5. In a furnace, the combination with furnace-walls, and a central support for an arch over the combustion-chamber of said furnace, formed of refractory material, and supported at one end only, of an arch over the combustion-chamber composed of cast-iron-sections supported from the side walls and provided with means for transferring weight from one to the other and finally to said support, by which support a portion only of the arch is directly supported.

6. In a furnace, the combination with furnace-walls, a bridge-wall, and a central support for an arch over the combustion-chamber of said furnace, formed of refractory material, projecting from the bridge-wall, and supported at one end only, of an arch over the combustion-chamber composed of cast-iron-sections supported from the side walls and provided with means for transferring weight from one to the other and finally to said support, by which support a portion only of the arch is directly supported.

7. In a furnace, the combination with furnace-walls, and a central support for an arch over the combustion-chamber of said furnace, formed of refractory material, projecting from the front wall, and supported at one end only, of an arch over the combustion-chamber composed of cast-iron-sections supported from the side walls and provided with means for transferring weight from one to the other and finally to the said support, by which support only a portion of the arch is directly supported.

8. In a furnace, the combination with furnace-walls, a bridge-wall, and independent central supports for an arch over the combustion-chamber, projecting from the front and from the bridge walls, respectively, and formed of refractory material, of an arch over the combustion-chamber composed of cast-iron-sections supported from the side walls, and provided with means for transferring weight from one to the other and finally to the said supports, by which supports portions only of the arch are directly supported.

702,756. STEAM-BOILER OR OTHER FURNACE. WILLIAM F. WILSON, New York, N. Y., assignor to American Furnace Company, New York, N. Y., a Corporation of New York. Original application filed Oct. 12, 1901, Serial No. 79,178. Divided and this application filed Mar. 8, 1903. Serial No. 94,951. (No model.)

Claim.—1. In a furnace, the combination with furnace-walls, an arch over the combustion-chamber, openings being provided at the front and rear of the arch for the escape of furnace-gases, and a 'baffle-plate' which directs forward and over the arch the furnace-gases escaping through

the said rear opening, of an air-flue which admits air beneath the arch and directs it along the lower surface thereof.

2. In a furnace, the combination with furnace-walls, of an arch over the combustion-chamber, an opening being provided at the front of the arch for the escape of a portion of the furnace-gases, and another opening being provided at the rear for the escape of the remainder of the furnace-gases, an air-flue at one end of the combustion-chamber for admitting air to the furnace, and means opening up of said openings and containing a flue forming a continuation of such air-flue, for delivering air in the immediate vicinity of said arch.

3. In a furnace, the combination with furnace-walls, of an arch over the combustion-chamber, an opening being provided at the front of the arch for the escape of a portion of the furnace-gases, and another opening provided at the rear for the escape of the remainder of the furnace-gases, and a support for the arch, opening one of said openings, and containing an air-flue which admits air beneath the arch and directs it along the lower surface thereof.

4. In a furnace, the combination with furnace-walls, of an arch over the combustion-chamber comprising showback supports supported and projecting from the furnace-walls and forming part of the span of the arch, and main cast-iron-sections extending from the center to the ends of the arch, supported by said showbacks but not to said side walls, supported by said showbacks and joined at the center.

702,757. BALL GRINDING-MILL. MAX F. ANGE, New York, N. Y. Filed Sept. 22, 1902. Serial No. 30,555. (No model.)

Claim.—1. In a ball grinding-mill, the combination of a cylindrical drum, a head at the ingoing end of the drum, a perforated head at the outgoing end of the drum, a smaller extension, one at each end of the drum extending beyond the heads of the drum, a flange applied one to each of said extensions, a screw conveyor passing through the ingoing head,

a closing-plate closing the extension of the outgoing end of the drum, a screw conveyor passing through said closing-plate, a plurality of cushioning-blocks in step arrangement longitudinally at the interior circumference of the drum, reversible flange-plates secured in said cushioning-blocks, and angular flanges secured, one to the projecting edge of each of said cushioning-blocks, each flange extending upon its block beneath the flange-plate and downwardly over the exposed front of the block, and being attached at its front portion thereto, substantially as set forth.

2. In a ball grinding-mill, the combination, with a rotary drum and grinding-balls within the same, of a gear-ring applied to said drum, and a cushioning-ring interposed between the gear-ring and drum for taking up the oscillations within the latter, substantially as set forth.

702,758. METHOD OF GRAPHITIZING ELECTRODES. EDWARD G. JOHNSON, Buffalo, N. Y., assignor to the International Acme Graphite Company, Niagara Falls, N. Y., a Corporation of New Jersey. Filed Dec. 18, 1902. Serial No. 24,748. (No specimens.)

Claim.—1. The herein-described method of subjecting electrodes and other articles, composed of carbon and impurities capable of determining the conversion of the carbon into graphite, to a high temperature through the agency of electricity, which consists in arranging said electrodes or other articles with their longest dimensions in the same general direction, and then passing a current of electricity through the same in a direction approximately transverse to the direction of their longest dimensions.

2. The herein-described method of graphitizing electrodes and other articles, composed of carbon and impurities capable of determining the conversion of the carbon into graphite when subjected to a high temperature through the agency of electricity, which consists in embedding said electrodes or other articles, with their longest dimensions in the same general direction, in a mass of material having a lower coefficient of electrical conductivity than said articles, and then passing an electric current through the electrodes or other articles in a direction approximately transverse to the direction of their longest dimensions.

3. The herein-described method of graphitizing electrodes and other articles, composed of carbon and impurities capable of determining the conversion of the carbon into graphite when subjected to a high temperature through the agency of electricity, which consists in arranging the electrodes and other articles in separate piles with the longest dimensions of said electrodes or other articles in each pile in the same general direction, surrounding the piles with a mass of material having a lower coefficient of electrical conductivity than the articles themselves, and then passing an electric current through said electrodes or other articles in a direction approximately transverse to the direction of their longest dimensions.

4. The herein-described method of graphitizing electrodes and other articles composed of carbon and impurities capable of determining the conversion of carbon into graphite when subjected to a high temperature which consists in arranging said electrodes or other articles in piles separated by a mass of material having a lower coefficient of electrical conductivity than said articles, and then subjecting the electrodes or other articles to a temperature sufficiently high and for a sufficient length of time to convert a greater or less proportion of the amorphous carbon into graphite.

702,759. WATER-BAG. THOMAS L. ALLENBURY, Chicago, Ill. Filed Oct. 14, 1901. Serial No. 78,888. (No model.)

Claim.—1. A water-bag adapted to be applied to the upper portion of the foot, which comprises a water-tight oblong receptacle a portion of which is adapted to cover the forefoot and has one of the upper corners extended with a flange-aperture therein, and a plug for closing said aperture, depending lobes made integral with the lower edge of the receptacle having a curved portion therebetween for the reception of the toes, one made integral with the ends of the oblong receptacle about midway of its width, and strings attached to said ends for binding the receptacle to the foot, substantially as described.

2. A water-bag adapted to be applied to the foot, which comprises a water-tight flexible receptacle having an aperture for filling the same and a plug for closing the aperture, a covering of thick non-conducting material secured to the outer line of said receptacle for retaining the heat within the bag, a thin covering of conducting material on the opposite side

of the bag for contact with the foot, and strings carried by the receptacle for securing the same to the wearer's foot, substantially as described.

702,760. ELECTROCHEMICAL GENERATOR. HARRY S. AWAKE, Camden, N. J., assignor to Charles H. Graham and George D. Burton, Philadelphia, Pa. Filed Mar. 12, 1902. Serial No. 94,978. (No model.)

Claim.—1. An electrochemical generator consisting of a single fluid-cell, provided with a positive electrode and a negative fixed electrode, an electrolyte, and a current-conducting baffle-partition in said electrolyte, between said electrodes and normally insulated therefrom.

2. An electrochemical generator, consisting of a positive electrode, a negative fixed electrode, an electrolyte, an electric-current-conducting baffle-partition normally insulated from said electrodes and means for making said baffle-partition part of either of said electrodes to act there-with.

3. An electrochemical generator consisting of a single fluid-cell having positive and negative electrodes and a current-conveyor of high conducting or current-carrying capacity interposed as a modifier, screen or baffle between the positive and negative electrodes and adapted to control the rate of change of position of the electrolyte attacking the electrodes must be acted upon without interfering with the current-flow between the electrodes in the case.

4. An electrochemical generator consisting of a single fluid-cell provided with a positive electrode and a negative fixed electrode, an electrolyte and a current-conducting baffle-partition in said electrolyte between said electrodes and normally insulated therefrom, providing means for causing a higher temperature of the electrolyte between the largest areas of the baffle-partition and the positive electrode and lower temperature between the smallest areas exposed.

702,761. BOOK-HOLDER. EDWIN S. ANTHURIALE, Chicago, Ill. Filed Aug. 28, 1901. Serial No. 78,179. (No model.)

Claim.—1. In a book-holder the combination of a back-rest and a lower supporting-ledge, a horizontally-disposed arm secured in and above said back-rest and having a plurality of shoulders thereon, and a hanger

having thereon a stop adapted to engage either of said shoulders, whereby said back-rest may be suspended at different angles of inclination.

2. In a book-holder the combination of a back-rest and a lower supporting-ledge, a horizontally-disposed arm secured to and above said back-rest and having a plurality of shoulders thereon, and an extensible hanger having thereon a stop adapted to engage either of said shoulders, whereby said back-rest may be suspended at different angles of inclination.

3. In a book-holder, the combination of a supporting-frame, a book-rack having a vertically-disposed arm secured to its rear part, the upper part of said arm being bent forward in a horizontally-disposed position and having a plurality of shoulders on said horizontally-disposed part, and a hanger on said frame having thereon a stop adapted to engage either of said shoulders, whereby said rack may be suspended at different angles of inclination.

4. In a book-holder, the combination of an arm 29, a brace 3 hinged to one end of said arm, a hook at the free end of the arm 29, a cross-piece secured to the free end of the brace 2, a tie connecting said free ends, a vertically-adjustable hanger secured to the arm 2 near said hinge, and a book-rack secured to said hanger by adjustable means permitting same to be tilted to different angles of inclination.

5. In a book-holder, the combination of a back-rest and a lower supporting-ledge having an upwardly-projecting pin or shoulder near its forward edge, and a wedge-shaped member acting against said shoulder and toward said back-rest for engaging an interposed book in the manner specified.

6. A book-holder comprising a back-rest, a lower supporting-ledge secured thereto, an arm secured to said back-rest, said arm having its upper part horizontally disposed and provided with a plurality of shoulders and means connected with said back-rest for holding an open book against same.

7. A book-holder comprising a back-rest, a lower supporting-ledge secured thereto, and an arm secured under said ledge and bent upwardly along said back-rest and secured thereto, said arm having its upper part bent forward to a horizontally-disposed position and crimped substantially as shown.

8. In a book-holder, the combination of a back-rest and a lower supporting-ledge, a horizontally-disposed arm secured to and above said back-rest, and a hanger having thereon a stop for supporting said arm at different points of its length and means for securing said arm against its longitudinal shifting on said stop.

702,782. RATCHET-WRENCH. DAVID B. ARNOLD, Terto Haute, Ind., assignor of one-half to Edwin H. Terto Haute, Ind. Filed Mar. 31, 1902. Serial No. 100,801. (No model.)

Claim.—1. In a wrench of the character described, the combination of a head provided with ratchets the teeth of which project in opposite directions, an operating-handle pivoted to the head and provided in its opposite sides with recesses and a transverse bar connecting the inner ends of said recesses, pawls loosely mounted in said recesses, a coiled spring in the bore and acting on reverse ends of the pawls, pivoted buttons or levers engageable with the pawls to hold them out of action or permit them to project and vibrate, and means for securing the levers against movement when adjusted to hold the pawls out of action, substantially as set forth.

2. In a wrench of the character described, the combination of a head provided with ratchets the teeth of which project in opposite directions, an operating-handle pivoted to the head and provided in its opposite sides with recesses and a transverse bar connecting the inner ends of said recesses, pawls loosely mounted in said recesses, a coiled spring in the bore and acting on reverse ends of the pawls, pivoted buttons or levers engageable with the pawls to hold them out of action or permit them to project and vibrate, and means for securing the levers against movement when adjusted to hold the pawls out of action, substantially as set forth.

702,788. BICYCLE-MIRROR. FERN A. AUSTIN, Minneapolis, Minn. Filed May 7, 1900. Serial No. 14,573. (No model.)

Claim.—1. The combination, with a bicycle handle-bar, of a mirror attached to the tip of the grip portion of said bar and included substantially within the circumference of the same.

2. The combination, with a bicycle handle-bar, of a mirror attachment on the end thereof and in continuation of the handle portion, substantially as described.

3. The combination, with a bicycle handle-bar, of a mirror adjustably arranged upon the end of said bar and forming a continuation of the handle portion thereof, as and for the purpose specified.

4. The combination, with a bicycle handle-bar, of a mirror arranged at the end of the grip portion at an angle to the axis thereof and forming a continuation of the handle portion, substantially as described.

5. The combination, with the bicycle handle-bar, of a convex mirror provided at the end of said bar and substantially concentric with the axis thereof, substantially as and for the purpose specified.

6. The combination, with a bicycle handle-bar, of a convex mirror provided upon the end thereof and angularly adjustable thereon, forming a continuation of the handle portion of said bar.

7. The combination, with a bicycle handle-bar, of a ferrule or fastening provided upon the tip end of the grip portion thereof, and a disk mirror provided in said ferrule and supported thereby on said grip portion substantially concentric with the axis thereof, substantially as described.

8. The combination, with a bicycle handle-bar, of a ferrule removably secured on the end of the grip portion thereof, and a convex mirror provided in said ferrule and removable therefrom from said grip portion, substantially as described.

9. The combination, with a bicycle handle-bar, of a convex mirror removably secured to the tip of the grip portion thereof, substantially as described.

10. The combination, with a bicycle handle-bar, of a convex mirror removably secured to the tip of the grip portion thereof, substantially as described.

702,784. PROCESS OF EXTRACTING ZINC. JULIAN L. RAB and ALEXIS TRIGANT, Paris, France. Filed June 28, 1900. Serial No. 22,057. (No specimens.)

Claim.—1. The process herein described of extracting metallic zinc from ores poor in zinc, which consists in forming briquets from a mixture of the ore, carbonate of soda and carbon, subjecting said briquets to the action of heat suitable for driving off the zinc-vapors from said briquets, condensing the said vapors driven off, whereby a condensation product containing zinc acid is formed, mixing said product with carbonate of soda and carbon, subjecting said mixture to a suitable temperature for driving off the metallic zinc in the form of vapors, and condensing said vapors, substantially as set forth.

2. The process herein described of extracting metallic zinc from ores poor in zinc, which consists in forming briquets from a mixture of the ore, carbonate of soda and carbon, subjecting said briquets to the action of heat suitable for driving off the zinc-vapors from said briquets, condensing said vapors, whereby a condensation product containing zinc acid is formed, mixing said product with carbonate of soda and carbon, subject-

ing the mixture to a temperature of from 800° to 1,000° centigrade for about two hours, and condensing the vapors of metallic zinc distilling off therefrom, substantially as set forth.

702,785. PILLOW-SHAPE HOLDER. WILLIAM RABENHUT, Volta, Cal. Filed Oct. 22, 1891. Serial No. 79,422. (No model.)

Claim.—1. The combination, of a rotatably-mounted shaft, a pillow-shape frame slidably mounted thereon to move transversely thereof, and a latch for holding the frame in raised position.

2. The combination, of a rotatably-mounted shaft, a pillow-shape frame carried thereby to slide transversely thereof, said frame comprising transverse rods sliding on the shaft, and end bars fastened to and connecting together the said rods.

3. The combination, of a rotatably-mounted shaft, a pillow-shape frame carried thereby to slide transversely thereof, said frame comprising transverse rods sliding on the shaft, and end bars fastened to and connecting together the said rods, and a latch-arm fastened to the top bar and extending downward to the lower bar to engage the shaft and hold the frame raised.

4. The combination, of a rotatably-mounted shaft, a pillow-shape frame slidably mounted thereon to move transversely thereof, and releasable means for holding the frame stationary on the shaft.

702,786. PNEUMATIC STACKER. JOHN B. BARTHOLOMEW, Peoria, Ill., assignor, by mesne assignments, to Avery Manufacturing Company, Peoria, Ill., a Corporation of Illinois. Filed Mar. 15, 1894. Re-noved Feb. 14, 1902. Serial No. 94,184. (No model.)

Claim.—1. In a pneumatic stacker the combination with the straw-jester mechanism and the dust, of a deflector for the outer end of the dust, a power device for automatically moving the deflector relatively to the dust, and means for automatically varying the path of the deflector, substantially as set forth.

2. In a pneumatic stacker the combination with the straw-jester and the straw-dust, of a deflector movable relative to the dust, power device for simultaneously moving the dust and moving the deflector relatively to the dust, and means for varying the path of the deflector simultaneously with its movement, substantially as set forth.

3. In a pneumatic stacker the combination with the straw-jester and the straw-dust, of power devices for horizontally rotating the straw-dust, the deflector movable relative to the dust, power devices connected to the dust for moving the deflector relatively to the dust, and means for automatically varying the path through which the deflector is moved by the last said power devices, substantially as set forth.

4. In a pneumatic stacker the combination with the straw-jester and the rotary base, of the straw-dust mounted on such rotary base, means for horizontally vibrating the said dust, the adjustable deflector, means for permanently adjusting the deflector, power devices supported upon the rotary base for moving the deflector relatively to the dust, and means for automatically varying the path of the deflector after each permanent adjustment, substantially as set forth.

5. In a pneumatic stacker, the combination with the straw-jester and straw-dust, of means for horizontally vibrating the straw-dust, the movable deflector, and automatically-actuated power devices adapted to impart a fast movement and a slow movement to the deflector substantially as set forth.

6. In a pneumatic stacker the combination with the straw-jester and the straw-dust, of the deflector at the outer end of the straw-dust, automatically-actuated means for moving the deflector with a relatively fast speed and automatically-actuated means for moving it with a relatively slow speed relatively to the dust, substantially as set forth.

7. In a pneumatic stacker the combination with the straw-jester, the straw-dust, and the means for horizontally vibrating the straw-dust, of a movable deflector and a two-part power device for moving the deflector relatively to the dust, the two parts of which while in position can

be held apart whereby one part may be made stationary while the other remains normally in motion, substantially as set forth.

8. In a pneumatic stacker the combination of the straw-jester, the straw-dust, the means for horizontally vibrating the straw-dust, a deflector at the outer end of the dust, a two-part power device for moving the deflector and means for throwing one part of the power device out of action while the other part is in motion, substantially as set forth.

9. In a pneumatic stacker the combination with the straw-jester, the straw-dust, and the means for horizontally vibrating the dust of the movable deflector, the pivotal lever, differential gear-wheels, means connecting such gear-wheels with the lever, and means connecting the lever with the deflector, substantially as set forth.

10. In a straw-stacker the combination with the dust for air and straw and the deflector movably supported at the outer end of the dust, of a cord having its two ends fixed independently of the deflector, and having the part intermediate of its ends engaging with a cord-guide on the deflector, and an automatically-adjustable support for one end of such cord whereby the path of movement of the deflector may be automatically caused to vary, substantially as set forth.

11. In a straw-stacker the combination with the dust for the passage of air and straw and the deflector movably supported at the outer end of said dust, of the cord connected to the deflector and attached to a movable cord-holder, and means for automatically adjusting the position of the cord-holder to vary the movement of the deflector, substantially as set forth.

12. In a straw-stacker the combination of the dust for air and straw, the deflector movably supported at the outer end of the dust, a vibrating cord-holder and means for varying the path of travel of the cord-holder, for varying the travel of the deflector, substantially as set forth.

13. In a pneumatic stacker the combination of the dust for air and straw, the deflector movably supported to the dust, a cord connected to the deflector, a vibrating cord-holder, means for automatically vibrating the cord-holder and means for adjusting vertically the dust and simultaneously adjusting the position of the vibrating cord-holder, substantially as set forth.

14. In a straw-stacker the combination of the dust for air and straw, the deflector movably supported across the path of the straw, the cord connected to the deflector and having one part connected to an automatically-moving and adjustable cord-holder and another part detachably connected to a supplemental holder adapted to permit adjustment of the cord by hand, substantially as set forth.

15. In a straw-stacker the combination of the dust for air and straw, a vertically-swinging support for said dust, a deflector movably supported

in the path of the straw, a deflector-moving device, power mechanism for actuating the deflector-moving device and means for automatically varying the path of the deflector-moving device in correspondence with the vertical adjustments of the straw-dust, substantially as set forth.

16. In a straw-stacker the combination with the dust for air and straw, the deflector movably supported in the path of the straw and means for adjusting the dust to different positions vertically, the means for automatically moving the deflector across the path of the straw and means actuated by the dust-adjusting device for varying the path of the deflector, substantially as set forth.

17. In a straw-stacker the combination with the thrasher and separating mechanism, the straw-ejecting mechanism, the dust for the straw communicating with the ejector at a relatively high point, device accessible from the ground for adjusting the dust vertically, the deflector movably supported across the path of the straw, means for automatically moving the deflector across said path and means actuated by the dust-adjusting device for varying the path of travel of the deflector, substantially as described.

18. The combination with the separating mechanism and its casing, of the straw-ejector arranged inside of but adjacent to one side of said casing, the straw and chaff receptacle extending from the ejector to the oppositely-lying wall and having the downwardly-inclined bottom extending from the left said wall to the eye of the ejector and the upwardly-extending conveyor arranged to carry the chaff from the winnowing upward to the said receptacle, and the supplemental conveyor for the straw arranged to deliver it to the said receptacle, substantially as set forth.

19. In a stacking mechanism, the combination of the rotary base, the stacking device mounted thereon, rotating device engaging with the base, a clutch for reversing the rotating mechanism, power device for actuating the rotating mechanism and the clutch hand device for actuating the rotating mechanism and the clutch, and a supplemental clutch interposed between the rotating device and hand device, substantially as set forth.

20. The combination of the dust, a deflector for the outer end of the dust, a power device at the forward or inner end of the dust for automatically moving the deflector relatively to the dust, and automatically-acting means for varying the path of the deflector.

21. The combination of the extensible dust, a deflector for the outer end of the dust, a power device at the forward or inner end of the dust for automatically moving the deflector relatively to the dust, and means for varying the path of the deflector acting irrespective of the extension or retraction of the dust.

22. The combination of the dust, a deflector for the outer end of the dust, an inwardly and outwardly moving part, means for actuating the same, a cord connecting the deflector with said movable part, and means for automatically varying the operative length of the movement of said part.

23. The combination of the dust, a deflector for the outer end of the dust, an inwardly and outwardly movable arm, means for actuating the same, a cord connecting the deflector with said movable arm, and means for varying the operative length of said arm.

702,767. OIL-MEASURE. GEORGE R. BURNHAM, St. Louis, Mo. Sept. 2, 1901. Serial No. 74,064. (No model.)

Claim.—1. The combination with a measuring-tank, a check-holder and a check-extractor, of means within the tank locking said extractor against movement until a predetermined amount of fluid has been introduced into the tank.

2. The combination with a measuring-tank having an inlet and an

outlet, and an outlet-valve, of a check-holder, and means for extracting checks from said holder and operating said valve adapted to be released for actuation by a predetermined amount of fluid introduced into the measuring-tank.

3. The combination with a measuring-tank having an inlet and an outlet, and an outlet-valve, of a check-holder, means for extracting checks from said holder and operating said valve, released by a predetermined amount of fluid introduced in the measuring-tank.

4. In a measure of the class described, the combination of a tank having an inlet and an outlet, an outlet-valve, an apertured slide, a bell-crank forming connection between said slide and said outlet-valve and occupying an aperture in said slide, means for holding said slide in its inner position, and means for holding said slide in its outer position, substantially as described.

5. In a measure of the class described, the combination of a tank provided with an inlet and an outlet, an outlet-valve, an apertured slide, a bell-crank forming connection between said slide and said valve and occupying an aperture in said slide, a hook carried by said slide, a swinging hook adapted for engagement with said slide-hook, and a float having connection with said swinging hook, substantially as described.

6. In a measure of the class described, the combination of a tank provided with an inlet and an outlet, an outlet-valve, a slide having connection with said valve, a hook carried by said slide, a swinging hook adapted to engage said slide-hook, and having a rearwardly-extending arm, a float connected to said arm, and a perforate wall in which said float is arranged to move, substantially as described.

7. In a measure of the class described, the combination of a tank provided with an inlet and an outlet, an outlet-valve, an apertured slide having connection with said valve, means for holding said slide when in its inner position, a float, and a stem carried by said float adapted to enter an aperture in said slide when the slide is in its outer position, substantially as described.

8. In a measure of the class described, the combination of a tank having an inlet and an outlet, an outlet-valve, a slide having connection with said valve, a check-holding pocket located above said slide, said slide being provided with an opening adapted to receive checks from said pocket for the extraction thereof, substantially as described.

9. In a measure of the class described, the combination of a tank having an inlet and an outlet-valve, means for actuating said valve, a hook arranged for engagement with said valve-actuating means, a float carried by said hook, and a wall in which said float is seated, said wall being provided with a perforate bottom, substantially as set forth for the purpose set forth.

10. In a measure of the class described, the combination of a tank having an inlet and an outlet, an outlet-valve, means for actuating said valve, a float, a stem carried by said float adapted to engage said valve-actuating means, a cup in which said float is seated, said cup having an opening at the lower end thereof through which oil may enter and escape in the rise and fall of said float, substantially as set forth for the purpose set forth.

702,768. CHAIR. HARRY W. BOLLEN, Port Washington, Wis. Filed Dec. 12, 1901. Serial No. 65,868. (No model.)

Claim.—1. In a chair-spider, a spreader provided with intersecting spider-arm seats, combined with spider-arms mounted in said seats.

2. In a chair-spider, a spreader provided with spider-arm seats disposed at an angle to each other, combined with spider-arms mounted in the seats.

3. In a chair-spider, a spreader provided with spider-arm seats located in different planes and intersecting each other, combined with spider-arms located in the seats, the said spider-arms terminating in the same plane in attaching ends.

4. In a chair-spider, a spreader provided with intersecting extended seats grooved to receive spider-arms, combined with intersecting spider-arms mounted in and secured to said seats.

5. In a chair-spider, a hollow adjusting-arc provided with an integrally-cast base at its upper end having upwardly-disposed standards and at one side thereof seats, combined with a spreader having depending ears, a pin passing through the ears and standards, notches formed in the ears, a bowed bridge-piece engaging the notches, a threaded adjusting-bolt passing through, a hand-nut on the end of the bolt, a cross-piece having seats on the other end thereof, springs interposed between

the seats of the base and those of the cross-piece, and means for attaching the spreader to a chair.

6. In a chair-spider, an adjusting-arc, a base at the upper end thereof provided with upwardly-disposed perforated standards, and between the same with spring-receiving seats, combined with a spreader having means of attachment to a chair and provided with depending perforated ears having notches, a pin passing through the ears and perforated standards, an adjusting-bolt, a cross-piece carried thereby and having seats, springs interposed between the seats of the cross-piece and those of the base, a bridge-piece seated in the notches of the ears and having an eye receiving the adjusting-bolt, and a hand nut or wheel mounted on the bolt beyond the bridge-piece.

702,769. CHAIR-SPIDER. HARRY W. BOLLEN, Port Washington, Wis. Filed Mar. 7, 1902. Serial No. 67,060. (No model.)

Claim.—1. The combination, in a chair-spider, of a spreader provided with a pair of spider-arm seats located in the same horizontal plane and at an angle to each other, and spider-arms located in said seats and terminating in the same plane in attaching ends.

2. The combination, in a chair-spider, of a spreader provided with a pair of right-angularly-disposed spider-arm seats located in the same horizontal plane and substantially U-shaped in cross-section, and spider-arms located in the seats, said arms being semicircular or substantially U shape in cross-section and conforming to their seats and at their extremities terminating in attaching ends.

3. The combination, in a chair-spider, of a substantially U-shaped yoke, the opposite side standards of which are provided with deep-notches, a spider-frame having depending ears pivoted between the standards, said spider-frame having a rear longitudinally-disposed seat extending beyond the ears and opposite the recesses on their under sides forming stop-logs for limiting the backward tilt of the spider, a transverse nut intersecting the said longitudinal seat of the spider, and spider-arms mounted upon and fitting the seats.

702,770. NUT-LOCK. THOMAS G. BURNHAM, Summit, N.H. Filed Jan. 26, 1902. Serial No. 61,160. (No model.)

Claim.—A nut-lock, one member of which consists of a washer having one corner portion turned to form a tube, the other member consisting of a spring-cutter movable in the tube, the inner end of the cutter when in position being arranged to be engaged by the nut to force it outward when the nut is turned for tightening, substantially as specified.

702,771. CLAMP. CHARLES A. REHART, Wakefield, Mass., assignor to Consolidated Safety Pin Company, Wakefield, N. J., a Corporation of New Jersey. Filed Aug. 26, 1901. Serial No. 73,646. (No model.)

Claim.—1. In a clamp, the combination with a U-shaped frame, of a clamping-jaw loosely hung or pivoted within said frame, and an operating-lever pivoted on one member of the frame and having a finger which positively engages said jaw both to open and to close the same, substantially as shown and described.

2. In a clamp, the combination with a U-shaped frame, of a clamping-jaw loosely hung or pivoted within said frame and having a shoulder, and an operating-lever pivoted on one member of the frame and having a finger to engage said shoulder to open the jaw, substantially as shown and described.

3. In a clamp, the combination with a U-shaped frame, of a clamping-jaw loosely hung or pivoted within said frame and having a bridge-piece struck up to form shoulders, and an operating-lever pivoted on one member of the frame and having fingers to straddle said bridge-piece and engage said shoulders, substantially as shown and described.

4. In a clamp, the combination with a U-shaped frame, of a clamping-jaw loosely hung or pivoted within said frame, and an operating-lever having a part looped around a portion of the frame and other parts bent down to form fingers to engage said jaw, substantially as shown and described.

5. In a clamp, the combination with a U-shaped frame, of a clamping-jaw having its inner end curved to fit within said frame and swing therein, and an operating-lever pivoted on one member of the frame and having a finger which positively engages said jaw both to open and to close the same, substantially as shown and described.

6. In a clamp, the combination with a U-shaped frame, having legs near its curved part, of a clamping-jaw having its inner end curved to fit within said frame loosely and formed to engage said legs, and an operating-lever pivoted on one member of the frame and having a finger which positively engages said jaw both to open and to close the same, substantially as shown and described.

702,772. ACETYLENE-GAS GENERATOR. JOHN D. BUCKLEY and EDWARD H. FERNET, Brunswick, Me. Filed Aug. 26, 1901. Serial No. 73,760. (No model.)

Claim.—1. In an acetylene-gas generator, the combination with the carbide-holder, of an escape-pipe communicating with the said carbide-holder, a valve in said escape-pipe, a cover for said carbide-holder, studs projecting laterally from said cover, a pivoted yoke-shaped locking-lever having curved arms to engage said studs when the valve is closed, and a connection between said locking-lever and the valve for actuating said valve to allow the escape therefrom of the gas within the carbide-holder previous to the disconnection of said cover from the curved arms, substantially as set forth.

2. In an acetylene-gas generator, the combination with the generating-tank, of a carbide-holder communicating therewith, a valve for controlling the communication between the two and provided with a crank-arm, a generator, a jointed bar connected to said crank-arm and the dome of the generator, a lock for holding the two parts of the jointed bar rigid, a cover for the carbide-holder, means for locking the cover in position, and means connected to the first-named means for unlatching and "breaking" the jointed bar, substantially as set forth.

3. In an acetylene-gas generator, the combination with the generating-tank, of a carbide-holder communicating therewith, a valve for controlling the communication between the two and provided with a crank-arm, a gnometer, a jointed bar connected to said crank-arm and to the dome of the gnometer, a lock for holding the two parts of the jointed bar rigid, a cover for the carbide-holder, means for locking the cover in position, means connected to the first-mentioned means for "breaking" the jointed bar when the cover is unlocked, and a valve escape-pipe communicating with said carbide-holder, the valve thereof being connected with the first-mentioned means and adapted to be opened thereby in the act of unlocking the cover from the carbide-holder, substantially as set forth.

4. In an acetylene-gas generator, the combination with the generating-tank, of a carbide-holder communicating therewith, a valve for controlling the communication between the two and provided with a crank-arm, a gnometer, a jointed bar connected to said crank-arm and to the dome of the gnometer, a lock for holding the two parts of the jointed bar rigid, a cover for the carbide-holder, a locking-lever for said cover, a crank connected to said locking-lever, and a connection between said crank and the means for locking the jointed bar, whereby when said locking-lever is moved to release the cover from the carbide-holder, the locking means will unlock and break the jointed bar and permit of the closing of the valve by the further movement of the locking-lever, substantially as set forth.

5. In an acetylene-gas generator, the combination with the generating-tank, of a carbide-holder communicating therewith, a valve for controlling the communication between the two and provided with a crank-arm, a gnometer, a jointed bar connected to said crank-arm and to the dome of the gnometer, a stud projecting from one member or part of the jointed bar into and adapted to cooperate with a recess or notch in the edge of the other member, a link carried by the notched or recessed member and adapted to engage said stud and lock the two members rigidly together, a cover for the carbide-holder, a locking-lever for said cover, a crank secured to said locking-lever, and a connection between said crank and the said link for releasing said link from said stud when said locking-lever is swung to a position to permit of the removal of said cover, substantially as set forth.

6. In an acetylene-gas generator, the combination with the generating-tank thereof provided with a vent-pipe, a valve located therein, a draw-off cock located at the bottom of the tank and provided with a handle, a lever for operating the valve, a filling-pipe leading into the tank and provided with a valve, a bar connected to said valve and projecting downward into the path of movement of the handle of the draw-off cock to form an interference for said handle while the valve of the vent-pipe is closed and thus permit of the opening of the draw-off cock, and the valve in the filling-pipe only when the valve in the vent-pipe is open, substantially as set forth.

702,773. BURIAL-ROBE. HENRY K. BUNNEN, Omaha, Neb. Filed Mar. 24, 1902. Serial No. 95,757. (No model.)

Claim.—1. A burial-robe, open at front and provided with an opening at the back from its upper edge downward for a suitable distance, the portion of the garment to one side of the rear opening carrying a complete collar, and means for securing the collar in position, substantially as described.

2. A burial-robe, open at front and provided with an opening at the back from its upper edge downward for a suitable distance, the portion of the garment to one side of the rear opening provided with an integral complete collar, means for securing the collar in position, and fastening means for securing the garment in position in front, substantially as described.

3. A burial-robe, open at front and provided with an opening at the back extending from the upper edge thereof downwardly for a short distance, the portion of the garment to one side of the rear opening provided with an integral complete collar, one end of the collar projecting

beyond the edge of the garment, so that it can be adjusted to fit any size neck, and fastening-strings for drawing and holding the ends of the collar to position, and fastening means for securing the garment in front, substantially as described.

4. A burial-robe, open at front and provided with an opening at the back extending from the upper edge thereof downwardly for a short distance, the portion of the garment to one side of the rear opening provided on its inner side with a plurality of vertically-arranged fastening means which engage fastening means on the vertical edge of the other portion of the robe on the other side of the rear opening, and another set of vertically-arranged fastening means on the edge of the first-mentioned portion of the garment, which engage fastening means arranged on the second-mentioned portion of the garment, said latter fastening means being located back of the edge fastening means, and a fold carried by the second-mentioned portion which laps over and conceals the last-mentioned fastening means, and means for securing the garment at the neck, substantially as described.

5. A burial-robe, open at front and provided with an opening at the back extending from the upper edge thereof downwardly for a short distance, a portion of the garment to one side of the rear opening provided with an integral complete collar, fastening-strings for drawing and holding the ends of the collar to position, and portion of the garment provided on its inner side with a plurality of vertically-arranged fastening means, which engage fastening means on the vertical edge of the other portion of the garment on the other side of the rear opening, and another set of vertically-arranged fastening means on the edge of the first-mentioned portion of the garment, which engage fastening means arranged on the second-mentioned portion of the garment, said latter fastening means, and a fold carried by the second-mentioned portion which laps over and conceals the last-mentioned fastening means, and means for securing the garment at the neck, substantially as described.

702,774. BASK-BASTONER OR MOLDER. JAMES W. CAMP, Mount Carmel, S. C., assignor to Charles B. Cowan, Dumas, S. C. Filed July 24, 1901. Serial No. 68,585. (No model.)

Claim.—1. In a window holding and locking device, the combination with a fixed rod, of a pivoted locking-lever the free end of which embraces the rod, and a weighted lever pivotally connected to the locking-lever and adapted to counterbalance and overbalance the latter, substantially as described.

2. In a window holding and locking device, the combination with a fixed rod, of a pivoted locking-lever having an opening through which the fixed rod passes, a weighted lever pivotally connected to the locking-lever, and a stud for controlling the position of the weighted lever with relation to the locking-lever, substantially as described.

3. In a window holding and locking device, the combination with a fixed rod, of a pivoted locking-lever having an opening with parallel sides through which the fixed rod passes and having recesses, and a weighted lever pivoted to the locking-lever, said weighted lever having a stud adapted to engage the recesses for controlling the position of the weighted lever, substantially as described.

702,775. PROTECTION OF DRIVING-CHAINS. ERNEST CASSE-ROSE, Deal, England. Filed Feb. 27, 1902. Serial No. 95,855. (No model.)

Claim.—1. The combination with an endless chain, of a series of protecting devices, each consisting of a shield or plate extending across one edge of the side bars of the link, and the space between said bars, and having means engaging the opposite edges of the side bars of the link.

2. The combination with a chain-link, of a shield or plate extending across the space between the side bars of the link, and arms projecting from opposite sides of said plate and having lugs engaging with the side bars of the link.

3. The combination with a chain-link, of a shield or plate extending across the space between the side bars of the link and having arms extending across said side bars and engaging the edges thereof opposite those adjacent the shield or plate.

4. The combination with a chain-link, of a shield or plate extending across the space between the side bars of the link, and arms extending across said side bars and connected at one end to said plate and provided at their opposite ends with lugs that extend across the edges of said side bars opposite those adjacent the shield or plate.

5. As an article of manufacture, the herein-described chain-link protector, consisting of a shield or plate adapted to extend across the space between the side bars of a chain-link, and arms connected to said plate and provided with means for engaging with the edges of the side bars of the link opposite those adjacent said plate.

6. As an article of manufacture, the herein-described chain-link protector consisting of a shield or plate adapted to extend across the space between the side bars of a chain-link, and arms projecting from opposite sides of said plate, to extend across the side bars of a link and having at their ends inwardly-extending lugs adapted to engage with the edges of said side bars opposite those adjacent the shield or plate.

702,776. FRUIT-BOX. WILLIAM CLARK, Troy, Mich. Filed Mar. 12, 1902. Serial No. 97,905. (No model.)

Claim.—1. A multiple-blank box comprising in its construction a strip adapted to be bent upon itself and connected at its ends, and a bottom substantially circular in form and adapted to protrude through apertures in the strip, whereby when the free ends of the strip are connected, the box will be substantially polygonal in plan.

2. A multiple-blank box comprising in its construction a strip adapted to be bent upon itself and connected at its ends by a locking-tongue, and a bottom substantially circular in form and adapted to protrude through apertures in the strip and to bear against the tongue.

3. A multiple-blank box comprising in its construction a strip adapted to be bent upon itself and connected at its ends by a two-membered locking-tongue, and a bottom substantially circular in form and adapted to protrude through apertures in the strip and to bear against the lower member of the tongue.

4. A multiple-blank box comprising in its construction a strip provided with two series of apertures, one series of which constitutes venting-apertures, said strip being adapted to be bent upon itself and connected at its end by a locking-tongue, and a bottom substantially circular in form and adapted to protrude through the other series and to bear against the tongue.

5. A multiple-blank box comprising in its construction a strip adapted to be bent upon itself and connected at its ends by two two-membered locking-tongues, the lower terminals of which are disposed respectively near the center and the lower portion of the strip, and a bottom and a partition substantially circular in form and adapted to protrude through apertures in the strip and to bear against the lower terminals of the locking-tongues.

6. A fruit-box comprising a body and a lid, one of which is constructed of a strip bent upon itself and connected at its ends by a locking-tongue, and an end substantially circular in form and adapted to protrude through apertures in the strip and to bear against the tongue.

702,777. WATCH-PROTECTOR. JAMES COWEN, New York, N. Y. Filed Oct. 20, 1901. Serial No. 95,695. (No model.)

Claim.—The combination with a pocket consisting of front and rear flaps or walls, of a watch protector or guard consisting of two parallel bars hinged together and of less length than the opening into the pocket, the hinged end approximately coinciding with the side seam of the pocket, the bars being secured respectively to the front and rear flaps of the pocket, the rear bar having an offset portion forming an opening for the watch-chain, and a fastening device for the bars at the ends opposite the hinge, substantially as described.

702,778. LIFTING-TRUCK. BARBARA COLBERT, Chicago, Ill. Filed Jan. 8, 1902. Serial No. 93,682. (No model.)

Claim.—1. In a truck, the combination of a frame, a lever pivoted to said frame, a pair of bars or clamps adapted to engage the load and means operated by said lever for automatically projecting the bars forward to engage the load and raising said bars after engagement with the load.

2. In a truck the combination of a rectangular bed-frame open at one side, standards on said frame, vertically-slidable rack members in said standards, levers pivoted to said standards and connected by links to said sliding members, pinions mounted on said standards and engaging said racks, horizontally-slidable racks engaging the unslotted ends of said pinions, vertical rods rigidly secured to said racks, engaging with bearings on vertical lifting-bars, and links connecting said bars with the vertically-slidable members.

3. The combination in a lifting-truck of lifting-bars a vertically-slidable rack member, a pinion operated by said member, a rack-bar operated by a unslotted portion of said pinion to project the lifting-bars, and links connecting said lifting-bars and vertically-slidable member substantially as described.

702,779. REVOLVING CHIMNEY-CAP. ANNA E. COOK and FREDERICK J. COOK, Lawrenceburg, Ind. Filed May 25, 1901. Serial No. 91,922. (No model.)

Claim.—1. In a chimney-cap, the combination, with a lower head-section having openings therein and adapted for attachment to a stack or to a chimney, and a vertical shaft secured to said head-section, the upper end of which shaft is pointed, of an upper section open at the top and mounted to revolve upon the said pointed portion of the shaft and around the lower head-section, the upper section being in two connected members inclined in the same direction at opposite sides of the vertical axis of the cap from the head-section upward and having more or less conical outer faces, ball-bearings provided for the upper sections of the cap, the balls whereof engage with the said shaft, a screw within the upper section, extending from the said ball-bearings, and a weight adjustable upon the said screw, for the purpose set forth.

2. In a chimney-cap, the combination, with a lower head-section of spider formation, having means for attachment to a chimney or to a stack, a shaft secured to the said head-section at its lower end, the upper end of the shaft being conical, a cap-screw mounted upon the conical end of the shaft,

and a tube detachably connected to the cap-screw at its upper end, of a ball-bearing located around the lower portion of the shaft, the balls whereof engage with the shaft, the said tube supporting the said bearing, a screw extended from said bearing, a weight adjustable upon the screw, and an upper revolvable portion for the cap attached to the said cap-screw, and free to turn at its lower end around the lower head-section of the cap, as set forth.

2. In a chimney-cap, the combination, with a lower head-section of spiral formation, having means for attachment to a chimney or to a shaft, a shaft secured to the said head-section at its lower end, the upper end of the shaft being conical, a cap-screw mounted upon the conical end of the shaft, and a tube detachably attached to the cap-screw at its upper end, of a ball-bearing located around the lower portion of the shaft, the balls whereof engage with the shaft, said tube supporting the said bearing, a screw extended from said bearing, a weight adjustable upon the screw, an upper revolvable portion for the cap attached to said cap-screw, and free to turn at its lower end around the lower head-section of the cap, the said upper portion of the cap consisting of a casing which is directly attached to the cap-screw and a member of lighter material secured to the casing, the entire revolvable section having a slope from the bottom upward in direction of one side of the lower head-section, as described.

702,780. BEE-TRAY. WINFIELD DARLINS, South Benning, N. Y.
Filed Nov. 2, 1901. Serial No. 81,867. (No model.)

Claim.—1. In a pedigree egg-tray, the combination of an incubating-tray, provided with an open bottom and movable partitions; a nursery-tray with a solid bottom and movable partitions; and, an independent partition to divide the two trays and to serve for a cover for the latter, all substantially as shown and described and for the purposes set forth.

2. In combination with a nursery-tray, of an incubating-tray adapted to be placed over the nursery-tray, the movable partitions of each being adapted to be placed in alignment with each other, substantially as shown and described, and for the purposes set forth.

3. In a pedigree egg-tray, the combination, of the incubating-tray and the nursery-tray each formed with an outer rim and divided into compartments with an independent partition to be used between them, all substantially as shown and described.

702,781. LINO-TYPE-MACHINE. PHILIP T. DODGE, Washington, D. C., assignor to Mergenthaler Linotype Company, a Corporation of New York. Filed Feb. 11, 1902. Serial No. 96,694. (No model.)

Claim.—1. In a distributing mechanism, a carrier-screw, having its threads provided with longitudinal distributing-teeth, varied in arrangement at different points in the length of the screw, substantially as described and shown.

2. In a distributing mechanism, a matrix-carrying distributing-screw, having its threads tapered in cross-section and provided on their two sides with distributing-teeth following the course of the thread and varied in arrangement at different points in their length, whereby they are adapted to deliver differing matrices at different points.

3. In a distributing mechanism, a distributor-screw having a thread of varying cross-section at different points in its length, in combination with a series of matrices having their upper ends notched in varying forms to engage the thread of the screw, whereby the screw is adapted to carry said matrices in succession and to deliver them at different points.

4. In a distributing mechanism, a carrier-screw having a thread of tapering section, with permuted distributing-teeth on its sides, and with a widened outer edge *P* reduced in width at intervals, as described.

5. In a distributing mechanism, a screw having a toothed matrix-carrying thread, the teeth on each turn differing from those on the next, substantially as described and shown.

6. In a distributing mechanism, a carrying-screw, having its thread provided with permuted teeth, substantially as described, in combination with means for reciprocating the screw in an axial direction.

7. In combination with a screw having permuted distributing-teeth on the sides of its thread, means for moving the screw endwise in opposition to the trend of the screw when the screw is in position to release the matrices, whereby the tendency of the screw to advance the matrices is neutralized and longer time afforded for the delivery of the matrices.

8. In combination with a distributor having a rotary toothed screw, substantially as described, a cam applied thereto, and a cooperating device, whereby the cam is caused to shift the screw endwise.

9. The supporting-frame, the distributing-screw having a toothed thread, mounted to rotate and reciprocate in said frame, the grooved cam on said screw, and the fixed device engaging said cam, whereby end motion of the screw is effected during its rotation.

10. In a distributing mechanism, the combination of a carrying-screw having its thread provided with distributing-teeth, and the magazine-rails *K*, having their upper ends arranged in position to receive the matrices as they are released from the screw.

11. In a distributing mechanism, a screw having its thread provided with distributing-teeth, in combination with mechanism substantially as shown for presenting the matrices successively with their toothed ends in position to engage the screw-thread.

12. The carrying-screw provided with distributor-teeth, in combination with a pusher device *F* for advancing the line of matrices beneath the screw, and a lifting device *H* for presenting the matrices successively in position to engage the screw.

13. In combination with a screw provided with distributing-teeth, a matrix-stop *G*, a feed device *F*, and a lifting device *H*, substantially as shown.

14. In combination with the toothed distributor-screw *C* and its cam *J*, the matrix-feeding slide *H*, subject to the depressing influence of the cam, and a spring *I* acting in opposition to the cam to RA the slide.

15. In combination with the toothed distributor-screw, an underlying matrix-support *L* and magazine-rails *K*, terminating below the screw and above the support, substantially as shown.

16. In combination with the toothed distributor-screw and a feed-slide *H*, a series of matrices having their upper ends reduced in thickness and provided with teeth, substantially as shown.

702,782. LINO-TYPE-MACHINE. PHILIP T. DODGE, Washington, D. C., assignor to Mergenthaler Linotype Company, a Corporation of New York. Filed Feb. 17, 1902. Serial No. 94,697. (No model.)

Claim.—1. The distributor-bar, in combination with an adjacent

toothed feed-bar and means for imparting rotary and reciprocating movements to said bar.

2. In combination with the distributor-bar, a device for feeding the matrices along said bar, consisting of two conical transverse-toothed members, and means for rotating them and reciprocating them in reverse directions, whereby they are caused to engage and advance the matrices.

3. In a distributing mechanism, a feed device consisting of a bar or shaft extending lengthwise of the mechanism and transversely toothed on one side, means for rotating the bar to throw its teeth into and out of engagement with the matrices, and means for reciprocating the bar endwise that it may advance the matrices.

4. In a distributor, two complementary conical transverse-toothed members, transversely toothed, in combination with means for rotating them and means for reciprocating them in reverse directions, whereby they are caused alternately to engage and advance the matrices.

5. In a distributing mechanism, a transversely-toothed rotating member, in combination with means to cause longitudinal reciprocation of said member.

6. In a distributing mechanism, a longitudinal distributor, in combination with a plurality of parallel shafts transversely toothed, and means for rotating them and moving them endwise in unison.

7. Two conical transverse-toothed bars, mounted to turn about a common axis, in combination with rollers thereon and means co-operating with the rollers to reciprocate the bars endwise in reverse directions.

8. In a distributing mechanism, a transversely-toothed bar, mounted to reciprocate endwise and to turn transversely; whereby it is adapted to engage and disengage the matrices by a rolling motion and to advance them by a longitudinal motion.

702,783. LINO-TYPE-MACHINE. PHILIP T. DODGE, Washington, D. C., assignor to Mergenthaler Linotype Company, a Corporation of New York. Filed Mar. 24, 1902. Serial No. 96,700. (No model.)

Claim.—1. In a distributing mechanism, a feed-screw and means for imparting thereto an axial reciprocation and a continuous rotation.

2. A feed-screw and means for imparting thereto an axial reciprocation and a rotary motion in one direction.

3. In a distributing mechanism, the combination of a toothed distributor-bar to hold the matrices in suspension, a plurality of feed-screws adjacent thereto, and means for rotating said screws and moving them axially.

4. In a distributor in combination with a distributor-bar, rotary feed-screws lying parallel therewith, each carried by said screws to effect their longitudinal movement, and fixed studs or rollers engaging said cams.

702,784. POULTRY-ROOST. JOHN E. F. EVANS, Wakefield, Wash. Filed Mar. 1, 1902. Serial No. 96,594. (No model.)

Claim.—1. A poultry-roost comprising supporting-bar for the fowl, and spacers secured thereon to keep the fowl apart, each spacer having a depending arm extending lengthwise under the supporting-bar, for supporting a vermin-carrier, as set forth.

2. A poultry-roost having a combination spacer and supporting-arm, the latter depending from the spacer and extending approximately in vertical alignment thereto, the said arm having retaining means for a vermin-carrier, as set forth.

3. A poultry-roost having a combination spacer and supporting-arm,

the latter depending from the spacer and extending approximately in vertical alignment thereto, the said arm having retaining means for a vermin-carrier, as set forth.

4. A poultry-roost comprising a supporting-bar for the fowl, a spacer provided with means for attaching it to the top of the supporting-bar, and an arm integral with the spacer and depending therefrom, and extending lengthwise under the supporting-bar, as set forth.

5. A poultry-roost comprising a supporting-bar for the fowl, a spacer provided with means for attaching it to the top of the supporting-bar, and an arm integral with the spacer and depending therefrom, and extending lengthwise under the supporting-bar, the arm being corrugated at the free end for retaining a cloth carrying the verminicide, as set forth.

6. A poultry-roost having a combination spacer and supporting-arm formed of a single piece of wire, bent into a loop, one end of which terminates in a point engaging an eye on the other end of the loop, the eye terminating in the depending portion of the supporting-arm, as set forth.

702,785. GRINDING-MACHINE. WILLIAM E. FETTER, Wyomere, Ohio. Filed Mar. 7, 1902. Serial No. 97,000. (No model.)

Claim.—1. A grinding-machine comprising a shaft, a grinding-wheel mounted to rotate with said shaft and to move longitudinally thereof, a feeding-shaft provided with a screw-thread, a sleeve movable on said feeding-shaft, a spring-pressed pin carried by the sleeve for engaging with the screw-thread, and a connection between said sleeve and the grinding-wheel, substantially as specified.

2. A grinding-machine comprising a shaft, a grinding-wheel mounted to rotate with said shaft and movable longitudinally thereof, a threaded feeding-shaft, a sleeve mounted on said feeding-shaft and operated by the thread thereof, a connection between said shaft and the grinding-wheel, an arm carried by said connection, and a spring-pressed finger pivoted to the arm, substantially as specified.

3. A grinding-machine comprising a main frame, a shaft, spring-pressed boxes in said frame and in which the shaft has bearings, a grinding-wheel mounted to rotate with said shaft and having a longitudinal movement thereof, a screw-shaft having bearings in the frame, a sleeve on said screw-shaft, a spring-pressed pin carried by said sleeve and engaging with the thread of the screw-shaft, an arm extended from said sleeve and having engagement with the hub of the grinding-wheel, a guide carried by said arm, and an adjustable frame in the lower portion of the main frame, substantially as specified.

4. A grinding-machine comprising a main frame, a shaft having bearings in said main frame, a grinding-wheel mounted to rotate with said shaft and having a longitudinal movement thereof, a screw-shaft, a sleeve mounted on the screw-shaft and having connection with the grinding-wheel, a pin movable in the sleeve for engaging with the screw-shaft and

means for driving the two shafts, the first-named shaft having a faster movement than the second shaft, substantially as specified.

702,786. THREAD-DRESSING MACHINE. GEORGE A. FRIEDMAN, Pawtucket, N. I. Filed Jan. 7, 1902. Serial No. 33,904. (No model.)

Claim.—1. In a thread-dressing machine, the combination of a trough, a rod properly mounted, a lever centrally mounted loosely on said rod and having a chambered hub provided with a barf on its edge, a fixed collar on said rod and provided with a wedge-shaped projection capable of engagement with said barf, a second fixed collar on said rod and provided with a tubular projection which enters said chambered hub, a spiral spring in the chambered hub surrounding the rod and bearing against the projection of the second-named collar, and a grooved wheel at the lower end of said lever, substantially as described.

2. In a thread-dressing machine, a twister consisting of a vertical shaft properly mounted and having two parallel standards extending up from the upper end thereof, means adapted to rotate said shaft, a beveled gear secured to a horizontal shaft which is mounted in said standard, a roller fastened upon said horizontal shaft and a second roller mounted loosely in said standards and rotatable by friction of the first-named roller and suitable thread-guides, in combination with a fixed beveled gear upon another support in engagement with the first-named beveled gear, said last-named beveled gear and said vertical shaft being radially slotted to allow the passage of a thread to its geometrical center, and means adapted to prevent said thread from having said slots, substantially as specified.

3. In a thread-dressing machine, the combination of a bracket or frame having a tubular bearing, and provided with a V-shaped radial opening at its bottom, a beveled gear fixed upon said tubular bearing and having in its hub a central bore in line with the bore of said bearing, a sleeve or tube loosely mounted in the bore of said beveled gear and bearing and provided with a longitudinal slot and with a handle which projects through the radial opening, a vertical shaft having a radial longitudinal slot and mounted rotatably in said tube or sleeve, a gear upon the lower end of said vertical shaft, a circular disk integral with said vertical shaft upon the upper end thereof, which disk has a radial slot and runs upon the web of said fixed beveled gear, two parallel standards extending up from said disk and integral therewith, which standards have a horizontal slot extending on one side inwardly, a roller fastened on said horizontal shaft, a beveled gear on the end of said horizontal shaft and in mesh with the fixed beveled gear, a second roller mounted rotatably in the slot of said standards and in frictional contact with the first-named roller, a thread-guide on the top of said standards, and gearing rotated by power in mesh with the gear at the bottom of said vertical shaft, substantially as shown.

4. In a thread-dressing machine, the combination of two steam-cylinders rotatable and mounted on a hollow shaft which is adapted to discharge steam therein, a plurality of steam-pipes mounted rotatably at their ends respectively in said steam-cylinders and opening therein, a

cylindrical brush fixedly mounted on each of said steam-pipes, means adapted to rotate said steam-cylinders, and means adapted to rotate each of said brushes and the hollow shafts thereof, substantially as set forth.

5. In a thread-dressing machine, the combination of two steam-cylinders mounted upon a hollow shaft which is adapted to discharge steam therein, means adapted to rotate said steam-cylinders at the same speed, a plurality of steam-pipes mounted at their ends respectively in said steam-cylinders and opening therein, a cylindrical brush fixedly mounted on each of said steam-pipes, and means adapted to rotate each of said brushes and the hollow shafts thereof at a greater speed than that of the said steam-cylinders, substantially as described.

6. In a thread-dressing machine, the combination of a frame, two brackets secured upon the frame and each having a tubular bearing, two steam-cylinders one of which has a short tubular hub and the other of which has a long tubular hub mounted in one of said bearings, a pulley on said long cylindrical hub and adapted to be rotated by a belt, a tubular shaft connecting said two steam-cylinders, a shaft contained in the tubular shaft last named and having its center solid but its two ends tubular with each of said tubular ends provided with a hole adapted for the passage of steam between it and the adjacent steam-cylinder, a plurality of tubular shafts mounted rotatably in said two steam-cylinders and each opening at or near its end into said two steam-cylinders, a cylindrical brush fixedly mounted on each of said tubular shafts, a pulley having a long tubular hub by which it is mounted rotatably in the other of said bearings and through which one of the tubular ends of the second-named shaft extends, which pulley-hub enters into the adjacent steam-cylinder, a belt to rotate the last-named pulley, a gear upon the lower end of said pulley-hub and fastened thereto, a gear having a diameter less than that of the last-named gear fastened upon the end of each of said plurality of tubular shafts of the brushes and engageable with the gear which is upon the lower end of said pulley-hub, and a steam-pipe connected with each tubular end of the second-named shaft, substantially as specified.

7. In a thread-dressing machine, the combination of two rotatable disks mounted upon a proper support and a plurality of rollers mounted at their ends respectively on said disks, levers having tubular hubs by which they are mounted fast on said rollers, respectively, means to rotate said disks, and means to rotate said rollers, substantially as shown.

8. In a thread-dressing machine, the combination of two steam-cylinders rotatable and mounted on a tubular shaft which is adapted to discharge steam therein, a plurality of tubular shafts mounted rotatably at their ends in said steam-cylinders and opening therein, levers having tubular hubs by which they are mounted fast on said tubular shafts last mentioned, respectively, means adapted to rotate said two steam-cylinders and means adapted to rotate said last-named tubular shafts, substantially as set forth.

9. In a thread-dressing machine, the combination of two steam-cylinders rotatably mounted on a tubular shaft which is adapted to discharge steam therein, means adapted to rotate said two steam-cylinders at the same speed, a plurality of tubular shafts mounted rotatably at their ends in said steam-cylinders and opening therein, levers having tubular hubs by which they are mounted fast upon said tubular shafts last mentioned, respectively, and means adapted to rotate each of said levers-shafts at a greater speed than that of the said steam-cylinders, substantially as specified.

10. In a thread-dressing machine, the combination of a frame, two brackets secured upon said frame and each having a tubular bearing, two steam-cylinders one of which has a short tubular hub and the other of which has a long tubular hub mounted in one of said bearings, a pulley on said long tubular hub and adapted to be rotated by a belt, a tubular shaft connecting said two steam-cylinders, a shaft contained in the tubular shaft last mentioned and having its center solid but its two ends tubular with each of said tubular ends provided with a hole adapted for the passage of steam between it and the adjacent steam-cylinder, a plurality of tubular shafts mounted rotatably in said two steam-cylinders and each opening at or near its end into said two steam-cylinders, levers having tubular hubs by which they are mounted fast upon the tubular shafts last mentioned, respectively, a pulley having a long tubular hub by which it is mounted rotatably in the other of said bearings and through which one of the tubular ends of the second-named shaft extends, which pulley-hub enters into the adjacent steam-cylinder, a belt to rotate the last-named pulley, a gear upon the lower end of said pulley-hub and fastened thereto, a gear having a diameter less than that of the last-named gear fastened upon the end of each of said levers-shafts and engageable with the gear which is upon the lower end of said pulley-hub, and a steam-pipe connected with each shaft, substantially as specified.

11. In a thread-dressing machine, the combination of thread-twisting, thread-brushing, thread-winding and thread-winding devices, with a traversing mechanism for the thread-winding means consisting of a horizontal traverse-roll having thread-eyes contiguous to the winding-spools, a driving-pulley deriving motion and power from the main shaft of the

machine, a shaft properly mounted and rotated by said pulley, a beveled gear mounted on each end of said shaft, a traverse-shaft mounted at each end of the machine, a beveled gear on each traverse-shaft meshing with the first-named beveled gear, a crank-arm on the end of each traverse-shaft, a guide-rod extending from each end of the traverse-roll, two vertical standards on the top of the machine, each provided with a vertical opening or passage through which one of said guide-rods extends, and a link pivotally connected with the end of the adjacent crank-shaft and also pivotally connected with the end of the adjacent guide-rod, substantially as specified.

702,787. PLATE-PRINTING AND ENDOSSING PRESS. WILLIAM WILLARD, COLUMBIA, Pa. Assignor, by direct and mesne assignments, to Pullard Manufacturing Company, Philadelphia, Pa., a Corporation of New Jersey. Original application filed Mar. 27, 1901. Serial No. 33,922. Divided and this application filed May 31, 1901. Serial No. 33,474. (No model.)

Claim.—1. In a plate-printing and endossing press, a die-plunger, a lever, connections between the lever and plunger, an arm attached to said connections, means for imparting movement to said lever, and means for imparting motion to said arm, whereby a quick movement will be imparted to said plunger.

2. In a plate-printing and endossing press, a die-plunger, a lever, connections between the lever and plunger, a rod connected with said lever, an eccentric contacting with said rod adapted to impart movement thereto, an arm attached to said connections, and a cam adapted to operate said arm.

3. In a plate-printing and endossing press, a die-plunger, connections between said plunger and a suitable support, an arm suitably connected with said connections, a shaft, means on said shaft for imparting motion to said arm, a gear on said shaft, and means for imparting motion from a main gear, whereby the first-named gear will move faster than the main gear.

4. In a plate-printing and endossing press, a die-plunger, connections between the same and a suitable support, an arm connected with said connections, rollers on said arm, a shaft, a cam on said shaft adapted to contact with said rollers, a gear on said shaft, an intermediate gear meshing with said gear, and a main gear meshing with said intermediate gear, whereby said first-named gear-shaft is adapted to revolve faster than the said main gear.

5. In a plate-printing and endossing press, a die-plunger, a lever, connections between said plunger and lever, a main gear, means for imparting motion thereto, a main shaft, an eccentric thereon, a rod connected with said eccentric, a lever, an arm connected with said connections, rollers on said arm, a shaft, a cam thereon adapted to contact with said rollers, and a gear mounted on said shaft adapted to impart motion thereto.

6. In a plate-printing and endossing press, a die-plunger, a lever, connections between said plunger and lever, a rod connected with said lever, means for imparting movement to said rod, an arm connected with said connections, rollers on said arm, and a cam adapted to engage said rollers and operate said arm.

7. In a plate-printing and endossing press, a die-plunger, a lever, connections between said plunger and lever, means for operating said le-

ver, means intermediate said plunger and lever, whereby an additional motion of quick nature may be imparted to said plunger.

8. In a plate-printing and endossing press, a lever, a die-plunger, means for imparting motion to said lever, a yielding connection intermediate of said plunger and lever, and means for imparting proper motion to said connection, whereby an additional movement of quick nature will be imparted to said plunger.

702,788. CLOTH-CUTTER. DANIEL GUNTER, Berlin, Germany. Filed Feb. 10, 1902. Serial No. 33,430. (No model.)

Claim.—1. In a machine of the class described, the combination of a lower casing, a cutter mounted therein, an upper casing rotatably mounted upon the lower casing, a driving-shaft mounted in the upper casing, and connecting mechanism between the driving-shaft and the cutter.

2. The combination of a lower casing, an upper casing, a driving-shaft mounted in the upper casing, a shaft 17, mounted in the lower casing, a vertical shaft connecting the driving-shaft and the shaft 17, a shaft 20, a cutter upon the shaft 20, and gearing connecting the shaft 17 and the shaft 20.

3. The combination of a lower casing provided with an opening, an upper casing mounted upon the lower casing and provided with a downwardly-extending hollow pivot, which projects into the opening in the lower casing, a vertical shaft mounted within the hollow pivot, a driving-shaft connecting with the upper end of the vertical shaft, a cutter mounted in the lower casing, and connections between the vertical shaft and the cutter.

4. The combination of a lower casing, provided with an opening, an upper casing mounted upon the lower casing, and provided with a downwardly-extending hollow pivot, a vertical shaft mounted within the hollow pivot, a hubbing also secured within the opening of the lower casing around the vertical shaft, a driving-shaft mounted within the upper casing and connected to the vertical shaft, a shaft 17 mounted in the lower casing and connected to the vertical shaft, a spur-wheel carried by the shaft 17, a shaft 20, a spur-wheel smaller than the one upon the shaft 17, mounted upon the shaft 20, and a cutter also mounted upon the shaft 20.

702,789. DILATOR. CHARLES G. GIBSON, Sioux City, Iowa. Filed Mar. 20, 1902. Serial No. 33,105. (No model.)

Claim.—1. A dilator for surgical purposes, comprising a tube open at both ends, a plurality of segments or bars, the bore of the said tube being widened at one end, a plunger movable lengthwise in the tube and arranged to engage the said widened end of the body of the tube to expand said tube, and an expansible sheath in which the said tube is housed.

2. A dilator for surgical purposes, comprising a tube split so as to consist of a plurality of segments or bars, the bore of the said tube being gradually widened in direction of one end, a plunger movable lengthwise in the tube and arranged to engage said widened end and the body of the tube to expand said tube, a nut held to revolve at the outer end of the tube and engaging a threaded portion of the plunger-rod, and an expandable sheath in which the said tube is inclosed.

3. A dilator for surgical purposes, comprising a split tube, a plunger movable lengthwise in the tube and arranged to expand the same, means for actuating the plunger, and an expandable sheath in which the said tube is inclosed.

4. A dilator for surgical purposes, comprising a split tube having its bore tapered in direction of its forward end, the diameter of the bore of the said tube at its forward end being greater than at any other point throughout its length, a plunger movable lengthwise in the tube and arranged to expand the same, means for actuating the plunger, and an expandable sheath in which the said tube is inclosed.

5. A dilator for surgical purposes, comprising a split tube, a handle at the outer end of said tube, a nut mounted to turn on the tube adjacent to the handle, a plunger mounted to slide within the tube and adapted to expand the same, said plunger having a screw-threaded rod extending through the nut, and an expandable sheath in which said tube is inclosed.

702,790. MUSTACHE-GUARD. RICHARD C. GLADWIN, Oakland, Cal. Filed Nov. 20, 1901. Serial No. 93,369. (No model.)

Claim.—A device of the character described comprising two comb members flexibly connected together at their inner adjacent ends, and guard-plates, of approximately the same size as the comb members, flexibly connected to the bottoms of said comb members and adapted to fold upwardly thereupon; substantially as described.

702,791. ELECTRIC-ARC-LAMP REFLECTOR-SHADE. WISDOM E. COLLMANSON, Lafayette, Ind. Filed Sept. 13, 1900. Serial No. 30,426. (No model.)

Claim.—1. The combination with a non-flaming source of light, of a reflector, the reflecting-surface of which is disposed with reference to the light source so as to receive the light-rays emanating therefrom within given angles to the horizontal, and uniformly to reflect the same to points within given limits, irrespective of the vertical shifting of the light source, substantially as described.

2. The combination with a non-flaming source of light, of a reflector, the reflecting-surface of which is disposed at an angle of approximately four degrees to the horizontal and so arranged relative to the light source that it will receive the light-rays emanating therefrom, within given angles to the horizontal, and uniformly reflect the same to points on the ground within given limits, irrespective of the vertical shifting of the light source, substantially as described.

3. The combination with a non-flaming source of light, of a reflector, the reflecting-surface of which is so disposed with reference to the light source that it will receive the light rays emanating therefrom between the angles of twenty-five degrees and forty degrees to the horizontal and uniformly reflect the same to points on the ground between fifty feet and one hundred feet distant, irrespective of the shifting of the light source within the usual limits, substantially as described.

4. The combination with a non-flaming source of light, of reflecting-surfaces arranged at such an angle as uniformly to receive the light-rays emanating from the light source within given angles in the horizontal and to reflect the same within given limits, irrespective of the shifting of the light source within a vertical plane, substantially as described.

5. A reflector formed with a reflecting-surface adapted to direct light-rays in a downward and outward direction, and having a central opening, the said opening being provided with a covering of translucent material,

whereby light-rays from above may be diffused to points beneath the reflector, substantially as described.

6. The combination with a source of light, of a reflecting-surface so arranged relative to the light source as to distribute the strongest light-rays to points distant, and having a central opening covered with a translucent medium, whereby a portion of the light-rays will be evenly diffused, thus reducing the intensity of any shadow of the reflecting-surface, substantially as described.

7. The combination with a source of light, of an upper and lower reflecting-surface, the upper reflecting-surface being so arranged with relation to the light source as to reflect the strongest upper light-rays to points distant and the weaker light-rays to points comparatively near, the lower reflecting-surface being so arranged relative to the light source as to reflect the strongest lower light-rays to points distant, and having a central opening covered with a translucent medium, whereby the light-rays from above will be evenly diffused to points more immediately beneath, and means for supporting said reflecting-surfaces relative to the light, all co-operating to effect a reduction and concentration of the light-rays within given limits and to reduce the intensity of any shadows from parts of the apparatus, substantially as described.

702,792. LAWN-SPRINKLER. HOWARD H. GRAY, Huntington, Ind. Filed Aug. 14, 1901. Serial No. 73,081. (No model.)

Claim.—1. A sprinkler comprising an annular supporting-frame, a rotatable frame supported thereby, a propeller-wheel supported by said rotatable frame, an intermediately-pivoted hose-supporting clamp adapted to travel around said propeller-wheel, and means carried by the rotatable frame for oscillating said hose-clamp, substantially as described.

2. A sprinkler comprising an annular supporting-frame, a propeller-wheel supported by the inner periphery of said supporting-frame, a rotatable frame mounted therein, a centrally-located vertical shaft carried by said rotatable frame, a worm-gear carried by the rotatable frame and driven by said shaft and meshing with the gear on the supporting-frame, a propeller-wheel carried by the upper end of said shaft, and a hose-clamp carried by said rotatable frame and adapted to travel around said propeller-wheel, substantially as described.

3. A sprinkler comprising an annular stationary member having cage upon its inner periphery, a revolvable member carrying a worm-gear in engagement with the said cage, a revolvable shaft being operatively connected with the worm-gear, substantially as described.

4. A sprinkler comprising an annular horizontal stationary member having cage upon its inner periphery, an annular revolvable member supported thereby, a worm-gear carried by the revolvable member, a vertically-arranged shaft supported by the revolvable member, a propelling member connected with the said shaft, the shaft and worm-gear being operatively connected, and the worm-gear in engagement with the said cage, of the stationary annular member, and a nozzle or hose support, substantially as described.

5. A sprinkler comprising an annular horizontal stationary member having cage upon its inner periphery, a circular horizontal revolvable member supported thereby, a vertically-arranged worm-gear carried by the revolvable member and meshing with the said cage, a vertically-arranged revolvable shaft carried by the revolvable member and having a worm-gear in engagement with the said vertically-arranged wheel, a propeller-wheel attached to said shaft, and an eccentrically-arranged hose clamp or support carried by the said revolvable member, substantially as described.

6. A sprinkler comprising an annular horizontal stationary member having cage upon its inner periphery, a revolvable member carrying a worm-gear in engagement therewith, a propelling member carried by the revolvable member and operatively connected with the said worm-gear, and an eccentrically-arranged hose or nozzle carrier connected with the said revolvable member, substantially as described.

7. A sprinkler comprising a supporting member, a rotatable member supported thereby, a propeller-wheel carried by the rotatable member, a worm-gear in engagement with the supporting-frame, means carried by

one side of said worm-gear by means of which it is driven, a hose-supporting clamp carried by said member, and means carried by the opposite side of said worm-gear for oscillating said hose-clamp, substantially as described.

8. A sprinkler comprising an annular supporting member, a revolvable member, a wheel journaled therein and having a worm, engaging cage formed upon the inner periphery of the annular member, a vertically-arranged shaft carrying a worm in engagement with said cage carried by the side of said wheel, a propeller-wheel carried by the upper end of said shaft, a hose-clamping member pivotally connected to said revolvable frame, and an eccentric connected in the side of said wheel and connected in the hose-clamping member, substantially as described.

9. A sprinkler comprising an annular horizontal stationary member having cage upon its inner periphery, a circular horizontal revolvable member supported thereby, a vertically-arranged wheel carried by the revolvable member and having a worm-gear meshing with the said cage, a vertically-arranged revolvable shaft carried by the revolvable member and having a worm-gear in engagement with the cage carried by one side of said vertically-arranged wheel, a propeller-wheel attached to the upper end of said shaft, an eccentrically-arranged pivoted hose-clamp, and an eccentric carried by the opposite side of said vertically-arranged wheel and connected to the said hose-clamp, substantially as described.

10. A sprinkler comprising a supporting-frame, a rotatable frame supported thereby, a propeller-wheel carried by the rotatable member, an intermediately pivoted hose-clamp, and means operated by the propeller-wheel for revolving the rotatable member and oscillating said hose-clamp, substantially as described.

11. A sprinkler comprising an annular supporting-frame, a rotatable member supported thereby, a centrally-located propeller-wheel carried by the said rotatable member, means operated by the said wheel for engaging the inner periphery of the stationary member and rotating the revolvable member, an intermediately-pivoted hose-clamp carried by the revolvable member, and means operated by the propeller-wheel for oscillating said hose-clamp, substantially as described.

702,798. DIFFERENTIAL GEARING. CARL E. G. HANSEN, Bergedorf, near Hamburg, Germany. Filed Dec. 3, 1900. Serial No. 31,243. (No model.)

Claim.—1. The combination with a driving-shaft, an eccentric thereon, a wheel on said eccentric and rollers carried at the periphery of said wheel; of an internally-toothed drum larger than said wheel, the rollers of which are arranged to engage the teeth on said drum during the revolution and rotation of the wheel, a driven shaft concentric with the driving-shaft, a spider thereon and a link connection between said spider and wheel, substantially as and for the purpose set forth.

2. The combination with a driving-shaft, an eccentric thereon, a wheel on said eccentric and rollers carried by the wheel; of a drum, provided with an undulating inner surface, larger than said wheel, the rollers of which are adapted to travel over said undulating surface, a driven shaft concentric with the driving-shaft, a spider thereon and a connection between the wheel and spider capable of revolving and rotating, substantially as and for the purpose set forth.

702,794. ANTI-SLIPPING PAD FOR HORSE FEET. THOMAS F. HAYES, New York, N. Y. Filed Dec. 3, 1901. Serial No. 94,517. (No model.)

Claim.—1. An anti-slipping pad for horse feet, the same comprising a base of soft-leather or like soft material having openings therein,

headed pins studding the base, a filler of rubber or like cushioning material overlying the base and secured thereto near its outer edge leaving the intermediate portion free to move according as the air is forced to enter or leave by way of the said openings in the base, a protective piece of canvas or like textile placed over the filler, and means for securing the pad to the horse's foot, substantially as specified.

2. An anti-slipping pad for horse feet, the same comprising a base of soft-leather or like soft material having openings therein, headed pins studding the base, a filler of rubber or like cushioning material overlying the base and secured thereto and having the side next to the base ribbed, a protective piece of canvas or like textile placed over the filler, a flap projected from the rear of the base to extend upward in the rear of the horse's foot, and crossed straps having connection with the front of the base and the rear corners of the said flap, substantially as set forth.

702,795. CENTRIFUGAL SEPARATOR. EDGAR V. BOLAND, Chicago, Ill. Filed Nov. 1, 1900. Serial No. 735,495. (No model.)

Claim.—1. A centrifugal separator comprising a revolvable drum having at one end an inlet, a centrally-arranged hub, a ring surrounding said hub and separated from said hub and the interior of the drum to form respectively inner and outer outlet-passages, an outlet-chamber in communication with the inner passage, and a surrounding chamber in communication with the outer outlet-passages, substantially as described.

2. A centrifugal separator comprising a revolvable drum having at one end an inlet, a centrally-arranged hub, a ring surrounding said hub at the opposite end of the drum, outlet-passages located respectively at the inner and outer edges of the ring, a chamber below the ring in communication with the inner outlet, a member in said chamber adapted to arrest the motion of the liquid, said chamber having upwardly and downwardly extending outlets, substantially as described.

3. A centrifugal separator comprising a revolvable drum having at one end an inlet, the opposite end having relatively inner and outer outlet-passages, a member provided with an outlet-passages having a forcing-worm in communication with said inner outlet-passages, substantially as described.

4. A centrifugal separator comprising a revolvable drum having at one end an inlet-passages, the opposite end of the drum having relatively inner and outer outlet-passages, a stationary chamber in communication with the inner outlet, stationary wings in said chamber, and the chamber having oppositely-extending outlet-passages, substantially as described.

5. A centrifugal separator comprising a revolvable drum having at one end an inlet-passages and at its opposite end relatively arranged inner and outer outlet-passages, a centrally-arranged hollow hub, a chamber at one end of the hub in communication with the inner outlet-passages, one

end of the hollow hub in communication with said chamber and the opposite end of the hub having a communication extending outside of said drum, substantially as described.

6. In combination, a revoluble drum having a hub, concentric pipes extending through the hub, a chamber below the hub in communication with the lower end of the inner pipe, the outer pipe having passages at the upper end of the drum and in communication therewith, the upper ends of the pipes extending outside of the drum, substantially as described.

7. In combination, a revoluble drum having a central hub, the outlet end of the drum having outlet-passages located, respectively adjacent the hub and the inner side of the wall of the drum, a shell located below the hub and having open ends, the upper end of the shell in communication with the inner outlet-passages, and a casing surrounding the shell and communicating with the outer outlet-passages, substantially as described.

8. In combination, a revoluble drum, a bowl-shaped extension for the lower end of the drum, an annular bottom supported by the said bowl-shaped extension, the said bottom having peripheral outlet-passages, substantially as described.

9. In combination, a revoluble drum having at its lower end a bowl-shaped extension, the exit end of the drum connected with said extension, the extension constituting a chamber with open upper and lower ends, the exit end of the drum having concentric annular outlet-passages, the inner outlet-passages in communication with the upper end of said chamber, and a worm connected with said extension and located in the lower open end thereof.

10. In combination, a revoluble drum, a centrally-arranged rotatable hub, laterally-extending partitions connecting the said hub and drum, a casing surrounding the said drum the upper end of the drum having a drum inlet-opening, the said casing provided with an inwardly-extending projection engaging the wall of the drum inlet-opening, a ring-like bottom for the said drum having its outer periphery out of contact with the inner side of the said drum, and its inner periphery out of contact with the said hub, constituting concentric annular outlet-passages, a bowl-shaped extension at the lower end of the drum and connected therewith through the medium of the said bottom, a bottom for the said opening having an annular passage surrounding the said bowl-shaped extension of the drum and in communication with the outer annular outlet-passages substantially as described.

11. In combination, a revoluble drum having a central hub with a central non-rotary outlet-pipe extending through the said hub and ending at a point below the same, a chamber located below the hub and in communication with the said pipe, and wings located in said chamber and connected with the said non-rotary pipe, substantially as described.

12. In combination, a hub, a concentrically-arranged drum having an exit end, laterally-extending partitions connecting the hub and the drum and serving to support the latter, the exit end of the drum disconnected with the wall thereof, said exit end having respectively inner and outer passages, the drum having an extension provided with a supporting-bearing, the said extension being out of contact with the wall of the said drum, substantially as described.

702,796. SHOCK-LOADING APPARATUS. AARON C. HOUTSMA, Iowa. Filed Dec. 11, 1901. Serial No. 95,481. (No model.)

Claim.—1. A portable loading apparatus comprising a wheeled truck, a reversible derrick having the extendible and non-extendible legs pivoted to the truck and adapted to be shifted from side to side thereof, means for extending or contracting the extendible leg and thereby imparting the reversible or shiftable adjustment to the derrick, and a hoisting mechanism mounted on the derrick and shiftable therewith from one side to the other of the truck.

2. A portable loading apparatus comprising a truck, a reversible derrick having its members pivoted to the truck and shiftable from side to side thereof, means for giving the shiftable or reversible adjustment to said derrick, and a hoisting-cable guided on the derrick for adjustment therewith and operable by the advancing movement of the apparatus.

3. A portable loading apparatus comprising a truck, a derrick having its legs pivoted to the truck, means for adjusting the derrick and shifting it from one side to the other of the truck, an arm mounted on the derrick and shiftable therewith to project from either side of the truck and a hoisting-cable guided by the arm and operable by the advancing movement of the apparatus.

4. A portable loading apparatus, comprising a wheeled truck, a reversible derrick mounted thereon to swing from one side to the other of the truck, a crank supported on the derrick to be shiftable therewith and also capable of an independent movement thereon, and a hoisting-cable operatively related to the crane and adapted to be operated by the travel of the apparatus.

5. A portable loading apparatus provided with a reversible derrick, a crane carrying a sheave and mounted on the derrick to be adjusted there-

with and also capable of an independent movement thereon, and a hoisting-cable attached at one end to said crane and reeved through the sheave thereon.

6. A portable loading apparatus, comprising a wheeled truck, a derrick reversibly mounted on said truck for adjustment from side to side thereof, a yieldable or elastic crane-arm mounted on said derrick for adjustment therewith, and a hoisting-cable operatively related to said crane-arm.

7. A loading apparatus comprising a wheeled truck, a derrick reversibly mounted on said truck to be shiftable to either side of the same and provided at its upper end with a bearing, an arched crane swivelled in said bearing of the derrick and adapted to project therefrom in either of the operative positions of the derrick, and a hoisting-cable guided by said crane.

8. A portable loading apparatus, comprising a wheeled truck, a derrick reversibly mounted thereon, an arched yieldable crane-arm swivelled on the upper portion of the derrick and adapted to be shifted therewith and capable of a limited elastic movement under the strain of the load, and a hoisting-cable connected to and guided by said crane-arm.

9. In a loading apparatus, the combination of a portable truck, a shiftable derrick mounted thereon and adapted to assume an operative position on either side of said truck, a swivelled crane mounted on the derrick to be shiftable therewith and arranged to project beyond one side or the other of the platform, and a hoisting-cable extended by the advancing movement of the apparatus.

10. In a loading apparatus, the combination of a wheeled truck, a base-frame mounted on the truck and extending beyond the opposite sides thereof, a shiftable derrick having its legs pivoted on the truck, a crane carried by said derrick, and a hoisting-cable operable by the advancing movement of the apparatus.

11. A portable loading apparatus, comprising a wheeled truck, a shiftable derrick pivotally supported thereon, an arched crane-arm mounted at the head of the derrick for adjustment thereon and adapted to project beyond the truck in either adjusted position of said derrick, guide-sheaves attached to the crane-arm and to the derrick, and a hoisting-cable attached to the crane-arm and reeved through the guide-sheaves.

12. A portable loading apparatus, comprising a wheeled truck, a derrick reversibly mounted thereon to swing from side to side and having pivoted legs and an extendible leg, devices actuated by the travel of the truck and connected operatively with the extendible leg, whereby the members of said leg may be positively moved with relation to one another, and a hoisting mechanism supported by and adjustable with said derrick.

13. A portable loading apparatus, comprising a wheeled truck, a derrick reversibly mounted thereon and having pivoted legs and an extendible leg connected with said pivoted legs, a shaft adapted to be driven by the travel of the truck, a winding-spool on said shaft, and connections between said extendible leg and said spool, whereby the derrick may be shifted in one direction by power device and is adapted to be shifted by gravity in the opposite direction.

14. A loading apparatus comprising a wheeled truck, a derrick reversibly mounted thereon and having an extendible leg, a shaft adapted to be rotated by the travel of the truck, a winding-spool loose on said

shaft, a clutch adapted to make the spool fast with said shaft, and a cable connecting the extendible leg and said spool.

15. In a loading apparatus, the combination of a shiftable derrick having pivoted and extendible legs, power connections for positively extending said legs, and a pull-cable having operative connection with one member of the extendible leg.

16. In a loading apparatus, the combination of a wheeled truck and a derrick thereon, of a hoisting-cable, an endwise-adjustable shaft on the truck, a pulley mounted idly on said shaft and adapted to be driven from one of the truck-wheels, a drum on said shaft, and means whereby the shaft and the drum may be thrown into and out of operation.

17. In a loading apparatus, the combination of a truck, a shiftable derrick, a main shaft, clutch-controlled device driven from said shaft and operatively related to the derrick for shifting the latter, a hoisting-cable, and clutch-controlled device driven operatively related to said shaft and independent of the derrick-shifting mechanism for operating the hoisting-cable.

18. In a loading apparatus, the combination of a truck, a shiftable derrick erected thereon, a hoisting mechanism supported by said derrick, and a guard curved outwardly from and beyond said derrick and projecting into the path of the load adapted to be elevated by the hoisting mechanism.

19. A loading apparatus, comprising a wheeled truck having a platform, and a base-frame on said platform, a derrick mounted on the base-frame, guards arranged at the corners of the base-frame, and a hoisting mechanism supported by the derrick.

702,797. MEANS FOR FACILITATING THE STARTING OF GAS OR SIMILAR ENGINES. JAMES HUTTON, Chamberlain, England, assignor to Messrs. Limited, London, England. Filed May 16, 1902. Serial No. 102,797. (No model.)

Claim.—1. In a combustion-engine having a plurality of working cylinders, the combination with said cylinders of an electrical starting device comprising separate circuits for the several cylinders, said circuits being provided with breaks adapted to be successively closed by the engine when working, and also with breaks adapted to be closed simultaneously with each other by hand.

2. In a combustion-engine having a plurality of working cylinders, the combination with said cylinders and the crank-shaft of an electrical starting device comprising a corresponding number of circuits each of which is broken at two points, means, co-operating with the crank-shaft, for successively closing said circuits at one broken point in each, and hand-operated means for closing simultaneously at the second broken point in each all of said circuits, substantially as and for the purpose specified.

3. In a combustion-engine having a plurality of working cylinders, the combination with said cylinders and the crank-shaft of an electrical starting device comprising circuit-breakers that are in communication with the respective cylinders and each broken at two points, an individual stationary contact-piece in each circuit at one of said broken points, a rotary contact-piece co-operating with the crank-shaft and adapted to make contact successively with said stationary contact-pieces, and a hand-operated

circuit-closer common to all of said circuits and located at the second broken point in each so as to close said second broken points and thus complete one of the circuits, substantially as described.

4. In a combustion-engine having a plurality of working cylinders, the combination with said cylinders and the crank-shaft of a corresponding number of circuit-breakers communicating therewith, said circuits each being broken at two points, a terminal in each circuit at one of said points, an elastic blade contact-piece carried by each of said terminals, a common rotary contact-piece in said circuits, said rotary contact-piece being adapted to co-operate with the crank-shaft so as to successively make contact with the stationary contact-pieces, and a push-commutator to all said circuits and adapted to close the said circuits simultaneously at the second broken point in each for the purpose of completing one of the circuits, substantially as described.

702,798. MIX-FASTENER. JOHAN H. & JOHANSSON, Stockholm, Sweden. Filed Mar. 17, 1902. Serial No. 94,478. (No model.)

Claim.—In a fastening device, the combination with a pivoted loop composed of two spring-arms having loops formed on their free ends, of a catch formed with a base-plate having one bent inwardly and then outwardly at an angle to the base and adapted to receive both arms of the loop above the loops, and a tongue hinged to said base-plate adapted to be projected in the horizontal plane of the arms of the loop, for the purpose specified.

702,799. PLAYING-BALL. ELEANOR KEMPWELL, Boston, Mass., assignor to the Kempwell Manufacturing Company, a Corporation of New Jersey. Filed Apr. 18, 1902. Serial No. 102,008. (No model.)

Claim.—1. A playing-ball comprising a cloth-covered sphere of plastic material, said cover consisting of telescoped hemispherical sections cemented together and embedded in the plastic material and having apertures into which the plastic material protrudes.

2. A playing-ball comprising a cloth-covered solid sphere of gutta-percha, said cover consisting of telescoped hemispherical sections and being embedded in the gutta-percha and having apertures into which the gutta-percha protrudes.

702,800. ARTIFICIAL EAR-DRUM. ULRICH KLEINER, Brookline, Mass. Filed Aug. 6, 1901. Serial No. 71,597. (No model.)

Claim.—1. An artificial ear-drum consisting of a cup, with a flat end, composed of fibrous absorbent material compressed with wax and adapted by its shape and proportion to penetrate and fit the auditory canal.

2. An artificial ear-drum consisting of a truncated cone adapted to penetrate the auditory canal as far as the tympanum, and composed of fibrous absorbent material, the apex whereof is of waxy material.

3. An artificial ear-drum, consisting of a truncated cone adapted to penetrate the auditory canal as far as the tympanum, and composed of fibrous absorbent material having smooth waxy surface.

4. An artificial ear-drum, consisting of a truncated cone adapted to penetrate the auditory canal as far as the tympanum and composed of fibrous absorbent material, reinforced at the apex by a sheet of woven material, the whole compressed into an integral structure with wax and presenting a smooth waxy surface.

5. An artificial ear-drum, consisting of a truncated cone adapted to penetrate the auditory canal as far as the tympanum, and made of a thin sheet of absorbent cotton, compressed with wax and presenting a smooth waxy surface.

6. An artificial ear-drum, consisting of a truncated cone adapted to penetrate the auditory canal as far as the tympanum and made of a thin sheet of absorbent cotton, reinforced at the apex by a piece of woven silk, the whole compressed into an integral structure with wax and presenting a smooth waxy surface.

7. An artificial ear-drum, consisting of a truncated cone adapted to penetrate the auditory canal as far as the tympanum, and composed of fibrous absorbent material into which is incorporated a strip of woven material having frayed edges, in such manner that the apex of the cone is reinforced by the web portion of the said strip and the frayed edges thereof are incorporated with the sides of the cone.

702,801. FOLDING FRAME FOR TRUCKS. PHILIP J. KREMER, Somerton, Ohio. Filed Mar. 17, 1900. Serial No. 98,710. (No model.)

Claim.—1. A folding frame for trucks, &c., comprising four legs, and a lazy-tongs connection between each adjacent pair of legs, both at the sides and ends of the frame, comprising intersecting bars pivotally connected together at their intersection, and also pivotally connected at their lower ends to the lower portions of the legs, and opposite bars pivotally connected to the upper ends of said intersecting bars and to the upper ends of the leg to which the intersecting bar is not attached, substantially as described.

2. A folding truck, comprising four legs, a lazy-tongs connection between each adjacent pair of legs, each connection comprising two intersecting bars pivotally connected at their intersection, and pivotally connected at their lower ends to the lower portions of the legs, and bars pivotally connected to the upper ends of said intersecting bars and to the upper ends of the adjacent legs; with stays connecting the intersecting bars below their intersection.

3. In a frame, the combination of four uprights, a lazy-tongs connection between the adjacent legs at each side and end of the frame, comprising intersecting bars pivoted together at their intersection and pivoted at their lower ends to the opposite legs, and bars pivoted to the upper ends of said legs, and at their inner ends pivoted to the upper ends of the intersecting bars connected to the opposite leg, the top bars at the sides extending beyond the legs; with folding braces connecting the intersecting bars below their points of intersection, and the folding stays connecting the outwardly-extending portions of said bars to the lower ends of the adjacent legs, substantially as described.

4. A folding frame for trucks, &c., comprising four legs, and a lazy-tongs connection between each adjacent pair of legs, both at the sides and ends of the frame, comprising intersecting bars pivotally connected together at their intersection, and also pivotally connected at their lower ends to the lower portions of the legs, and opposite bars pivotally connected to the upper ends of said intersecting bars, and to the upper ends of the leg to which the intersecting bar is not attached; with braces between the upper ends of the legs, substantially as described.

5. A folding truck, comprising four legs, a lazy-tongs connection between each adjacent pair of legs, each connection comprising two intersecting bars pivotally connected at their intersection, and pivotally connected at their lower ends to the lower portions of the legs, and bars pivotally connected to the upper ends of said intersecting bars and to the upper ends of the adjacent legs; with stays connecting the intersecting bars below their intersection; and stays connecting the outwardly-extending portions of said bars to the lower ends of the adjacent legs, substantially as described.

6. A folding truck, comprising four legs, a lazy-tongs connection between each adjacent pair of legs, each connection comprising two inter-

secting bars pivotally connected at their intersection, and pivotally connected at their lower ends to the lower portions of the legs, and bars pivotally connected to the upper ends of said intersecting bars and to the upper ends of the adjacent legs; with stays connecting the intersecting bars below their intersection; and braces connecting the upper ends of the legs.

7. In a frame, the combination of four uprights, a lazy-tongs connection between the adjacent legs at each side of the frame, comprising intersecting bars pivoted together at their intersection and pivoted at their lower ends to the opposite legs, and bars pivoted to the upper ends of said legs, and at their inner ends pivoted to the upper ends of the intersecting bars connected to the opposite leg, the top bars at the sides extending beyond the legs; with folding braces connecting the intersecting bars below their points of intersection, and the folding stays connecting the outwardly-extending portions of said bars to the lower ends of the adjacent legs, substantially as described.

8. In a frame, the combination of the four uprights, the lazy-tongs connection between the adjacent legs at each side and end of the frame, composed of intersecting bars pivoted together at their intersection and pivoted at their lower ends to the opposite legs, and top bars pivoted to the upper ends of said legs, and at their inner ends pivoted to the upper ends of the intersecting bars connected to the opposite leg, the top bars at the sides extending beyond the legs; with folding braces connecting the intersecting bars below their points of intersection, and the folding stays connecting the outwardly-extending portions of said bars to the lower ends of the adjacent legs, and horizontally-disposed foldable braces connecting the upper ends of the legs.

9. In a frame, the combination of the four uprights, the lazy-tongs connection between the adjacent legs at each side and end of the frame, composed of intersecting bars pivoted together at their intersection and pivoted at their lower ends to the opposite legs, and top bars pivoted to the upper ends of said legs, and at their inner ends pivoted to the upper ends of the intersecting bars connected to the opposite leg, the top bars at the sides extending beyond the legs; with folding braces connecting the intersecting bars below their points of intersection, and the folding stays connecting the outwardly-extending portions of said bars to the lower ends of the adjacent legs, and horizontally-disposed foldable braces connecting the upper ends of the legs.

702,802. RETAINING-VALVE. WILLIAM G. LAMB, Mexico. Filed May 7, 1901. Serial No. 98,148. (No model.)

Claim.—1. In a fluid-pressure brake system of the class specified, the combination with the auxiliary reservoir and ordinary triple valve, of the valve mechanism described, consisting of the valve-casing and pipe D and E connecting it with the triple-valve exhaust and auxiliary reservoir as shown, and having a partition with valve-seat at P, the valve J, its spring and adjusting device O, arranged in the upper chamber of the valve-casing the valve being provided with a needle-point seating at P and controlling the air-passage, the second or lower valve G seating upward at a point below the air-outlet a, the piston G' connected with the valve G and arranged above such air-outlet, and acted on by air-pressure from above as shown and described.

2. In a fluid-pressure brake system, the combination with the auxiliary reservoir and the triple valve, of a valve-casing having an atmospheric vent therein, a means establishing communication between the triple-valve exhaust and the valve-casing, a valve located in the valve-casing, said valve controlling communication between the triple-valve exhaust and the vent in the casing, a connection between the valve-casing and the auxiliary reservoir, and a second valve within the valve-casing, the second valve being controlled by the auxiliary-reservoir pressure and commanding a passage in the valve-casing through which passage the auxiliary-reservoir pressure may pass to actuate the first-named valve.

702,808. SPRING-CLAMP FOR LENSES OR THE LIKE. EMIL L. LEMMER, New York, N. Y. Filed Dec. 26, 1901. Serial No. 97,282. (No model.)

Claim.—1. A spring-clamp for lenses and the like made of a single piece of spring-wire, and comprising registering front and rear mem-

bers clamping opposite faces of the lens, each member being formed to inclose a free portion of the lens adjacent to the edge thereof, and a connecting portion connecting at each end with an end of the free members to leave the other ends of the free members free, as set forth.

2. A spring-clamp for lenses and the like made of a single piece of spring-wire, and comprising registering front and rear members clamping opposite faces of the lens, each member being formed to inclose a free portion of the lens adjacent to the edge thereof, a connecting portion connecting at each end with an end of the free members to leave the other ends of the free members free, and a pivot-pin integral with the end of one of the free members for the temple to swing on, as set forth.

3. A spring-clamp for lenses and the like made of a single piece of spring-wire, and comprising registering front and rear members clamping opposite faces of the lens, each member being formed to inclose a free portion of the lens adjacent to the edge thereof, a connecting portion connecting at each end with an end of the free members to leave the other ends of the free members free, a pivot-pin integral with the end of one of the free members for the temple to swing on, and a piece of rubber tubing on one of the free members, as set forth.

702,804. BICYCLE. GEORGE H. LEAHMAN, New York, N. Y. Filed Apr. 13, 1900. Serial No. 712,448. (No model.)

Claim.—1. A driving mechanism comprising a power-drum having a clutch driving device, a strap connection having one end secured to and winding upon and off said drum, an auxiliary drum on which an intermediate portion of said strap winds at one end and off which it winds at the other end to vary the diameter of the strap on said auxiliary drum and consequently the speed or power, said drum also forming a means for projecting a portion of the strap sideways from the frame and clear of the operator's legs, a stirrup secured to and supported by another portion of said strap and by which the strap is unwound from the power-drum to rotate it in one direction, and means for reversing the motion of said power-drum to wind the strap thereon, substantially as described.

2. A driving mechanism comprising a power-drum having a clutch driving device, a strap connection having one end secured to and winding upon and off said drum, means for securing and holding stationary the other end of the strap, a stirrup having a roller journaled therein immediately over the free-opening of the frame, and about which an intermediate portion of the said strap passes, and by means of which and of said stirrup the said strap is unwound from the power-drum to rotate it in one direction, and means for reversing the motion of the power-drum to wind the strap thereon, substantially as described.

3. A driving mechanism comprising a power-drum having a clutch driving device, a strap connection having one end secured to and winding upon and off said drum, means for securing and holding stationary the other end of the strap, a set of jointed links pivoted at one end of the set to the frame and carrying a stirrup or pedal having a roller or pulley journaled therein at the other end of the set and about which an intermediate portion of the said strap passes and by means of which the said strap is unwound from the said drum to rotate it in one direction, and means for reversing the motion of said drum to wind the strap thereon, substantially as described.

4. A driving mechanism comprising a power-drum having a clutch driving device, a strap connection having one end secured to and winding upon and off said drum, means for securing and holding stationary the other end of the strap, a set of tubular joints having guide rollers or pulleys at their joints and pivoted at one end of the set to the frame and carrying a stirrup or pedal having a roller or pulley journaled therein at the other end of the set, an intermediate portion of said strap passing about said rollers or pulleys and through said tubular joints, by means of which the said strap is unwound from said drum to rotate it in one direction, and means for reversing the motion of said drum to wind the strap thereon, substantially as described.

5. A driving mechanism comprising a power-drum having a clutch driving device, a strap connection having one end secured to and winding upon and off said drum, means for securing and holding stationary the other end of the strap, an auxiliary drum for projecting the strap clear of the frame in which drum portions of said strap wind, said drum, by the differing diameters of its end, effecting means for meeting varying requirements of speed and power, a set of tubular joints having guide rollers or pulleys at their joints and pivoted at one end of the set to the frame, and carrying a stirrup or pedal having a roller or pulley journaled therein at the other end of the set, an intermediate portion of said strap passing about said rollers or pulleys and through said tubular joints by means of which the said strap is unwound from said power-drum to rotate it in one direction, and means for reversing the motion of said power-drum to wind the strap thereon, substantially as described.

6. A driving mechanism having duplicate sets of driving means located upon each side of the part to be driven and each comprising a power-drum having a clutch driving device, a strap connection having one end secured to and winding upon and off said drum, means for securing and holding the other end of the strap connection, a footpiece engaging said strap connection and supported thereby, by which the strap is unwound from said drum to rotate it in one direction, and means for positively connecting the duplicate sets of driving means to work respectively, so that the unwinding of the strap from the power-drum on one side will wind the strap upon the power-drum on the other side, substantially as described.

7. A driving mechanism having duplicate sets of driving means located upon each side of the part to be driven and each comprising a power-drum having a clutch driving device, a strap connection having one end secured to and winding upon and off said drum, means for securing and holding the other end of the strap connection, a footpiece engaging said strap connection and supported thereby, by which the strap is unwound from said drum to rotate it in one direction, and means whereby the duplicate sets of driving means can be positively connected to work respectively, so that the unwinding of the strap from the power-drum on one side will wind the strap upon the power-drum on the other side; or can be disconnected to work separately, so that each set is independent of the other entirely at the will of the operator, substantially as described.

8. A variable-speed driving mechanism, comprising a power drum, means for imparting the forward motion of said drum to the part to be driven, a strap connection having one end secured to and winding upon and off said drum, a storage device receiving and holding the other end of the strap normally stationary, by which the amount of strap wound upon said power-drum is controlled, a footpiece engaging said strap connection and supported thereby, by which the strap is unwound from said power-drum to rotate it in one direction, and means for reversing the motion of the power-drum to wind the strap thereon, substantially as described.

9. A variable-speed driving mechanism having duplicate sets of driving means located upon each side of the part to be driven, and each comprising a power-drum having a clutch driving device, a strap connection having one end secured to and winding upon and off said drum, a storage device receiving and holding the other end of the strap normally stationary and by which the amount of strap wound upon the power-drum is controlled, a footpiece engaging said strap connection and supported thereby, by which the strap is unwound from the power-drum to rotate it in one direction, and a drum-reversing device, whereby the duplicate sets of driving means can be positively connected to work respectively, so that the unwinding of the strap from the power-drum on one side will wind the strap upon the power-drum on the other side; or can be disconnected to work separately, so that each set is independent of the other at the will of the operator, substantially as described.

10. A drum-reversing device, comprising duplicate spring-drums having strap connections with duplicate sets of power-drums located upon each side of the part to be driven, said straps winding upon and off the respective drums on each side, duplicate spring-pressed clutches sliding upon splines or flutings upon a common shaft and having teeth adapted to engage similar teeth on said spring-drums, by means of which the said spring-drums and the power-drums are positively connected to work respectively or disconnected to work independently, and means for operating the said clutches with toggle-levers and handpieces conveniently located, substantially as described.

11. A clutch driving device, comprising a series of radial links pivoted at their inner ends to an axial shaft extending of a power-drum and at their outer ends carrying friction-blocks adapted to engage a suitable extension of the part to be driven, said friction-blocks being formed into engagement with said shaft extension upon the forward motion of said power-drum by the thrust of said links and blocks, by means of which the forward motion of the power-drum is imparted to the part to be driven, said links being pivoted intermediate of their ends to another shaft, by which the links are supported at equal distances apart and additional inertia obtained to force the said friction-blocks into engagement; the en-

gaging from said blocks being formed to be freed from the sleeve extension upon a cessation or reversing of said motion of said power-drum, substantially as described.

12. A storage device, comprising a storage-drum journaled within an appropriate casing conveniently located, a strap connection having one end secured to and winding upon said drum, a power-drum to which the other end of the strap is secured and upon which it winds, a hand engageable relative member or grip connected with said storage-drum to turn the same forward and backward to wind and unwind the strap thereon, and a ratchet-and-pawl locking arrangement, whereby the storage-drum is normally held stationary and the amount of strap wound upon the power-drum controlled and consequently the speed and power.

13. In a driving mechanism, the combination with duplicate clutch driving devices located on each side of and arranged to impart forward motion to the part to be driven, and pedals having independent driving connections each with the clutch driving device on its respective side, of duplicate spring-drums conveniently located and each operatively connected with the clutch driving device on its respective side for causing the return stroke, and means by which the said spring-drums and two sets of driving means may be united to work reciprocally or be disconnected to work separately and independently at the will of the operator, substantially as described.

14. In a driving mechanism, the combination, with a driving-wheel and a friction-wheel engaging the driving-wheel, of a power-drum having a clutch driving connection with said friction-wheel, a strap connection having one end secured to and winding upon and off said drum, means for causing and holding the other end of the strap normally stationary, a footpiece engaging said strap connection and supported thereby, by which the strap is unwound from said drum to rotate it in one direction, and means for reversing the motion of said drum to wind the strap thereon, substantially as described.

15. In a bicycle, the combination, with a hollow handle-bar and a drum mounted in a casing carried by the handle-bar, of a grip mounted to turn on the handle-bar, and provided with ratchet-teeth at its inner end, a spring-pressed roller sliding upon a spline or feather on the handle-bar, and provided with teeth to engage the teeth of the grip, and a flexible shafting in the hollow handle-bar connecting the outer end of the grip with the drum, substantially as described.

16. In a bicycle, the combination with the frame carrying the front wheel, a friction-wheel and the saddle, of levers in which the ends of the rear wheel is mounted, of the rear fork having its upper end pivoted to the upper part of the frame and the lower end of its fork to the rear ends of the said levers, and rear bracci pivoted to the forward ends of the said levers and to the rear lower portion of the frame, substantially as herein shown and described.

17. A variable-speed driving mechanism, comprising a power-drum, means for imparting the motion of the drum to the part to be driven, a strap having one end secured to the drum and winding upon the same, a spring-drum to which the other end of the strap is secured and upon which more or less of the strap can be wound, said spring-drum being normally stationary, a pedal connected with and supported by the strap and by which the said strap is unwound from the power-drum to rotate it in one direction and without affecting the movement of the spring-drum, and means for turning the power-drum in the opposite direction to wind the strap thereon, substantially as described.

18. A variable-speed driving mechanism, comprising a spring-power drum having a clutch mechanism, a strap having one end secured to the said drum and winding upon the same, a normally stationary spring-drum to which the other end of the strap is secured, means for rotating the spring-drum to wind a portion of the strap thereon, and a pedal connected with and supported by the strap between the said drums and by which the strap is unwound from the power-drum to rotate it in one direction and without affecting the movement of the spring-drum, substantially as described.

19. A variable-speed driving mechanism, comprising a spring-power drum having a clutch mechanism, a strap having one end secured to said drum and winding thereon, a normally stationary spring-drum to which the other end of the strap is secured, means for rotating the spring-drum to wind a portion of the strap thereon, and jointed links arranged between the said drums, the lowermost link carrying a pedal and a roller about which the strap from the power-drum to the spring-drum passes, substantially as described.

20. A variable-speed driving mechanism, comprising a spring-power drum having a clutch mechanism, a strap having one end secured to the said drum and winding thereon, a spring-drum to which the other end of the strap is secured and upon which a portion of the said strap can be wound to vary the amount of strap on the power-drum, and hollow jointed links through which the said strap passes, the lower link carrying a pedal and a roller about which the strap passes, substantially as described.

21. A variable-speed driving mechanism, comprising a spring-power drum having a clutch mechanism, a strap having one end secured to the drum and winding thereon, a spring-drum mounted upon the head of the frame and upon which a portion of the strap can be wound to vary the amount of strap on the winding-drum, means for operating the spring-drum from the grip of the handle-bar, and jointed hollow links through which the said strap passes, the lower link carrying a pedal, and a roller over which the strap passes, substantially as described.

22. A variable-speed driving mechanism for bicycles, comprising a friction-wheel engaging the rear wheel, a spring-drum having a clutch connection with the friction-wheel, a strap having one end secured to the drum and winding thereon and its other end secured to a support, and hollow jointed links pivoted to the frame and carrying a pedal at one end and a roller over which the said strap passes, substantially as described.

23. A variable-speed driving mechanism for bicycles, comprising a friction-wheel engaging the rear wheel, a spring-drum having a clutch connection with the friction-wheel, a strap having one end secured to the drum and winding thereon, a spring-drum to which the other end of the strap is secured, means for rotating the spring-drum to wind a portion of the strap thereon, and hollow jointed links pivoted to the frame, and through which the strap passes, the lower link carrying a pedal and a roller over which the strap passes, substantially as described.

24. A bicycle driving mechanism, comprising a set of tubular jointed links having guide-pulleys at their joints, and pivoted at one end of the set to the frame and carrying a pedal at the other end of the set, a flexible band or strap passing through the links and having one end secured to a support, and a pulley carrying the other end of the band and having a ratchet or clutch driving connection with the bicycle driving-wheel, substantially as described.

25. A bicycle driving mechanism, comprising a set of jointed links pivoted at one end of the set to the frame and carrying a pedal at the other end of the set, a pulley having a ratchet or clutch driving connection with the bicycle driving-wheel, a strap having one end secured to said pulley, and a storage-drum receiving the other end of the strap and adapted to be normally held stationary, the strap intermediate the pulley and drum being engaged by the pedal, substantially as described.

26. A bicycle driving mechanism, comprising a set of tubular jointed links having guide-pulleys at their joints and pivoted at one end of the set to the frame, a pedal carried by said links at the other end of the set, a pulley having a ratchet or clutch driving connection with the bicycle driving-wheel, a strap connected with said pulley to wind thereon, a storage-drum receiving the other end of the strap, and a strap intermediate the pulley and drum passing through the tubular links and about the pedal, substantially as described.

27. A bicycle, comprising a drum having a ratchet or clutch driving connection with a ground-wheel of the bicycle, a strap winding upon and off of said drum, means for winding the strap on said drum, a pedal or footpiece engaging said strap, a spring-drum located on the bicycle-head and receiving the other end of the strap, a hand-engageable relative member or grip connected with the spring-drum to turn it and a ratchet-and-pawl locking device for said drum for locking it stationary, substantially as described.

28. A bicycle, comprising a drum having a ratchet or clutch driving connection with a ground-wheel of the bicycle, a strap winding upon and off of said drum, means for winding the strap upon said drum, means with which the other end of the strap is secured and by which the amount of strap wound upon the drum is controlled, and a stirrup or pedal having a pulley or roller engaging the strap intermediate its ends, substantially as described.

29. A bicycle, having duplicate sets of driving means located one on each side thereof and each comprising a drum having a ratchet or clutch driving connection with a ground-wheel of the bicycle, a strap winding upon and off of said drum, means for causing and storing the other end of the strap, a stirrup having a pulley or roller engaging a loop of the strap, and means for connecting the two sets of driving devices, whereby the unwinding of the strap from one drum will wind the strap upon the other drum, substantially as described.

30. A bicycle, having duplicate sets of driving means located one upon each side thereof, and each comprising a drum having a ratchet or clutch driving connection with a ground-wheel of the bicycle, a strap winding upon and off of said drum, a pedal or footpiece engaging said strap, a spring-drum located on the bicycle-head, and receiving the other end of the strap, and a positive connection between the duplicate sets of driving mechanism, whereby the withdrawal of the strap from one driving-drum will wind it upon the other, substantially as described.

31. A bicycle, having duplicate sets of driving means located upon each side thereof, and each comprising a drum having a ratchet or clutch driving connection with a ground-wheel of the bicycle, a strap winding upon and off of said drum, a pedal or footpiece engaging said strap, and

storing-drum located on the bicycle-head and receiving the other end of the strap, and a connection between the two sets of driving mechanisms containing a clutch by which they may be positively connected to work reciprocally or be disconnected to work separately, substantially as described.

32. In a bicycle, the combination with the frame, a spring-pulley, and means for operating the rear or drive wheel therefrom, of a strap having one end secured to the said pulley, a second pulley on the frame near the head thereof, and to which the other end of the strap is secured, means for operating the second pulley to wind the strap thereon, a pedal, and hollow links connecting the pedal with the frame and provided with pulleys, over which the strap in its passage through the said links to the second pulley passes, substantially as described.

33. In a bicycle, the combination with the rear wheel, and a friction-wheel engaging the rear wheel, of a spring-pulley, a clutch connection between the pulley and friction-wheel, a strap having one end secured to the pulley, a second pulley to which the other end of the strap is secured, said pulley being normally held stationary, means for turning the second pulley to wind a portion of the strap thereon, and a pedal carried by the strap for reciprocating it to turn the spring-pulley, substantially as described.

34. In a bicycle, the combination with the frame, the rear wheel, and a friction-wheel engaging the rear wheel, of a spring-pulley, a clutch connection between the pulley and friction-wheel, a second pulley to which the other end of the strap is secured, means for rotating the second pulley to wind the strap thereon, a pedal, and hollow links connecting the pedal with the frame and provided with pulleys, the said strap passing from the spring-pulley through the links and the forward brace of the frame to the second pulley, substantially as described.

35. In a bicycle driving mechanism, the combination with a driving-wheel, and a driving-pulley, of a series of links pivoted to the pulley, friction-blocks at the outer ends of the links and adapted to engage the hub of the driving-wheel, and means for supporting the links and blocks at regular distances apart, substantially as described.

36. In a bicycle driving mechanism, the combination with a driving-wheel having an axial sleeve and a flange on its hub, and a driving-pulley mounted on the sleeve of the driving-wheel, of a series of radial links pivoted at their inner ends to the pulley, friction-blocks secured to the outer ends of the links and adapted to engage the inner surface of the flange of the driving-wheel, and a ring to which the outer ends of the arms and the blocks are pivoted, substantially as described.

702,805. DENTAL APPLIANCE. EMERY E. LEBLANC, Birmingham, Tenn. Filed Oct. 21, 1901. Serial No. 73,374. (No model.)

Claim.—1. A dental appliance, comprising arch-bars one arranged above the other, spring-yielding hinge members with which said arch-bars are adjustably connected, and braces extending between the portions of the hinges and the arch-bars, substantially as specified.

2. A dental appliance, comprising arch-bars one arranged above the other, elbow members in which the side portions of the arch-bars are arranged to slide, spring-yielding hinges having adjustable connection with the upwardly-disposed surfaces of the elbows, spring-yielding brace-connections between the outer members of the hinges and the lower arch-bar, and adjustable brace connections between the inner members of the hinges and the upper arch-bar, substantially as specified.

3. In a dental appliance, upper and lower arch-bars, elbow members in the horizontal portions of which the side portions of the upper arch-bar are inserted to slide, elbow members in the horizontal portions of which the side of the lower arch-bar are inserted to slide, adjustable collars on the side portions of the lower arch-bar, springs arranged between said collars and the ends of the elbows, spring-yielding hinges, stems extending from the outer surfaces of the hinges into the upwardly-disposed surfaces of the elbows connecting with the lower arch-bar, means for holding said stems as adjusted, stems extending from the inner members of the hinges and adjustable in the upwardly-disposed members of the elbows connecting with the upper arch-bar, means for holding said stems as adjusted, braces pivotally connected at one end to the inner members of the hinges and at the other end to studs on the upper side of the upper arch-bar, and braces pivotally connected at the upper ends to the outer members of the hinges and at the lower ends to the lower arch-bar, substantially as specified.

4. A dental appliance, comprising upper and lower arch-bars having spring-yielding and sliding connection, substantially as specified.

5. A dental appliance, comprising upper and lower arch-bars pivotally connected together, the pivotal connection being above the plane of the bars.

702,806. SASH-FASTENER. RICHARD B. LOGAN, St. Louis, Mo. Filed Oct. 20, 1901. Serial No. 66,482. (No model.)

Claim.—1. In a sash-fastener, the combination of a slide-bolt adapted to be mounted on the lower sash of a window for engagement with the window-frame, of an auxiliary slide-bolt parallel to and rigid with said slide-bolt, and keepers carried by the upper sash of the window, said auxiliary bolt adapted to engage said keepers.

2. In a sash-fastener, the combination of a main slide-bolt carried by the lower sash of a window and adapted to engage keepers in the window-frame, of a parting-strip and keepers carried by said parting-strip, of keepers carried by the upper sash of the window and an auxiliary bolt parallel to and rigid with the main slide-bolt and adapted to pass through the keepers carried by the upper sash to engage the keepers in the parting-strip.

3. In a sash-fastener, in combination with the lower sash of a window, a bar-plate carried by said sash, a slide-bolt carried by said plate and adapted to engage keepers in the window-frame, of an auxiliary slide-bolt parallel to and rigid with said slide-bolt and adapted to engage keepers carried by the parting-strip and the upper sash of the window, of a recess in said bar-plate, said auxiliary bolt provided with a tapered end, and a retaining-screw carried by said auxiliary bolt and adapted to engage the recess and to hold the bolt against movement.

4. In a sash-fastener, the combination with the lower sash of a window, of a bar-plate carried by said sash, of a slide-bolt carried by said bar-plate and adapted to engage keepers in the window-frame, of a second bar-plate, said bolt also sliding therein, of a recess in said bar-plate, of a key adapted to fit in said recess, a recess in said bolt, said key also engaging the recess in said bolt, whereby movement of the bolt is stopped and an auxiliary bolt parallel to and rigid with said slide-bolt and adapted to engage suitable keepers in the parting-strip and upper sash of the window.

702,807. PACKAGES FOR FRAGILE ARTICLES. EDWIN C. LOGAN, Erie, Pa. Filed Aug. 15, 1901. Serial No. 71,857. (No model.)

Claim.—1. In a package for fragile articles of concave-convex form, means for holding a series of articles one nested in another and for separately supporting them, comprising a series of removable ribs formed with perforated plates and separating-strips, the strips being of sufficient thickness to support the plates a distance apart to form a space between the plates to receive the edges of the articles with the upper and lower opposing surfaces of the edges in supporting engagement with the opposing surfaces of the separated plates and the perforations being of such size as to permit the corners of the articles to project into the next adjacent article.

2. In a package for fragile articles, means for holding a series of articles, one nested in another and for separately supporting and registering them, comprising a series of removable ribs formed with perforated plates and separating-strips, the strips being of sufficient thickness to support the plates a distance apart to form a space to receive the edges of the articles with the upper and lower surfaces of the edges in supporting engagement with the opposing surfaces of the separated plates, and the perforations being of a size to permit the corners of the articles to project into the next adjacent article.

3. A rib for packages for fragile articles comprising a plate and sepa-

rating-strips arranged at intervals on both sides of said plate; the intervals being proportioned to the size of the article, the strips on one side being placed in a direction opposite to those on the opposite side; and means for securing the strips on the opposite side of the plate together.

4. A till for packages for fragile articles comprising a plate provided with rows of perforations and separating-strips secured to the plate and arranged in opposite directions between the rows.

5. A till for packages for fragile articles comprising a plate provided with rows of perforations; and separating-strips secured to the plate arranged in opposite directions between the rows, said strips being secured together at the points of crossing.

4. A sill for packages for fragile articles comprising a plate provided with rows of perforations; and separating-strips arranged between the rows of perforations on both sides of the plate, these on one side being placed in a direction opposite those on the opposite side; and means for securing the strips on the opposite sides of the plate together.

7. A fill for packages for fragile articles comprising a plate provided with rows of perforations and expanding-strips arranged between the rows of perforations on both sides of the plates, these on one side being placed in a direction opposite to those in the opposite side; and means at the points of crossing for securing the strips to the plates and to each other.

8. A fill for packages for fragile articles comprising a plate provided with rows of perforations; and separating-strips arranged between each row of perforations on both sides of the plate, these on one side being placed in a direction opposite those on the opposite side; and means for securing the strips together.

3. In a package for fragile articles the combination of a series of three thin compressing plates, two of which have rows of perforations of equal size arranged in register; mid plates being stiffened by strips secured to the plate and extending in opposite directions between the rows of perforations, mid strips being arranged to support the plates an equal distance apart.

10. In a package for fragile articles the combination of a series of stiff supporting plates with perforations of equal size arranged in regular, said plates being stiffened by strips secured to the plate and extending in opposite directions between the rows of perforations, said strips being arranged to support the plates at equal distance apart.

11. A package for targets of cone-cone-cone form, having the rim, *a*, crown, *c*, and shoulder, *d*, the exterior diameter of the shoulder, *d*, being less than the interior diameter of the rim; *a* comprising the plate, *b*, having the perforations, *b'*, approximately of the size of the shoulder, *d*, and means for holding the perforations in register and for supporting the plates a sufficient distance apart to receive the rim, *a*, and engage the upper and lower surfaces of the said rim.

12. A passage for targets of cone-cone form, having the radius r , the crown, ϕ , a shoulder, δ , the exterior diameter of the shoulder α being less than the interior diameter of the rim α comprising the plates α , and having the perforation, β ; means for holding the perforation in register; separating-strips secured to the plates, said strips being of a thickness to separate the plates a sufficient distance to receive the rim α , between the plates and engage the upper and lower surfaces of the said rim

13. A passage for targets of concrete-concrete form, and having a rim, *a*, crown, *b*, shoulder, *c*, comprising the plate, *d*, having the perforations, *e*, the strips, *f*, arranged in one direction and the strip, *g*, in the opposite direction; means for securing the strips together and to the plate at the points of crossing, the perforations, *h*, being of approximately the size of the shoulder, *c*, and the combined thickness of the strip, *f*, is approximately the height of the rim, *a*.

14. A passage for targets of *concreto-canvas* form, having the parts *a*, *groove*, *b*, *shoulder*, *c*, comprising the plate, *d*, having rows of perforations, *e*, the strips, *f*, arranged on one side of the plate, between the rows, the strips, *g*, arranged on an opposite side of the plate between the rows; means for securing the strips together and to the plate at the points of securing; means for holding the plate in register, and perforations, *h*, being approximately the size of the shoulder, *b*, and the combined thickness of the strips, *f* and *g*, being approximately the height of the rim, *a*.

15. In a package for fragile articles, the combination of the box having the projecting edge pieces, *a*, and supporting-strips, *a'*, away from the edge pieces; and tiles arranged to slip into the box in contact with the supporting-strips, *a'*.

16. In a package for fragile articles, the combination of the box in-
 cluding projecting edge pieces, *a*, and supporting-strips, *a'*, away from
 edge pieces; tiles arranged to slip into the box in contact with the sup-
 porting-strips, *a'*; and tiles provided with expanding-strips at inter-
 vals, *b*, and on both sides of the tiles, there on one side being arranged in oppo-
 sition to the tiles on the other, the supporting-strips, *a'*, being arranged
 to support the tiles at points opposite expanding-strips other than
 other expanding-strips.

702,808. ELECTRIC PROGRAM-CLOCK. JAMES O. LYMAN, Watertown, Conn. Filed Aug. 28, 1901. Serial No. 72,967. (No model.)

Claim.—1. In a program-signaling device, the combination with a plate, a shaft projecting therefrom, and means for rotating said shaft, of a wheel mounted upon said shaft, a program-tape carried by said wheel and driven thereby, said tape being provided with a series of openings arranged at spaced intervals in accordance with the number of signals to be transmitted, a guiding lever pivoted upon said plate and normally riding upon the program-tape, a stationary post also carried by said plate and provided upon one of its faces with a contact-point over which said tape passes, said lever, post and plate forming part of an electric circuit including a signaling mechanism, a program-wheel arranged adjacent to the driven wheel and provided with detectable pins arranged thereon in accordance with the periods of time during which it is desired to prevent the transmission of signals, said pins contacting with said lever to hold the latter out of contact with the program-tape, and means for rotating said program-wheel.

2. In a program-signaling device, the combination with a plate, a shaft projecting therethrough, and means for rotating said shaft, of a wheel mounted upon said shaft, a program-tape carried by said wheel and driven thereby, said tape being provided with a series of openings arranged at spaced intervals in accordance with the number of signals to be transmitted, a series of blade-wheels arranged in proximity to the driven wheel and over which said tape passes, one of said wheels being bodily movable and adapted to gravitate for tensioning said tape, a gear-wheel bolted to a crank lever pivoted upon said plate and normally riding upon the program-tape, a stationary pin also carried by said plate and provided upon one of its flues with a contact-piece over which said tape passes, said lever, pin and plate forming part of an electric circuit including a signaling mechanism, a program-wheel arranged adjacent to the driven wheel and provided with detachable pins arranged therein in accordance with the periods of time during which it is desired to prevent the transmission of signals, said pins contacting with said lever to hold the latter out of contact with the contact-piece, and means for rotating said program-wheel.

3. In a program-signaling device, the combination of a main plate, shaft projecting therethrough, and means for rotating said shaft, of a wheel mounted upon said shaft, a program-tape carried by said wheel and driven thereby, said tape being provided with a series of openings arranged at spaced intervals in accordance with the number of signals to be transmitted, a series of filter-wheels arranged in proximity to the driven wheel and over which said tape passes, one of said wheels being bodily movable and adapted to pivotally rotate the remaining said wheels, a camming lever pivoted upon said plate and normally riding upon the program-tape, a delivery post also carried by said plate and provided upon one of its flaps with a contact-plate over which said tape passes, said lever, post and plate forming part of an electric circuit including a driving wheel and provided with detachable pins arranged thereon in accordance with the period of time during which it is desired to prevent the transmission of signals, said pins contacting with said lever to hold the latter

JUNE 17, 1902.

U. S. PATENT OFFICE.

3733

out of contact with the program-tape, a lever for operating the program-wheel, and a cam carried by the shaft of the driven wheel for operating said lever.

702,809. LOCOMOTIVE VALVE-GEAR. HARRY MAXWELL, West
Oakland, Cal. Filed Aug. 14, 1901. Serial No. 71,200. (No model.)

Claim.—1. A locomotive-engine having steam admission and exhaust valves, a valve-gear for actuating said valves and controlled by the engine, and a reversing-valve arranged between the admission and exhaust valves and controlling the admission of the steam to and the exhaust of said steam from said admission and exhaust valves, the reversing-valve being under the control of the engineer; as set forth.

2. An engine valve-gear, comprising admission and exhaust valves, a valve-gear controlled by the engine and connected with said admission and exhaust valves, to periodically rock the same, and a reversing-valve under the control of the engineer and having its valve-rod connected with the inlet-chamber and the exhaust-chamber, said reversing-valve being between the admission and exhaust valves and arranged to connect the inlet-chamber with both the admission and exhaust valves, and to connect the latter with said exhaust-chamber, as set forth.

3. In an engine valve-gear, admission and exhaust valves at opposite ends of the cylinder, a valve-gear controlled by the engine for admitting said valve, and a rocking covering-valve arranged between the admission and exhaust valves and having its casing connected with the inlet and exhaust chambers, said valve being under the control of the engine and provided with parts for connecting the inlet-chamber with both the inlet and exhaust valves, and the exhaust-valve with the said exhaust chamber, as set forth.

4. In an engine valve-gear, admission and exhaust valves at opposite ends of the cylinder, a valve-gear controlled by the engine for opening said valves, a rocking reversing-valve arranged between the admission and exhaust valves and having its moving connected with the intake and exhaust chambers, said valve being under the control of the engine and provided in its periphery with oppositely-arranged sets of ports for connecting the intake-chamber with both the admission and exhaust valves and the exhaust-valve with the exhaust-chamber, as set forth.

5. In an engine valve-gear, the combination with a cylinder, and steam-chest thereon, said chest having ports leading to the opposite end of the cylinder, of admission and exhaust valve casings in the chest and each provided with a pair of oppositely-arranged ports, a valve in each casing and provided with a port leading therethrough, means for opening the said valves from the engine, a reversing-valve casing in the side chest between the admission and exhaust valves, and provided with a plurality of ports, two of which are in communication with the inlet-chamber, two in communication with the exhaust-chamber, and two in communication with ports leading to the ports of each of the admission and exhaust valve casings, a rocking reversing-valve in said casing and provided in its periphery with oppositely-arranged sets of ports, and means for operating the reversing-valve, as set forth.

702,810. VALVE STOPPER FOR RECEPTACLE, &c. SAMUEL
HUBBARD, New York, N. Y., assignor of one-half to Joseph Harnettstein,
New York, N. Y. Filed Oct. 17, 1904. Serial No. 73,974. (No model.)

Claim.—A valve-closer for receptacles adapted to contain volatile and effervescent liquids comprising a main body or shell having an air chamber within, an inlet tube connected with said chamber, an adjustable outlet tube also connected with the chamber and having a portion thereof formed into a valve or closure for controlling the inlet-passage, a

adjustable perforated thumb-screw secured to said body enclosing the outlet-tube and for adjusting the same to control the inlet-passage, washers impervious to and insulated by the gases and liquid surrounding the outlet-tube and located in the air-chamber between the thumb-screw and the closure portion of the outlet-tube, and a washer in the lower end of the body surrounding the inlet-passage whereby ingress of the emanations of the various parts with the liquid and gases is prevented, and a tubular air having auxiliary bore connected with the outlet-tube.

702,811. SANITARY RECEPTACLE AND OVERPOOL. JOHN F. MCCOY and THOMAS N. CHENEY, New Orleans, La. Filed Sept. 22, 1900.
Serial No. 81,821. (No model.)

Claim.—1. The combination with a venturi receptacle and a pipe leading thereon, of a pump consisting of an inner chamber and an outer chamber, the walls of said chamber being adapted for the discharge of liquid through the same, a pipe leading from the receptacle into the inner chamber, and a siphon leading from said inner chamber into the outer chamber, substantially as specified.

2. The combination with a sanitary receptacle and a pipe leading therein, of a compound consisting of an inner chamber and an outer chamber, the walls of said chamber being adapted for the discharge of liquid through the same, a pipe leading from the receptacle into the inner chamber, a siphon leading from said inner chamber into the outer chamber, and a pipe leading from the outer chamber into the ground, substantially as specified.

3. The combination with a practically air and gas tight receptacle and a valved pipe leading therein, of a compost, having a porous wall, a discharge-pipe leading from the receptacle into said compost, and a pipe of porous material leading from said compost into the ground, substantially as modified.

702,812. BRAKE MECHANISM. PAUL J. McCULLOUGH, St. Louis.
Mo. Filed May 14, 1904. Serial No. 52,204. (No model.)

Claim.—1. A brake-staff, a guide therefor, a ratchet-wheel on the staff, and a holding-dog for engaging with the ratchet-wheel, the said dog having swinging connection at its upper end with the staff and a lower and bearing at one side of the staff, substantially as specified.

2. A turn-staff, a guide therefor arranged on the end of a cap-bolt passing horizontally through said guide and through the end of the car, a ratchet-wheel on the staff, and a holding-dog consisting of a member mounted to swing at its upper end on the staff and having a bearing at its lower end in a guide at one side of the staff, the said dog having a crank portion for engaging with the ratchet-wheel, substantially as specified.

2. A brake-staff, a guide in which said brake-staff is mounted to turn, a ratchet-wheel on the staff, and a holding-dog for engaging with the ratchet-wheel, the said holding-dog having a laterally-extended collar at its upper end through which the staff passes and the said dog having

bearing at its lower end and at one side of the shaft, said dog having a crank portion for engaging with the ratchet-wheel and a return portion or shoulder for engaging upon the upper side of the wheel, substantially as specified.

709,818. SUGAR-CANE CONVEYER. CHARLES E. McHALLY, Waipahu, Territory of Hawaii. Filed Mar. 20, 1901. Serial No. 68,980. (No model.)

Claim.—1. A cane-loading machine comprising a frame provided with a driving ground-wheel on each side, two motors one at each side of the center of the frame, a clutch-controlled operating mechanism between each motor and a driving-wheel, a conveyor mounted in the frame, and a clutch-controlled operating mechanism between each motor and the conveyor, as set forth.

2. A cane-loading machine, comprising a frame provided with a driving ground-wheel on each side, two motors, one at each side of the center of the frame, a clutch-controlled mechanism between each motor and a driving-wheel, a conveyor extending transversely of the frame, a clutch-controlled operating mechanism between each motor and the conveyor, and an elevator at one side of the frame and driven from the conveyor, as set forth.

3. A cane-loading machine comprising a supporting-frame, a pair of wheels at each side, one in front of the other of the frame, two motors, one at each side of the center of the frame, a clutch-controlled operating mechanism between each motor and one of the wheels of a pair, a conveyor mounted in the frame and extending between the wheels of each pair, and a clutch-controlled operating mechanism between each motor and the conveyor, as set forth.

4. A cane-loading machine, comprising a supporting-frame, a pair of wheels at each side of the frame one in front of the other, two motors, one at each side of the center of the frame, a clutch-controlled operating mechanism between each motor and one of the wheels of a pair, a con-

veyor mounted in the frame and extending between the wheels of each pair, a clutch-controlled operating mechanism between each motor and the conveyor, an elevator adjustably connected with one side of the supporting-frame, and means for operating the elevator from the conveyor, as set forth.

5. In a cane-loading machine, the combination with a wheel-supported frame, of a boiler on the frame, independent steam-engines on the frame one on each side of the boiler, and connected therewith, a conveyor mounted in the frame, and an operating mechanism between each motor and one of the supporting-wheels and the conveyor, as set forth.

6. In a cane-loading machine, the combination with a frame provided with a driving ground-wheel on each side, and a transversely-extending conveyor mounted in the frame, of two independent motors, shafts each having a clutch-controlled connection with one of the driving-wheels, gearing between each shaft and the conveyor, and clutch-controlled gearing between each shaft and one of the motors, as set forth.

709,814. OIL-FILTER. THOMAS HENRY, Liège, Belgium. Filed Dec. 2, 1901. Serial No. 64,800. (No model.)

Claim.—1. In an oil-filter, the combination of a vessel adapted to contain hot water, an orifice near the top end of said vessel, a cover to close said vessel, a tube fixed to said cover and reaching down to about the bottom of the vessel, the lower end of said tube being formed with apertures, and a series of superposed filtering-sheets of successively finer mesh fixed around said tube and fitting against the vessel, all for the purpose and substantially as set forth.

2. In an oil-filter, the combination of a vessel adapted to contain hot water, an orifice near the top end of said vessel, a cover to close said vessel, a tube fixed to said cover and reaching down to about the bottom of the vessel, the lower end of said tube being formed with apertures, a series of superposed filtering-sheets of successively finer mesh fixed around said tube and fitting against the vessel, a reservoir mounted on the vessel and in communication by a channel with the tube, a valve, valve-spindle, regulating-screw, and a filtering-sheet near the bottom of said reservoir, all for the purpose and substantially as set forth.

3. In an oil-filter, the combination of a vessel adapted to contain hot water, an orifice near the top end of said vessel, a cover to close said vessel, a tube fixed to said cover and reaching down to about the bottom of the vessel, the lower end of said tube being formed with apertures, a series of superposed filtering-sheets of successively finer mesh fixed around said tube and fitting against the vessel, a reservoir mounted on the vessel and in communication by a channel with the tube, a valve, valve-spindle, regulating-screw, a filtering-sheet near the bottom of said reservoir, a receptacle on the side of the vessel, a filtering-sheet in said receptacle, and draw-off cocks in and on, all for the purpose and substantially as set forth.

709,815. OIL-FILTER. LAM C. FRANK, New York, N. Y., assignor to Richard M. Fisher and Harry A. Fisher, New York, N. Y., and Hildah Andersen, New Haven, Conn. Filed Sept. 6, 1901. Serial No. 74,660. (No model.)

Claim.—1. An oil-filter comprising a rotary part, a scraper adjustably transversely thereof, and means for holding the scraper as adjusted, substantially as specified.

2. An oil-filter comprising an oil-receptacle, a part mounted to rotate in said receptacle, an apron partially surrounding said rotary part

and adapted to have its lower end extended into oil, and a scraper bearing on the rotary part at the outlet end of the apron, substantially as specified.

3. An oil-filter comprising an oil-receptacle, a cylinder mounted to rotate therein, an apron partially surrounding the cylinder, and a spring-pressed finger bearing upon the cylinder at the outlet of the apron, substantially as specified.

4. An oil-filter comprising an oil-receptacle, a cylinder mounted to rotate therein, an apron partially surrounding the cylinder, a spring-pressed scraper bearing upon the cylinder, and means for adjusting the scraper, substantially as specified.

5. An oil-filter comprising an oil-receptacle, an oil-carrying device mounted to rotate in the receptacle, an apron partially surrounding said oil-carrying device, a scraper bearing upon the oil-carrying device, and a funnel into which said scraper is designed to discharge oil, substantially as specified.

6. An oil-filter comprising a receptacle for oil, a cylinder mounted to rotate in the receptacle and having a plurality of oil-carrying surfaces, aprons partially surrounding the oil-carrying surfaces, scrapers bearing upon said oil-carrying surfaces, and means for simultaneously adjusting the several scrapers, substantially as specified.

7. An oil-filter comprising a receptacle for oil, a rotary part in said receptacle and having a plurality of oil-carrying surfaces, aprons partially surrounding said surfaces, spring-pressed scrapers bearing upon said surfaces, arms extended upward from the scrapers, and a screw-rod with which teeth upon said arms are adapted to engage.

709,816. GARMENT-SUPPORTER. EDWARD E. FARMER, West Somerville, Mass., assignor of one-half to Mary Anthony, Whitefield, Mass. Filed Apr. 2, 1902. Serial No. 101,000. (No model.)

Claim.—1. A garment-supporter, having a plate terminating at one end in a hook and having its other end split, and a pin slidable on one of the split end members and having an angular arm engaged by another split end member, as set forth.

2. A garment-supporter, comprising a plate terminating at one end in a hook and having its other end split to form two members of which one is formed into an eye extending on the back of the plate, and a pin extending along substantially the middle of said plate at the back thereof, the said pin having a pivot, connected by a bent portion with the shank of the pin, the pivot engaging the said eye and the said pivot terminating in an angular arm pressed on by the other spring member of the split end of the plate, as set forth.

3. A garment-supporter comprising a plate terminating at one end in a hook and having its other end split, and a pin slidable upon the plate near said split end and having an angular arm engaged by one of the split members.

709,817. WEAVING-MACHINE TRUCK. ALFRED PALMER, Columbus, Ohio, assignor to the Feltner Manufacturing Company, Columbus, Ohio, a Corporation of Ohio. Filed Nov. 21, 1900. Serial No. 57,990. (No model.)

Claim.—1. In a combined coal cutting and transporting mechanism, the combination of the truck, the supporting-wheel, the power-shafting, means connecting the power-shafting to the supporting-wheel, the worm-gearing, the clutch element, and the separable cutting apparatus, having an electric motor and counterpart clutch element, said cutting apparatus

being adapted to be drawn to such position on the transporting mechanism as to have the two clutch elements mutually engage, substantially as set forth.

2. In a combined coal cutting and transporting mechanism, the combination of the truck, the supporting-wheel, the transverse shaft, the sprocket-gearing connecting the transverse shaft with the supporting-wheel, the longitudinally-arranged shaft, the worm-gearing connecting the longitudinal and the transverse shafts, the clutch element on the longitudinal shaft, and the cutting apparatus adapted to be drawn onto the truck, and having a clutch element counterpart to, and adapted to be engaged with the abovementioned clutch element, substantially as set forth.

3. In a transporting-truck for transporting mining-machines, the combination of the platform having a guideway for the mining-machine, the supporting-wheel, the endless chain mounted longitudinally of the platform, and adapted to move a mining-machine with an abovementioned power device for actuating said chain, substantially as set forth.

4. In a wheeled truck for transporting mining-machines, the combination of the platform, the supporting-wheel, the endless chain mounted longitudinally of the platform and adapted to detachably engage with the mining-machine and move it longitudinally, and means for imparting power to the chain substantially as set forth.

5. In an apparatus comprising a wheeled truck and a separable mechanism adapted to be transported by the truck and provided with a motor and a rotary power-transmitting element actuated by the motor and otherwise having a fixed position, the combination of the truck-frame, the wheels thereon, the power-transmitting device connected with the wheels, the initial power-receiving element actuating said power-transmitting device having a fixed position and adapted to mesh or be engaged with the power-transmitting element on the separable mechanism when the latter is moved bodily onto the truck, substantially as set forth.

6. In an apparatus comprising a wheeled truck and a separable mechanism adapted to be transported by the truck and provided with a motor, the combination of the truck-frame, the wheels thereon, the power-transmitting device connected with the wheels, and a shaft longitudinal of the truck, said separable mechanism having also a longitudinal shaft adapted to be actuated by its power device, and means for connecting said longitudinal shafts.

709,818. POLYMER. NEW W. PALMER, St. Louis, Mo., assignor to Leighton & Howard Steel Company, St. Louis, Mo., a Corporation. Filed Mar. 2, 1902. Serial No. 57,817. (No model.)

Claim.—1. A belt consisting of an upper and lower chord, and a connecting-web, said upper chord and the upper portion of the connecting-web being formed with a king-bolt opening, and said web having a

horizontal opening at the base of the king-bolt opening, substantially as set forth.

2. A bolster having an upper and lower chord, a connecting-web, a part formed integral with the upper chord and the upper part of said web, and which is provided with a king-bolt opening and a horizontal beam formed integral with said web and through which an aperture is formed, substantially as described.

702,819. CAR-ROUTE INDICATOR. MAXIM G. PARENTIAN, Springfield, Mass. Filed Dec. 12, 1900. Serial No. 20,040. (No model.)

Claim.—1. In a car-route indicator, the combination with a reversible polygonal sign, having a plurality of indicator-faces and one blank face, of a lantern in position to illuminate all the faces of the sign, and a series of movable transparent slides for the lantern, which slides carry indices which may be thrown on the blank face of the sign, substantially as described.

2. In a car-route indicator and in combination, a reversible polygonal sign having one blank face, a lantern in position to illuminate the face of the sign, and a series of transparent slides one being blank and all mounted end to end and constituting approximately a ring arranged to rotate about the light within the lantern, so as to pass the light from the lantern through any one of the slides and exhibit the same on the sign.

3. The combination with a reversible sign having a blank face acting as a screen, of a lantern arranged at an angle to said screen, and a transparent slide connected to the lantern and having letters on its face differing in size in determined relation to the screen, so that the letters on the screen may appear of uniform size, substantially as described.

4. In a car-route indicator, the combination of a lantern having a plurality of movable transparent slides, with a movable sign-carrier having a plurality of sign-faces, any one of which faces can be turned into the illuminating-field of the lantern, and serve as a screen therefor.

702,820. MASSAGE-MACHINE. CHARLES FRANKLIN and JOHN SHIFFER, Chicago, Ill. Filed Nov. 26, 1901. Serial No. 23,460. (No model.)

Claim.—1. A massage-machine, comprising a frame, a massage member, a longitudinal handle mounted upon said frame, and mechanism connected with said frame and said massage member, and free to rotate said member in a direction substantially parallel to the general direction of said handle.

2. A massage-machine, comprising a frame provided with a longitudinal head, a handle loosely connected with said frame and disposed at right angles to said head, a revolvable member extending through said handle and provided with a cam, the axis of said cam being at right an-

gles to the general direction of said head and parallel with said handle, a rocking lever pivotally mounted in said head and provided with a member engaging said cam, and means for securing a massage member to said lever.

3. A massage-machine, comprising a frame, a revolvable member mounted thereon and provided with a spiral cam, a lever provided with a yoke embracing said cam, a beam mounted upon said yoke and engaging said cam, means for securing a massage member to said lever, and means for actuating said revolvable member.

4. A massage-machine, comprising a hollow frame, a rocking lever journaled within the same and provided with a receptacle for the purpose of holding a lubricant, a cam for actuating said lever, and an absorbent member engaging said receptacle and said cam for the purpose of lubricating said cam, means for securing a massage member to said lever, and mechanism for actuating said cam.

5. A massage-machine, comprising a hollow frame having two longitudinal members forming an angle with each other, a longitudinal handle mounted upon one of said members, a longitudinal rocking lever journaled in the other member and normally disposed in a general direction parallel therewith, said lever being free to rock in a plane parallel with the axis of said handle, fastenings for mounting a massage member to said lever, and means for actuating said lever, the arrangement being such that said massage member is free to move in a direction substantially parallel with the general direction of said handle.

6. A massage-machine, comprising a hollow frame, a cam mounted thereon, means for actuating said cam, a rocking member provided with a beam for engaging said cam, means for adjusting said beam relatively to said cam for the purpose of regulating the stroke of said rocking member, and means for securing a massage member to said lever.

7. A massage-machine, comprising a hollow frame, a cam revolvably mounted thereon, means for actuating said cam, a rocking member provided with a beam for engaging said cam, a guide for preventing said rocking member from moving in a direction other than its normal direction of rocking movement, and means for securing a massage member to said rocking member.

702,821. METHOD OF MAKING SHUNT-BAKES. GLEN H. FORTMAN, Westboro, Pa. Filed Feb. 27, 1902. Serial No. 25,000. (No model.)

Claim.—The art of manufacturing shunt-bakes from single blanks or plates of sheet metal of a substantially oblong shape, consisting in cutting the longitudinal edges of the blank transversely at opposite points, folding the opposite longitudinal edges of the plate over upon the main part of the plate and forging said folded parts and main part into a homogeneous shank portion and at the same time lengthening said shank portion, then bending it at approximately right angles to the main part of the blank at a distance therefrom and splitting in two and to form a handle-socket, longitudinally slitting the main part of the plate from the opposite end thereof to near the shank and then forging the members thus formed into tines and a head portion, as set forth.

702,822. DEVICE FOR UNROLLING CLOTH OR OTHER FABRIC. HARRY L. BOWEN, New York, N. Y. Filed Jan. 20, 1902. Serial No. 21,000. (No model.)

Claim.—1. In a device for unrolling cloth or other fabric, a base, a platform having rotary motion on said base, ball-bearings interposed between the base and platform, a brake carried by the base and engaging with the platform, and a sustaining member for the belt or roll of cloth, comprising a bottom plate and upright, and means carried by said plate for locking engagement with the platform, as described.

2. In a device for unrolling cloth or other fabric, the combination, with a base having a central opening and a downwardly-extending collar surrounding the opening, a platform provided with a central opening and a sleeve surrounding the opening and extending downward from the platform loosely through the collar of the base, the lower end of which sleeve is provided with a nut, ball-bearings located between the opening from of the platform and the base, a curve-brake carried by the base and engaging with the under face of the platform, and a socket formed at the upper portion of the platform, consisting of a collar having recesses in its upper edge, of a sustaining member for the belt or roll, consisting of an upright adapted to be passed through the central portion of a belt or roll, a bottom plate upon which the lower portion of the belt or roll is adapted to rest, a pin extending from the base and adapted to be loosely passed through the sleeve of the platform, and studs extending from the plate at opposite sides of the pin, adapted to enter the recesses in the socket on the platform when the pin of the said sustaining member is entered in the sleeve of the platform, as set forth.

702,823. BOAT. GEORGE SCHAEFER, Superior, Minn. Filed Oct. 12, 1901. Serial No. 24,712. (No model.)

Claim.—A marine vessel, having in the bottom of its hull a downwardly-opening longitudinally-extending groove, a downwardly-extending shield located at and forming a continuation of the forefoot of the hull and in line with the groove in the hull, tubular trunks projecting up from the bottom of the hull and lying immediately over the groove, a centerboard capable of lying longitudinally in the groove in the bottom of the hull with its front and just aft of the shield, center posts attached to the centerboard and projecting up through the trunks, and means working with one post whereby to raise or lower the board, the board being capable of dropping below the bottom of the hull, for the purpose specified.

702,824. SAFETY APPLIANCE FOR HANDING AND FEEDING MOLDS. HERBERT SCHWABER, Kansas, U. S. Filed Feb. 1, 1902. Serial No. 20,120. (No model.)

Claim.—1. The combination, with a sanding-machine having a platform and means for automatically delivering the molded molds thereon, of a pusher movable along the platform to shift the molds thereon, and means actuated by the mold when shifted upon the platform to prevent the engagement of the pusher with a succeeding mold until the preceding mold is removed.

2. The combination, with a sanding-machine having a platform and means for automatically delivering the molded molds thereon, of a pusher for shifting the molds upon the platform, a pusher guide or track for containing the pusher in an operative position adjacent to the platform, a safety-truck adjacent to the pusher-guide, the safety-truck having a removable section at its rear end as set forth, and means actuated by the mold when shifted upon the platform for holding the track closed by such section and preventing the access of the pusher to a succeeding mold upon the platform, until the preceding mold is wholly removed from the platform.

3. The combination, with a sanding-machine having a platform and means for automatically delivering the molded molds thereon, of a pusher for shifting the molds upon the platform, a pusher guide or track for containing the pusher in an operative position adjacent to the platform, a safety-truck adjacent to the pusher-guide, the safety-truck having a removable section at its rear end as set forth, a lever or toe projected in the path of the mold when shifted and connections from such lever to the removable track-section, to hold the track closed until the shifted mold is wholly removed.

4. The combination, with a sanding-machine having a delivery-chute and a platform extended therefrom to hold two or more of the molds, of a primary pusher to shift the molds successively to the adjoining portion of the platform when delivered from the chute, a secondary pusher connected thereto for pushing the molds off of the platform, a safety truck or support to hold the primary pusher from engagement with the mold, and means actuated by each mold to prevent the engagement of the primary pusher with the mold, until the secondary pusher has removed them from the platform.

5. The combination, with a sanding-machine having a delivery-chute and a platform extended therefrom to hold two or more of the molds, of a primary pusher to shift the molds successively to the adjoining portion of the platform when delivered from the chute, a secondary pusher to shift the molds from the platform, a pusher guide or track for containing the primary pusher in an operative position adjacent to the platform, a safety-truck adjacent to the pusher-guide, the safety-truck having a removable section at its rear end as set forth, means to hold such section normally open, and a lever projected in the path of the mold when shifted by the primary pusher, and having connections to the removable track-section and operating to hold the track closed until the secondary pusher removes such mold.

6. The combination, with a sanding-machine having a platform and means for automatically delivering the molded molds thereon, of a pusher for shifting the molds upon the platform, a pusher guide or track for containing the pusher in an operative position adjacent to the platform, a safety-truck adjacent to the pusher-guide, the safety-truck having a removable section at its rear end as set forth, means for holding such section normally open, and the toe projected in the path of the mold when

wholly discharged upon the platform from the sowing-machine, and connections between each toe and the removable track-section to open the same, when the toe is moved.

7. The combination, with a brick-machine having a table to receive the molds for filling, of a platform extending from each table, a sowing-machine with devices for delivering the sanded molds upon each platform, a pusher reciprocated by connection with the brick-machine to shift the molds from the platform to the table, and means actuated by the molds in their transit to the table for preventing the access of the pusher to a succeeding mold upon the platform, until the preceding mold is removed from the table.

8. The combination, with a brick-machine having a table to receive the molds for filling, and the shifter D to shift the molds thereon, of a platform extending from each table, a sowing-machine with devices for delivering the sanded molds upon each platform, a pusher reciprocated by connection with the brick-machine to shift the molds from the platform to the table, a pusher guide or track for containing the pusher in an operative position adjacent to the platform, a safety-track adjacent to the pusher-guide, the safety-track having a removable section at its rear end as set forth, and means connected with the mold-shifter D upon the table for closing the track by such section and preventing the access of the pusher to a succeeding mold upon the platform, until the preceding mold is removed from the table.

9. In a brick-mold-sanding machine, the combination, with a sanding-cylinder having rotary heads to move the mold therein, and having opening at the side to insert the molds, of anti-friction-rolls arranged at opposite ends of the opening to support the molds, and the rolls at each end being formed in an overlapping series to furnish a nearly continuous support, substantially as herein set forth.

10. In a brick-mold-sanding machine, the combination, with a sanding-cylinder having a central driving-shaft *a*, of heads *b* to move the molds in the cylinder, the heads having seats for the molds with a driving-lag *c* at one end of each seat, and a curved guide-rib *d* adjacent to the opposite end of each seat to support the molds and deliver them gradually to the seat.

11. In a brick-mold-sanding machine, the combination, with a sanding-cylinder having a central driving-shaft *a*, of heads *b* to move the molds in the cylinder, the heads having seats for the molds with a driving-lag *c* at one end of each seat, and a safety-rib *d* upon each seat adapted to enter the inverted molds and to prevent non-inverted molds from access to the seat.

12. In a brick-mold-sanding machine, a sanding-cylinder having rotary heads to move the molds therein and having an opening in the side to insert the molds, and an opening in the top to discharge the same, a reversing-cylinder mounted over the opening in the top of the sanding-cylinder with discharge-outlet upon one side, ways adapted to transfer the molds from the rotary heads into the bottom of the reversing-cylinder, the rotary disks in each cylinder with projections adapted to carry the molds around within the same and deliver them right side up to the discharge-opening, and a hammer within the reversing-cylinder actuated by a cam upon the disk shaft to strike the bottom of each mold in its transit to the reversing-cylinder.

702,825. MARKER FOR SEED-PLANTERS. HENRY E. SCHROEDER, Inventor, by Joseph C. Beck and William W. Burrill, Attorneys, Akron, Iowa. Filed Apr. 17, 1902. Serial No. 100,417. (No model.)

Claim.—1. In a marking device for seed-plants, the combination with a rotary frame, dogs carried by said frame, a pivoted marker, one end of which is arranged within the path of movement of said dogs, means for thrusting the outer end of the marker in contact with the ground, and a spring-actuated plunger for elevating said marker from contact with the

ground and restoring it to its normal position within the path of movement of the dogs, substantially as set forth.

2. In a marking device for seed-plants, the combination with a rotary frame, of dogs pivoted to said frame to yield inwardly during a portion of their rotation with said frame and to be moved outwardly into their normal position, a pivoted marker, one end of which is arranged within the path of movement of said dogs, a spring for thrusting the outer end of the marker in contact with the ground, and a spring-actuated plunger for elevating said marker from contact with the ground and restoring it to its normal position within the path of movement of the dogs, substantially as set forth.

702,826. COMBINED AXIAL AND RADIAL TURBINE. RICHARD BERNHARD, Berlin, Germany. Filed Sept. 20, 1901. Serial No. 78,894. (No model.)

Claim.—1. In a turbine, the combination with a suitable casing, gates thereon and a shaft, of an axial turbine, buckets thereon cooperating with the gates and a radial turbine on one end of the axial turbine having buckets on one face thereof, and means to admit live steam to both faces of the radial turbine to balance the axial thrust on the turbine, substantially as described.

2. A combined axial and radial turbine, comprising a suitable casing provided with an annular inlet and an annular exhaust chamber, gates arranged on the casing, a drum carrying the buckets to form an axial turbine and a radial turbine formed on the end of the axial turbine and arranged in the annular inlet-chamber, substantially as described.

3. A combined axial and radial turbine, comprising a suitable casing provided with annular inlet and outlet chambers and suitable gates, a drum carrying the buckets to form an axial turbine, a radial turbine formed on the end of said drum and projecting into the annular inlet-chamber, and a passage through the interior of said drum, whereby steam can be exhausted from the radial turbine through said drum to the annular exhaust-passage, substantially as described.

4. In a turbine, the combination with a casing, gates thereon and annular inlet and exhaust chambers formed thereon, and suitable heads one of which is provided with gates, of a turbine-drum intermediate the inlet and exhaust chambers, an annular plate projecting into the inlet-chamber, suitable buckets thereon cooperating with the gates on the head, and a passage between the radial turbine-body and a wall of the inlet-chamber along its face to admit steam to the turbine on said drum and thereby produce an axial pressure on the back of said radial turbine contrary to that produced on the working face, substantially as described.

5. The combination of a suitable casing, an annular inlet-chamber formed at each end, an annular chamber formed intermediate the ends, heads for the casing, gates thereon and on the casing, of a pair of turbine-drums provided with buckets cooperating with the gates on the drum, a passage between the drums in register with the exhaust-chamber, an annular plate on each drum projecting into an inlet-chamber and provided with buckets to cooperate with the gates on the casing-heads, and means for admitting steam to one or the other of said drums, substantially as described.

6. The combination of a suitable casing provided with annular inlet and exhaust chambers, of a combined axial and radial turbine, the latter arranged to neutralize its own axial thrust, and another turbine or turbines on the same shaft arranged to run in an opposite direction, substantially as described.

7. In a turbine, the combination with a suitable casing, gates thereon, an annular inlet-chamber formed at one end and a suitable exhaust-passage, of a shaft, an axial turbine thereon cooperating with gates on the casing and having a central passage therethrough, a radial turbine on an end of the axial turbine and projecting into the inlet-chamber, whereby steam will be admitted to both faces of the radial turbine to balance its thrust and be divided thereby, one part passing through the radial turbine to drive it, then through the interior of the axial turbine to the exhaust and the other passing through the axial turbine to drive it, substantially as described.

702,827. CURTAIN OR SHADE FIXTURE. FRANK E. SHERIDAN, Denver, Colo. Filed Oct. 18, 1901. Serial No. 78,898. (No model.)

Claim.—In a curtain or window-shade fixture, suitable hanger, a curtain or shade roller engaging the hanger and a cord connecting therewith, one of said hangers having spring locking-flanges on its side to bind against the flat projecting end of the roller to hold the roller in engagement with the hanger, substantially as and for the purpose set forth.

702,828. APPARATUS FOR GOLF PRACTICE. ALFRED R. SMITH, Reading, England. Filed Oct. 27, 1901. Serial No. 78,897. (No model.)

Claim.—1. In a golf-practice apparatus, a target consisting of a vertical base-plate and a forwardly-inclined and upwardly-extending plate, substantially as specified.

2. In a golf-practice apparatus, a target consisting of a base portion and a forwardly-inclined upper portion, and downwardly-extending fastening-rods to hold the target against rearward movement.

702,829. BICYCLE-WHEEL CARRIER. CLAUDE R. SMITH, Claim, N. Y., assignor of one-half to Harry J. Smith, Claim, N. Y. Filed Nov. 1, 1901. Serial No. 80,798. (No model.)

Claim.—1. The combination with a bicycle, of a supplemental axle rotatably hinged thereto at one end, a spindle adapted to be detachably secured in the free end of the supplemental axle, a combined lock-out and cone for retaining the spindle in position in the auxiliary axle, a wheel mounted on the free end of the axle, a delivery-box attached to the axle, a tongue secured at one end to the box, the opposite end of the tongue having hinged connection with the bicycle.

2. The combination with a bicycle of an auxiliary axle, a knuckle formed on one end thereof, a hinged clamp pivotally secured to the knuckle, means for detachably securing the clamp to any convenient portion of the bicycle, a spindle detachably received in the free end of the axle, a combined lock-out and cone for retaining the spindle in position, a wheel mounted on the free end of the axle, a delivery-box attached to the axle, a tongue secured to the delivery-box, the opposite end of the tongue hinged to the bicycle.

3. The combination with a bicycle, provided with a lateral projection, of an auxiliary axle, a knuckle connected to one end of the axle, a socket connected to the knuckle, the lateral projection receivable within the socket, means for removably retaining the projection in the socket, a wheel mounted on the free end of the axle, a delivery-box attached to the axle, a tongue connected to the box, the opposite end of the tongue having hinged connection with the bicycle.

4. The combination with a bicycle, of a supplemental axle, means for connecting one end of the axle to the frame of the bicycle, the axle provided with spindle detachably connected to its free end, a combined lock-out and cone for retaining the spindle in position, a wheel detachably mounted on the spindle, a delivery-box mounted on the axle, a tongue

secured to the delivery-box, the free end of the tongue detachably hinged to the frame of the bicycle.

5. The combination with a bicycle, of a supplemental axle, a knuckle pivotally secured to one end of the axle, an arm to which the knuckle is pivoted, a pair of hinged jaws to which the arm is secured at its opposite end, and means for detachably securing the jaws to the frame of the bicycle.

702,830. INCANDESCENT GAS-BURNER. CLARENCE W. TAYLOR, Sioux City, Iowa. Filed Apr. 7, 1902. Serial No. 101,781. (No model.)

Claim.—1. In an incandescent gas-burner, the combination with a mantle and a burner-tube, the latter provided with air-inlets, of a mixing-tube having a portion thereof corrugated or fluted, a cap mounted upon said corrugated portion for forming a series of air-passages independent of the mantle, a hood mounted on the burner-tube for supporting the mixing-tube, and a regulating-plate mounted in the burner-tube and adapted to be engaged by the hood for operating it.

2. In an incandescent gas-burner, a burner-tube, a gas-regulator mounted therein, a mixing-tube, and a cap mounted thereon, said cap and mixing-tube forming a series of air-passages independent of the mantle of the burner.

3. In an incandescent gas-burner, a mantle, a mixing-tube, means mounted upon the said mixing-tube to form air-passages between it and said tube, a burner-tube, a gas-regulating plate mounted therein, and means supported by the burner-tube and supporting the mixing-tube and adapted when rotated to operate the regulating-plate.

4. In a gas-regulating burner, a mantle, a gas and air mixing chamber, means mounted upon the gas and air mixing chamber to form per-

manent air-passages between said mantle and chamber, a burner-tube provided with permanent air-inlets, a gas-regulating plate within the burner-tube for supporting the gas and air mixing chamber, and a depending hood mounted upon the burner and engaging the plate for operating it.

5. A gas-burner consisting of a burner-tube provided with permanent air-inlets, a gas-regulating plate arranged in the burner, a sleeve supported by the burner, a hood carried by the sleeve and engaging with the said plate for operating it when said hood is rotated, a mixing-tube supported by the hood, said mixing-tube having its upper portion forming a gas and air mixing chamber with the walls thereof corrugated, a cap mounted upon the corrugated portion of the mixing-tube for forming between the said cap and walls of the mixing-chamber a series of independent air-passages, and a mantle supported by the said cap.

6. In an incandescent gas-burner, a burner-tube, a gas and air mixing-tube having its upper and forming a gas and air mixing chamber with the walls thereof corrugated, and a cap mounted upon the upper end of the mixing-tube and forming a series of independent air-passages between it and the walls of the mixing-chamber.

702,881. COMBINED DOUBLE ESCUTCHEON AND PAINT PROTECTOR. SAMUEL THURMAN, Chicago, Ill. Filed Aug. 20, 1901. Serial No. 73,946. (No model.)

Claim.—1. As an article of manufacture, a glass plate to be secured to a door, and provided with screw-holes, and annular bushings of soft metal mounted in said screw-holes for protecting said plate from strains.

2. As an article of manufacture, a glass plate to be secured to a door and provided with an integral circumferential bead for the purpose of reducing the area of contacting surfaces between said plate and said door, and also provided with holes fitted with annular bushings of soft metal to equalize strains on said plate, and with a rasping-surface to protect the plate from injury by the hand.

3. As an article of manufacture, a plate to be secured to a door, and provided with an integral circumferential bead for the purpose of reducing the area of contacting surfaces between said plate and said door, said plate having a general arched form for the purpose of strengthening the same, and also being provided with bushings of soft metal for further strengthening said plate by equalizing strains thereon.

702,882. THREAD-CUTTING MECHANISM FOR SEWING-MACHINES. ROBERT W. THOMAS, Lynn, Mass., assignor to the Philadelphia Sewing Machine Company, Camden, N. J., a Corporation of New Jersey. Filed June 7, 1902. Serial No. 69,742. (No model.)

Claim.—1. The combination of the sewing mechanism of the machine, with a knife for cutting the loop of needle-thread after the formation of a group of stitches, and mechanism for operating said knife by a two-stage movement, said mechanism having as elements a cam and intervening device for imparting the first stage of the movement to the knife, and a stop for preventing the knife from exceeding this first stage of movement, substantially as specified.

2. The combination of the sewing mechanism of the machine, with a knife for cutting the loop of needle-thread after the formation of a group

of stitches, and mechanism for operating said knife, said mechanism comprising a cam and intervening device for imparting the first stage of movement to the knife, a movable arm for arresting the movement of the driving-shaft of the machine, and means for transmitting the movement of said arm to the knife-operating device so as to impart the second stage of movement to the knife, substantially as specified.

3. The combination of the sewing mechanism of the machine, with a knife for cutting the loop of needle-thread after the formation of a group of stitches, and mechanism for operating said knife, said mechanism comprising a cam and intervening device for imparting the first stage of movement to the knife, a stop for arresting the parts in the position to which they have been adjusted by said cam, a movable arm for arresting the movement of the driving-shaft of the machine, means for transmitting the movement of said arm to the knife-operating device so as to impart the second stage of movement to the knife, and provision for releasing the stop, before each second movement, substantially as specified.

4. The combination of the sewing mechanism of the machine, a knife for cutting the loop of needle-thread on the completion of a group of stitches, and mechanism for imparting movement to said knife, said mechanism having as elements a rock-shaft with two arms, one of which carries a trip-lever adapted to restrict its movement in one direction, and a cam-disk having a cam for acting upon one arm of the rock-shaft to impart movement thereto, and another cam for tripping said stop-lever in order to permit further backward movement of the shaft, substantially as specified.

5. The combination of the sewing mechanism of the machine, the movable stop-arm which receives the impact of a moving part of the machine in stopping the same, a work-holding clamp and means whereby the movement of the stop-arm is transmitted to the movable jaw of said work-holding clamp so as to open the same, substantially as specified.

6. The combination of the sewing mechanism of the machine, the movable stop-arm which receives the impact of a moving part of the machine in stopping the same, a work-holding clamp, means whereby the movement of the stop-arm is transmitted to the movable jaw of said work-holding clamp so as to open the same, and a lock for retaining it in the opened position, substantially as specified.

7. The combination of the sewing mechanism of the machine, a knife for cutting the loop of needle-thread after the completion of a group of stitches, the work-holding clamp, mechanism for operating the cutting-knife by a two-stage movement, the second stage being due to a movable stop-lever, means for transmitting the movement of said stop-lever to the work-holding clamp so as to release the work, and locking device for both the knife-operating mechanism and the clamp-releasing device, whereby the movement of the knife is arrested after it has received the first stage of its movement, and the work-holding clamp is held in the opened position until released, substantially as specified.

8. The combination of the driving-shaft of the sewing-machine, a

movable stop which receives the impact of a moving part of the machine and arrests its forward movement when a group of stitches has been completed, and an automatic catch independent of said stop for preventing backward movement of the driving-shaft after its forward motion has been arrested, substantially as specified.

9. The combination of the sewing mechanism of the machine, a needle-thread clamp mounted upon the needle-bar, and mechanism whereby said clamp is caused to confine and release the needle-thread, substantially as specified.

10. The combination of a sewing-machine having sewing mechanism for forming, in the work, a group of stitches with a two-thread lock-stitch, and cutting mechanism arranged and operated on one side of the work for automatically covering both the threads substantially at the stitching-point upon the completion of the group of stitches, substantially as specified.

11. The combination of a sewing-machine having sewing mechanism for forming a group of stitches with double-thread lock-stitch, with an arm having knives, one for cutting the loop of needle-thread and the other for cutting the under thread after formation of the group of stitches has been completed, and means for operating said knives, substantially as specified.

12. The combination of a sewing-machine having sewing mechanism for producing a group of stitches with a double-thread lock-stitch, with knives for automatically covering both threads after the completion of the group of stitches, and means for operating said knives, the knife for covering the under thread following the knife for covering the needle-thread in its action, substantially as specified.

13. The combination of a sewing-machine having sewing mechanism for producing a group of stitches with a double-thread lock-stitch, and knives, one for covering the needle-thread and the other for covering the under thread after the completion of the group of stitches, and means for operating said knives, said under-thread-covering knife occupying a position between the needle-thread-covering knife and the under side of the throat-plate of the machine, substantially as specified.

14. The combination with a sewing-machine having sewing mechanism for producing, in the work, a group of stitches, of a cutting mechanism comprising a thread-cutting knife having a forwardly-projecting finger and, in the rear of the same, a cutting edge consisting of a blade projecting in a different plane from the body of the knife, substantially as specified.

15. In a sewing-machine, stitch-forming device, comprising upper-thread mechanism and under-thread mechanism, and automatically-cutting means for cutting the upper and under threads below the work.

16. In a sewing-machine, the combination with stitch-forming device comprising upper-thread mechanism and under-thread mechanism, of a cutting device and automatic means for causing said device to cover first one of the threads and then the other.

17. In a sewing-machine, stitch-forming device, comprising an upper-thread mechanism, and an under-thread mechanism, a cutting device, and automatic means for actuating said cutting device to cover the under thread below the work.

18. A sewing-machine, comprising two-thread stitch-forming device, a cutting device located below the work and having two cutting edges, one for the upper thread and the other for the lower thread, and means for operating said cutter.

19. In combination with a two-thread sewing-machine, a cutter and automatic means to cause it to cover the under thread below the work immediately upon the completion of a stitching operation.

20. In combination with a two-thread sewing-machine, a device located below the work-plate for cutting the upper and under threads, means for operating said device, and means for locking said device in an inoperative position.

21. In combination with a two-thread sewing-machine, a device located below the work for cutting the under and the upper threads, means for intermittently operating said cutting device, and means for intermittently locking said device in an inoperative position.

22. In a sewing-machine, the combination with stitch-forming device comprising an upper-thread mechanism and an under-thread mechanism, of a cutting device movably mounted on the machine, and means for actuating said cutting device to cover the under thread independently of the needle-thread, substantially as described.

702,883. ELECTRIC HEATING-HEATER. EMERY VOGLER, New Orleans, La. Filed Mar. 15, 1902. Serial No. 94,977. (No model.)

Claim.—1. The combination, with a beehive, of an exterior, detachable, air-heating attachment comprising an open-end tube which is held in a bore in the hive and projects therefrom, and a heating medium, contained within the tube, and means for heating the air passing through the tube into the hive as described.

2. The combination with a beehive of an air-heating attachment comprising an open-end tube held in an opening in the hive-wall, an incandescent electric lamp, supported within said tube, and having conductors extended out of the same, as shown and described.

3. The combination with a beehive of an air-heating attachment consisting of an open-end tube which is held in an opening in the hive-wall, and inclined downward therefrom, and a lamp contained and duly supported in the tube, as shown and described.

4. The air-heating attachment for a beehive, consisting of an open-end tube and an incandescent electric lamp secured within the tube, as shown and described.

5. The combination with a beehive of an air-heating attachment comprising an open-end tube made in two longitudinal parts adapted to be easily separated, and a lamp contained in an enlargement of the passage in said tube and having greater diameter than the opening at either end of the tube, as shown and described.

6. The combination with a beehive of the air-heating attachment comprising an open-end tube having its passage provided with support for a lamp whereby the latter is held out of contact with the bottom of the same, as shown and described.

7. The combination with a beehive of the air-heating attachment comprising a lamp and a tube which is open at each end and provided with an inspection-opening at the point where the lamp is located, said opening being closed to passage of air by a transparent medium, as shown and described.

702,884. BRAKE FOR HOISTING APPARATUS. HERMANN VOIGT, Essen, Germany, assignor to Fried. Krupp, Essen, Germany. Filed Jan. 26, 1901. Serial No. 44,785. (No model.)

Claim.—1. The combination of two friction-disks having relative lateral movement, means tending to hold the disks together continuously, a friction-ring surrounding the disks, and means adapted to hold the ring against movement.

2. The combination of two friction-disks having relative lateral movement, a spring tending to hold the disks together, a friction-ring surrounding the disks, and means adapted to hold the ring against movement.

3. The combination of two friction-disks having relative lateral movement, means tending to hold the disks together continuously, a friction-ring surrounding the disks, and an eccentric wedging-dog adapted to hold the ring against movement.

4. The combination of the shaft, two friction-disks to turn in unison upon the shaft, one of which is movable from and toward the other, two cup-shaped springs mounted upon the shaft, tending to hold the disks together, a friction-ring surrounding the disks, and an eccentric wedging-dog adapted to hold the ring against movement upon rotation of the shaft in one direction, and to release the ring upon rotation of the shaft in the reverse direction.

5. The combination with the shaft, of disks mounted thereon, a friction-ring surrounding the disks, and an eccentric wedging-dog forcing the ring into engagement with the disks.

6. The combination with the shaft, of friction-disks mounted thereon, a spring tending to force the disks together, and means adapted to be forced into engagement with the disks to act as a brake.

7. The combination of the friction-disks, a spring tending to force the disks together, a friction-ring surrounding the disks, and an eccentric wedging-dog adapted to force the ring into engagement with the disks.

8. The combination with a shaft of two friction-disks having conical peripheries mounted upon the shaft and movable longitudinally thereon, cup-shaped springs mounted upon the shaft and tending to force the disks together, a friction-ring surrounding the disks, and an eccentric wedging-dog adapted to force the ring into engagement with the disks.

702,885. RANGE-FINDING AND SURVEYING INSTRUMENT.
JAMES WADSWORTH, Glasgow, Scotland. Filed July 2, 1901. Serial No. 64,890. (No model.)

Claim.—1. A range-finder having a base, a telescope mounted on one side thereof, a ring pivoted to the base, and extending inward across the ring, substantially as described.

2. A range-finder having a base, a telescope, a saddle mounted on one side thereof, a ring pivoted beneath said telescope and passing through the saddle, a telescope on the opposite side of the pivot on the ring and an arm pivoted to the frame, and to the ring, and extending across the ring, substantially as described.

3. A range-finder having a base, a telescope mounted on one side thereof, a ring pivoted to the base, a telescope on the ring, an arm pivoted to the base and to the ring, and extending across the ring, a rack on the arm, a worm and worm-wheel on the frame, to turn the rack, substantially as described.

4. A range-finder having a base, a telescope mounted on one side thereof, a ring pivoted to the base, a telescope on the ring, an arm pivoted to the base and to the ring, and extending across the ring, a rack on the arm, a worm and worm-wheel on the frame, to turn the rack, and a graduated scale at the end of the arm, substantially as described.

5. In range-finding instruments, a frame, a telescope carried thereon, a ring pivoted to the frame, and a telescope rigidly mounted on the ring, an indicating arm and scale on the frame extending across the ring, link connections between the ring and arm and means for operating the ring through the medium of the arm, in combination with an adjustable cradle to support the frame, a pillar and a tripod, said tripod having turning and clamping appliances and a graduated stay-rod, as and for the purpose described.

6. A range-finder having a base, a telescope mounted on one side thereof, a ring pivoted to the base, a telescope on the ring, an arm pivoted to the base, carrying a stud, links pivoted to the stud and to the ring, and an opening in the ring through which the stud passes free from contact with the sides thereof, substantially as described.

7. A range-finder having a base, a telescope mounted on one side thereof, a ring pivoted to the base, a telescope on the ring, an arm pivoted to the base, carrying a stud, links pivoted to the stud and to the ring, and an opening in the ring through which the stud passes free from

contact with the sides thereof, and arms extending inward across the ring, in combination with gearing for moving said arm and a scale on the frame over which said arm moves, substantially as described.

8. In combination with a range-finder having a frame, a supporting pillar, two telescopes and a graduated scale, a stay-rod secured to the frame at one end, and adjustably secured to the pillar at the other end, and a graduated scale on the stay-rod, as and for the purpose described.

702,886. GUIDE FOR METAL-BENDING MACHINES. CHARLES WHEAT, Pittsburgh, Pa. Filed Mar. 3, 1901. Serial No. 65,408. (No model.)

Claim.—1. In a metal-bending machine, a bending mechanism, a guide receiving the bent metal and having a rotatable and transverse adjustment to the line of feed.

2. In a metal-bending machine, a bending mechanism, a guide receiving the bent metal, and rotatable and adjustable in a plane transversely of the working face of the bending mechanism.

3. In a metal-bending machine, a bending mechanism, a guide for receiving the bent metal and preventing its distortion, having a carriage adjustable transversely of the line of feed, a table rotatably mounted on the carriage, and a set of rolls carried by the table.

4. In a metal-bending machine, a set of bending-rolls, and a guide for receiving the bent metal, having a table rotatable in a plane transversely of the axis of the bending-rolls and adjustable in the plane of the table.

5. In a bending-machine, a bending mechanism, a guide receiving the bent metal and having a table adjustable transversely of the line of feed, horizontally and vertically adjustable journal-bases thereon, and rolls carried by the journal-bases, one of said rolls having a bevel-face.

702,887. FLOOR-JACK. ROBERT J. WHELAN, Orem, Utah, U. S. A. Filed Feb. 25, 1901. Serial No. 65,417. (No model.)

Claim.—1. In a floor-jack, the combination with the tongue, of the leg pivotally mounted thereon, the catch-dog fork pivotally mounted on the pivot of the tongue and the catch-dog pivotally mounted on said fork, all substantially as shown and described.

2. In a floor-jack, the combination with the tongue, of the leg pivotally mounted thereon, the catch-dog fork pivotally mounted on the pivot of the tongue, the catch-dog base secured thereto, the catch-dog pivotally mounted thereon on a pivot at right angles to the pivot of the fork, and the page carried by the jaws of the tongue, as set forth.

3. In a floor-jack, the combination with the tongue and the leg pivotally mounted thereon, of the catch-dog base, the catch-dog fork to which the same is secured pivotally mounted on the pivot of the tongue and the catch-dog pivotally mounted on said fork, all substantially as described.

4. In a floor-jack, the combination with the tongue, of the leg pivotally mounted thereon and bifurcated and provided with a thumb-screw, the catch-dog fork pivotally mounted on the pivot of the tongue, the catch-dog base secured within a mortise therein, and the catch-dog pivotally mounted on said fork, the dog and leg being upon opposite sides of the tongue to move in opposite directions, and the fork movable on its pivot at right angles to the plane of movement of the dog, as shown and described.

702,888. FOLDING BED AND WARDROBE. CHARLES J. WHEAT, Alexandria, Ind. Filed Feb. 25, 1902. Serial No. 65,500. (No model.)

Claim.—1. In a folding bed, the combination with two movable sections and a flexible mattress secured at both ends to one section, of means secured to the other section holding the mattress stretched irrespective of the position of the said sections.

2. In a folding bed, the combination with two sliding sections and a flexible mattress attached at both ends to one section, of means secured to the other section holding the mattress taut irrespective of the relative position of the said sections.

3. In a folding bed, the combination with two sliding sections and a flexible mattress fixed at its ends to one of said sections, of movable means secured to the other section to take up the slack in the mattress when the sections are closed together.

4. In a bed, of the character described, the combination with a movable foot-section comprising a wardrobe, a slot formed in the base of said section, a movable head-section having side plates rigidly attached thereto and adapted to slide in the slot of the other section, a roller journaled between the outer ends of said head-section and a roller journaled to the head-section, of a flexible mattress secured at both ends to the foot-section, the body portion of the mattress traveling over said rollers whereby it is held taut.

702,889. BEDSTEAD. CHARLES E. WHITE and FRANKLIN WHITE, Lancaster, Md. Filed Apr. 3, 1902. Serial No. 101,915. (No model.)

Claim.—1. In a bedstead, the combination of four bedposts, side bars each consisting of two bars placed in contact and fitting notches in said posts, bowed springs having downturned ends extending between said bars, and means for connecting said posts and clamping said bars together to hold said springs firmly in place, substantially as described.

2. In a bedstead, the combination with four posts, of side bars each comprising two bars in contact and fitting notches in said posts, bowed springs having downturned ends engaged by said bars, the rods fitting transverse apertures in said side bars and said posts, said rods having heads thereon which bear on the outer faces of said side bars, nuts mounted on said rods and bearing on the inner side of said posts and turn-buckles mounted on said rods, substantially as described.

702,840. MECHANISM FOR STRAIGHTENING BAILS, BARS, OR CHAINS. CHARLES E. WHITE, Moline, Ill. Filed Feb. 14, 1902. Serial No. 94,368. (No model.)

Claim.—1. In combination with a cooling-bed, means for pushing the bars to be straightened across the same, and a removable stop device adapted to temporarily arrest the advance of the bars.

2. In combination with a cooling-bed, means for pushing the bars to be straightened across the same, a removable stop device and means for setting the same in front of the bars.

3. In combination with a cooling-bed, means for successively advancing the bars to be straightened across the same, and means at or near the outer end of the bed for arresting temporarily the advance of the first bars delivered; whereby a number of bars may be accumulated and pressed against each other by the advancing means, and the accumulated bars thereafter advanced as mass and discharged from the bed.

4. In combination with a cooling-bed, means for delivering on the same the bars to be straightened, means for pushing the bars across the bed, a removable stop device adapted to be adjusted in front of the bars, whereby the bars are accumulated against the stop device, and means for removing the stop device to permit the accumulated bars to be advanced across the bed in a body.

5. In combination with a cooling-bed, a longitudinal straightening-bar movable thereover, means for controlling the operation of the same, a vertically-movable bar at the outer edge of the bed, and means for setting the said bar above the level of the bed.

6. In combination with a cooling-bed, a longitudinal straightening-bar movable from the inner end of the bed across the same, a longitudinal rocking bar at the opposite end of the bed, means for setting said rocking bar flush with the bed to form a continuation of the same, and means for setting the bar above the bed to form a stop.

7. In combination with a cooling bed, a rotary feed-roller below the same with its surface exposed through the bed, means for engaging the bars to be straightened with the exposed surface of the roller, a pushing or straightening bar in rear of the roller and movable thereover, and means for controlling the operation of said bar.

8. In combination with a cooling-bed, a pushing or straightening bar at one edge of the same and movable thereover, a series of feeding devices in front of the bar adapted to successively engage the bars to be straightened and to advance the same endwise along the bed, and means for operating the pushing-bar to push the bars to be straightened across the bed.

9. In an apparatus of the type described the combination with a cooling-bed of a longitudinal bar movable thereon and adapted to act on heated bars delivered to the bed, said longitudinal bar being composed of two sections in adjacent faces with longitudinal continuous channels and secured fixedly together face to face; whereby the bar as a whole will contain continuous longitudinal chambers made up of the channels in the opposing sections.

702,841. ELLIPTIC CHAIN DRIVING-GEAR. WILLIAM F. WILLIAMS, London, England. Filed June 20, 1901. Serial No. 65,999. (No model.)

Claim.—1. In rectilinear ball-bearings constituted by a pair of opposed grooves with interposed balls, the combination with a grooved block forming the one ball-race and fitted in a holder so as to be adjustable toward and away from the other ball-race, of a tubular set-screw screwing through the holder and bearing against the back of the adjustable block so as to hold said block unyieldingly up to its work, a screw-threaded stem attached to the block and passing through the tubular set-screw, and a lock-nut screwing on said stem and bearing against the end of the tubular set-screw so as to lock the block in the position to which it has been brought by said set-screw, substantially as specified.

2. In an elliptical chain driving-gear, the combination of a pedal-crank, an elliptical sprocket-wheel having diametrical arms, grooves in the opposite sides of the said arms, oppositely-arranged driving-arms secured to the boss of the pedal-crank and carrying guide-brackets, bearing-blocks fitted one in each bracket at opposite sides of the arms of the sprocket-wheel so as to be capable of adjustment toward and away from the sprocket-wheel arms and each provided with a groove of V-section registering with a groove of similar section in the arm, balls in the race formed by said grooves, a tubular set-screw screwing through each bracket and bearing against the adjustable block therein so as to unyieldingly hold said block up to its work, a screw-threaded stem attached to each adjustable block and passing through the tubular set-screw and a lock-nut screwing on each said stem and bearing against the corresponding set-screw so as to enable the correct position of the sprocket-wheel relatively to its driving-arms to be maintained in all positions of adjustment.

702,842. ELLIPTIC CHAIN DRIVING-GEAR. WILLIAM F. WILLIAMS, London, England. Filed Jan. 19, 1901. Serial No. 48,328. (No model.)

Claim.—1. In a pedal-operated driving-gear in which an elliptical sprocket-wheel is movable in its own plane relatively to its axle but maintained in driving connection therewith, the combination with the opposite faces of the sprocket-wheel of sets of cover-plates cooperating to exclude dust, and comprising for each set a plate fixed to the wheel and apertured to give clearance for the axle and attached parts relatively to which the wheel is transversely movable, a second or intermediate cover net

movable transversely of the axle and adapted to cover the aperture in the first plate and to make light rubbing contact with said plate, and a third cover-plate attached to the first, adapted to inclose the joint between the first and second plates; apertured to give clearance to the axle and attached parts and adapted to make light rubbing contact with the second or intermediate plate, substantially as specified.

2. In a pedal-operated driving-gear the combination with a sprocket-wheel movable in its own plane relatively to the axle, of a set of superposed cover-plates whereof the one is attached to the sprocket-wheel and movable therewith relatively to the other, and is apertured to clear the said axle and attached parts in all positions of the wheel, and of a dust-excluding packing surrounding the aperture of the movable plate, and formed of fibrous material attached to and projecting from the face of the one cover and pressing against the adjacent surface of the other cover-plate, substantially as specified.

3. In a pedal-operated driving-gear the combination with a sprocket-wheel movable in its own plane relatively to its axle, of a set of superposed cover-plates whereof the one is attached to the sprocket-wheel and is movable therewith relatively to the other, and is apertured to clear the said axle and attached parts in all positions of the wheel, and of a dust-excluding packing surrounding the aperture of the movable plate, and formed of fibrous material held in and projecting from a groove formed in the one plate and projecting therefrom so as to press against the adjacent surface of the other cover-plate, substantially as specified.

4. In a pedal-operated driving-gear the combination with a sprocket-wheel movable in its own plane relatively to its axle, of a series of three superposed cover-plates comprising a plate attached to the wheel and apertured to clear the axle and attached parts in all positions of the wheel, an intermediate plate attached to the axle-hub and covering the said aperture, an outer cover-plate apertured to clear the axle, overlapping the margin of the intermediate plate and in interlocking connection with the first plate so as to move therewith, and fibrous packings respectively surrounding the said apertures, said packings being respectively attached to and projecting from the face of the one of two adjacent plates and bearing against the other plate, so as to make a dust-excluding sliding joint between the two adjacent plates as described.

702,843. MANUFACTURE OF SEAMLESS SOCKS WITH LACEWORK STRIPES. WALLACE WILSON, Philadelphia, Pa. Filed June 16, 1901. Serial No. 64,642. (No model.)

Claim.—1. A continuously-knit seamless stocking, the leg of which is provided on all sides with alternate sections of plain knitting and sections containing lines of tuck-stitches; of the stripes thus formed these down the back of the leg being formed by the alternation of tuck-stitches and plain stitches; these down the front of the leg being formed by the interstep of the foot; and the heel and toe patches and the sole of the foot being formed of plain knitting, substantially as described.

2. A continuously-knit seamless stocking, the leg of which is provided on all sides with alternate sections of plain knitting and sections containing lines of tuck-stitches; of the stripes thus formed these down the back of the leg being formed by the alternation of tuck-stitches and plain stitches; these down the front of the leg being formed with alternate tuck-stitches and omitted stitches, and being prolonged down the instep of the foot; and the heel and toe patches and the sole of the foot being formed of plain knitting, substantially as described.

3. The process of knitting a seamless stocking, with lacework stripes down both the front and back of the leg and the instep of the foot, upon a circle of needles comprising plain needles and tuck-needles at intervals, both front and rear, corresponding to the position of the stripes to be produced, which comprises the following cycle of operations: first, knitting the leg upon the whole circle with the tuck-needles operating to tuck at regularly-recurring intervals; second, knitting the heel upon the rear fashioning set with the tuck-needles operating as plain needles; third, knitting the foot upon the whole circle with the front tuck-needles operating to tuck and the rear tuck-needles operating as plain needles; fourth, knitting the toe upon the rear fashioning set with the tuck-needles operating as plain needles, substantially as described.

4. A machine-knit stocking having a tubular portion formed of a single thread at one continuous operation; said stocking having in one half of its tubular surface a section or sections of tuck-stitches alternating with a section or sections of plain knitting; and upon the other half of its tubular surface a section or sections of open or lace work tuck-

stitches alternating with a section or sections of plain knitting, substantially as described.

5. A machine-knit stocking, having a tubular portion formed of a single thread at one continuous operation; said thread being knit into alternate sections of plain knitting and sections of tuck-stitches consisting of a plurality of threads formed into a single elongated loop, to form one half of the tubular surface of the fabric; the said thread being knit into alternate sections of plain knitting and sections of lace work, consisting of a series of elongated superimposed loops separated from adjacent loops by a space with a series of loose crossing threads spanning said space and interlocked with the elongated loops, to form the remaining half of the tubular surface of the fabric, substantially as described.

6. A machine-knit stocking having a toe, heel, and leg portion knit continuously from a single thread at one operation; the rear portion of the leg of the stocking being formed of tuck-stitches alternating with plain knitting; the heel, sole, and toe portions of the stocking being formed of plain knitting; and the front of the leg and instep portion of the foot of the stocking being formed of alternate sections of regular and open or lace work tuck-stitches, substantially as described.

7. A machine-knit seamless tubular stocking having a toe, heel, and leg knit continuously from a single thread at one operation; the rear portion of the leg portion being formed of alternate sections of tuck-stitches and plain knitting extending down to the heel portion of the stocking; and the heel, sole, and toe portions being formed of plain knitting, substantially as described.

702,844. ELECTRICITY-METER. ARTHUR WASSER, Brighton, England, assignor to Mutual Electric Trust, Limited, Brighton, England. Filed May 20, 1902. Serial No. 14,194. (No model.)

Claim.—1. An electrolytic mercury-meter comprising a means for setting up currents in the electrolyte near the anode whereby that portion of the electrolyte which has been enriched by mercury is removed from the neighborhood of the anode, substantially as described.

2. An electrolytic meter comprising two electrodes of mercury, the anode being placed at a higher level than the cathode for the purpose stated.

3. An electrolytic mercury-meter comprising two electrodes, one at least of mercury, the anode being placed at a higher level than the cathode, for the purpose stated.

4. An electrolytic meter comprising two electrodes of mercury, and a heating device for setting up convection-currents in the electrolyte near the anode for the purpose stated.

5. An electrolytic meter comprising two electrodes, one at least of mercury, and a heating device for setting up convection-currents in the electrolyte near the anode, for the purpose stated.

6. An electrolytic meter comprising two electrodes, one at least of mercury, and an electric heating resistance for setting up convection-currents in the electrolyte near the anode, for the purpose stated.

7. An electrolytic mercury-meter comprising an intermediate chamber inserted in the path of flow of the mercury for the purpose of feeding the mercury in minute quantities, substantially as described.

8. An electrolytic mercury-meter comprising an intermediate chamber inserted in the path of flow of the mercury of the cathode for the purpose of feeding the mercury in minute quantities, substantially as described.

9. An electrolytic mercury-meter comprising a receptacle for the mercury anode and a lip or ridge in the path of flow of the mercury of the anode, substantially as described.

10. An electrolytic mercury-meter comprising an anode-chamber and an anode-feeder for supplying mercury thereto, substantially as described.

11. An electrolytic mercury-meter comprising an anode-chamber and a graduated anode-feeder for supplying mercury thereto, substantially as described.

12. An electrolytic meter comprising a primary measuring-chamber for the mercury and a secondary measuring-chamber of more delicate calibration connected therewith, substantially as described.

13. An electrolytic mercury-meter comprising a primary measuring-chamber for the mercury and a secondary measuring-chamber connected thereto and constructed to empty its entire contents into the primary chamber when filled, substantially as described.

14. An electrolytic mercury-meter comprising a primary measuring-chamber and a secondary measuring-chamber in the form of a siphon-tube connected therewith, substantially as described.

15. An electrolytic mercury-meter comprising the anode and cathode chamber, a primary measuring-chamber, a secondary measuring-chamber in the form of a siphon-tube connected with the above-specified chambers and a tube for the flow of the electrolyte connecting the primary measuring-chamber with the anode and cathode chamber, substantially as described.

16. An electricity-meter comprising a primary measuring-chamber and a secondary measuring-chamber connected thereto and constructed to empty its entire contents into the primary chamber when filled, substantially as described.

17. An electricity-meter comprising a primary measuring-chamber and a secondary measuring-chamber in the form of a siphon-tube connected therewith, substantially as described.

702,845. DIRECT OR CONTINUOUS CURRENT ELECTRICITY-METER. ARTHUR WASSER, Brighton, England, assignor to the Mutual Electric Trust, Limited, Brighton, England. Filed May 21, 1902. Serial No. 14,208. (No model.)

Claim.—1. An electric measuring device for direct currents comprising an electrolytic meter and a means for producing a difference of potential arranged to counterbalance the back electromotive force of the meter, substantially as described.

2. An electric measuring device for direct currents comprising an electrolytic meter and a means for producing a difference of potential in

series therewith arranged to counterbalance the back electromotive force of the meter, substantially as described.

3. An electric measuring device for direct currents comprising an ohmic resistance in the circuit and in a shunt thereto an electrolytic meter and a means for producing a difference of potential arranged to counterbalance the back electromotive force of the meter, substantially as described.

4. An electric measuring device for direct currents comprising an ohmic resistance in the circuit and in a shunt thereto an electrolytic meter and a means for producing a difference of potential in series with the meter, and arranged to counterbalance the back electromotive force of the meter, substantially as described.

5. The combination of a bridging resistance between the two direct-current mains or conductors, an ohmic resistance interposed in one of said conductors and an electrolytic meter one of whose electrodes is connected to a point on the bridging resistance between the two conductors and the other electrode to that conductor in which the ohmic resistance is interposed, substantially as described.

702,846. ELECTRIC MAXIMUM-DEMAND INDICATOR. ARTHUR WHEAT, Brighton, England, assignor to The Mutual Electric Trust, Limited, Brighton, England. Filed June 20, 1900. Serial No. 21,834. (No model.)

Claim.—1. A meter for indicating the maximum electric demand in a period of time, comprising an angularly-movable vessel containing a material to be decanted and including a reservoir and receiver, the angular movement of the vessel decanting a portion of the material from the reservoir to the receiver, which varies with the extent of the maximum movement, substantially as described.

2. A meter for indicating the maximum electric demand in a period of time comprising an angularly-movable vessel, containing a material to be decanted, and including a reservoir and a receiver, and an electrical actuating device for angularly moving the vessel, substantially as described.

3. A meter for indicating the maximum electric demand in a period of time comprising an angularly-movable vessel, containing a material to be decanted, and including a reservoir and a receiver, and an electromagnet actuating device for angularly moving the vessel, substantially as described.

4. A meter for indicating the maximum electric demand in a period of time comprising an angularly-movable vessel, containing a material to be decanted, and including a reservoir and a receiver, and an actuator for angularly moving the vessel, substantially as described.

5. A meter for indicating the maximum electric demand in a period of time comprising an electric actuating device, and a liquid-indicator having a constricted passage operated thereby, substantially as described.

6. A liquid-indicator for indicating the maximum electric demand in a given time, comprising a tilting vessel including a reservoir, a feed-pipe, and a receiver fed therefrom by an amount of liquid which varies with the maximum tilt of the vessel, substantially as described.

7. A tilting liquid-indicator for indicating the maximum electric demand in a period of time comprising a reservoir, a feed-pipe having a constricted passage and a receiver fed therefrom by an amount of liquid varying with the maximum tilt of the indicator, substantially as described.

8. A tilting liquid-indicator for indicating the maximum electric demand in a period of time comprising a reservoir, a feed-pipe, a receiver

fed therefrom by an amount of liquid varying with the maximum tilt of the indicator, and a receiving-tube, substantially as described.

9. A meter for indicating the maximum electric demand in a period of time, comprising an armature, a heavily-irradiated coil actuating it, and a liquid-indicator consisting of a tilting vessel including a reservoir and a receiver fed therefrom by decantation, substantially as described.

10. A meter for indicating the maximum electric demand in a given limit of time comprising an armature, a heavily-irradiated coil actuating it, and a tilting liquid-indicator with a constricted feed-aperture operated by the armature, substantially as described.

11. A meter for indicating the maximum electric demand in a given limit of time comprising an armature, a heavily-irradiated coil actuating it, and a tilting liquid-indicator with a constricted feed-aperture and return-pipe operated by the armature, substantially as described.

12. A meter for indicating the maximum electric demand in a given limit of time comprising a stationary axial armature provided with a wing or wings at each end, a movable axial armature provided with a wing or wings at each end and actuated by the wings of the stationary armature and an indicator actuated by the movable armature, substantially as described.

13. A meter for indicating the maximum electric demand in a given limit of time comprising an electric actuating device and a tilting liquid-indicator adjustably connected to its movable part, substantially as described.

14. A meter for indicating the maximum electric demand, in a given limit of time comprising an electric actuating device and a tilting liquid-indicator connected to its movable part by a pivot upon which it may turn for resetting, substantially as described.

702,847. METERING OF ELECTRICITY. ARTHUR WHEAT, Brighton, England, assignor to The Mutual Electric Trust, Limited, Brighton, England. Filed June 20, 1900. Serial No. 21,699. (No model.)

Claim.—1. The combination of a demand-indicator and an electricity-meter in shunt thereof, substantially as described.

2. The combination of a demand-indicator and an electricity-meter in shunt thereof, the resistance or the demand-indicator, or part of it, serving as the shunting resistance for the electricity-meter, substantially as described.

3. The combination of a thermal demand-indicator and an electricity-meter in shunt thereof, the heating resistance of the demand-indicator, or part of it, serving as a shunting resistance for the electricity-meter, substantially as described.

4. The combination of a demand-indicator and an electrolytic meter in shunt thereof, the resistance of the demand-indicator or part of it, serving as the shunting resistance for the electrolytic meter, substantially as described.

702,848. ELECTRICITY-METER. ARTHUR WHEAT, Brighton, England, assignor to The Mutual Electric Trust, Limited, Brighton, England. Filed June 20, 1900. Serial No. 21,642. (No model.)

Claim.—1. An electrolytic mercury-meter comprising a movable electrode, the weight of the mercury on which varies during the passage of the current, and an indicator operated by its change of weight, substantially as described.

2. An electrolytic mercury-meter having its anode above the cathode, and having one or both electrodes movable, the weight of the mercury of the movable electrode varying during the passage of the current, and an indicator operated by its change in weight, substantially as described.

3. An electrolytic mercury-meter comprising a tilting electrode-chamber, the change in weight of the mercury on the cathode during the passage of the current causing a tilting of the chamber, and an indicator controlled by the tilting chamber, substantially as described.

4. An electrolytic mercury-meter, comprising a tilting electrode-chamber, the change in weight of the mercury on the electrodes causing a tilting of the chamber, and an indicator controlled by the tilting chamber, substantially as described.

5. An electrolytic mercury-meter comprising a tilting electrode-chamber, the increased weight of the mercury on the cathode and the diminished weight of the mercury-anode each causing a tilting of the chamber, and an indicator controlled by the tilting chamber, substantially as described.

6. An electrolytic mercury-meter comprising a tilting chamber, having the anode situated above the cathode, the change in weight of the mercury on the electrodes causing a tilting of the chamber, and an indicator controlled by the tilting chamber, substantially as described.

7. An electrolytic mercury-meter comprising a tilting electrode-chamber, the change in weight on the electrodes causing a tilting of the chamber, and an indicator comprising a driven register checked or restrained by the tilting chamber and permitted to be operated by the tilt of the chamber, and a restoring mechanism for the tilting chamber operated by the register, substantially as described.

8. An electrolytic mercury-meter comprising a tilting electrode-chamber, the change in weight on the electrodes causing a tilting of the chamber, an indicator comprising a driven register checked or restrained by the tilting chamber and permitted to be operated by the tilt of the chamber, and a restoring mechanism comprising a basket and chain for restoring the tilting chamber to engagement with the register, substantially as described.

9. An electrolytic mercury-meter comprising a tilting electrode-chamber, the change in weight on the electrodes causing a tilting of the chamber, an indicator comprising a driven register checked or restrained by the tilting chamber and permitted to be operated by the tilt of the chamber, and a restoring mechanism comprising a basket and chain for restoring the tilting chamber to engagement with the register, substantially as described.

702,849. MAXIMUM AND MINIMUM RECORDING ELECTRICITY-METER. ARTHUR WHEAT, Brighton, England, assignor to The Mutual Electric Trust, Limited, Brighton, England. Filed July 1, 1901. Serial No. 66,799. (No model.)

Claim.—1. A maximum and minimum electric recording-meter comprising an expansion-bulb, an expansion-lead and a trap between the two, substantially as described.

2. A maximum and minimum electric recording-meter comprising an expansion-bulb, a screw connected therewith and a trap-bulb surrounding the screw, substantially as described.

3. A maximum and minimum electric recording-meter comprising a plurality of expansion-bulbs on an expansion-lead and a screw or cross-tube therebetween, substantially as described.

4. A maximum and minimum electric recording-meter comprising a plurality of expansion-bulbs, cross-tubes, or cross-tubes connected to the expansion-bulbs and an expansion-lead connected to the cross-tubes, substantially as described.

5. A maximum and minimum electric recording-meter comprising an

index-tube, in which liquid collects, which is of substantially conical form, substantially as described.

6. A maximum and minimum electric recording-meter comprising an index-tube, in which liquid collects, which is substantially of a flat conical form, substantially as described.

7. A maximum and minimum electric recording-meter comprising a series of index-tubes connected with each other at their upper ends, substantially as described.

8. A maximum and minimum electric recording-meter comprising a series of index-tubes connected with each other and with the meter at their upper ends, substantially as described.

9. A maximum and minimum electric recording-meter comprising a series of index-tubes connected with each other at their upper ends, one of said tubes being conical, substantially as described.

702,850. ELECTRICITY-METER OF THE ELECTROLYTIC TYPE. ARTHUR WHEAT, Brighton, England, assignor to The Mutual Electric Trust, Limited, Brighton, England. Original application filed May 26, 1900, Serial No. 15,194. Divided and this application filed Aug. 5, 1902. Serial No. 101,623. (No model.)

Claim.—1. In a meter of the mercury electrolytic type, the combination of a mercury anode and a platinum cathode, the said cathode

having a portion below the level of the said anode substantially as set forth.

2. In a mercury electrolytic meter, the combination of a mercury anode and a conical platinum cathode, having a portion below the level of the said anode, substantially as described.

3. In a mercury electrolytic meter, the combination of a mercury anode and a hollow conical platinum cathode the said cathode having a portion below the level of the said anode, substantially as described.

4. In a mercury electrolytic meter, the combination of a mercury anode and a hollow conical platinum cathode, with its apex pointing downward and with an orifice at the said apex, the said apex being placed below the level of the said anode, substantially as described.

702,851. STEAM ROAD-ROLLER. THOMAS WISNET, Springfield, Ohio. Filed Feb. 26, 1902. Serial No. 95,799. (No model.)

Claim.—1. In a steam road-roller, the combination, with a horizontal roller provided with driving-wheels at its rear end, of a steering-roller located at the front of the roller, a horizontal yoke in which said roller is mounted, said yoke extending rearward from said roller under the roller, and a universal joint connecting said yoke with the under side of the boiler, said joint being located under the boiler and back of the front end of the same, whereby the boiler-front is unobstructed, substantially as described.

2. In a steam road-roller, the combination, with a horizontal roller provided with driving-wheels at its rear end, of a steering-roller located at the front of the roller, a horizontal yoke in which said roller is mounted, said yoke extending rearward from said roller under the roller, and a universal joint connecting said yoke with the under side of the boiler, whereby the boiler-front is unobstructed, said yoke being provided with a rearward extension, and fixed horizontal guides between which said extension moves, substantially as described.

3. In a steam road-roller, the combination, with a horizontal roller provided with driving-wheels at its rear end and having a vertical housing located under its front end, of a king-post pivotally mounted in said housing, a horizontal yoke connected with said king-post by a horizontal pivot, and a steering-roller mounted in said yoke, substantially as described.

4. In a steam road-roller, the combination, with a boiler having a saddle-casting secured to its under side at the front and provided with a vertical housing, of a king-post mounted in said housing, a horizontal yoke pivotally connected with said king-post by a horizontal pivot and provided at its forward end with a steering-roller and at its rear end with a bearing-roller, and horizontal guides secured to a fixed part of the machine and receiving between them said bearing-roller, substantially as described.

5. In a steam road-roller, the combination, with a horizontal roller having a vertical housing secured underneath its front end, of a king-post mounted in said housing and having a bearing-surface upon which the lower end of the housing rests, and a transverse portion terminating in

front and rear bearing-disks, a steering-roller, a horizontal yoke in which said steering-roller is mounted, said yoke being provided with an opening having bearing-surfaces to abut against the bearing-disks of the king-post, and a horizontal pin passing through said yoke and through the king-post, substantially as described.

6. In a steam road-roller, the combination, with a horizontal roller having driving-wheels at the rear and a front tank, of a housing located under the front end of the roller, a king-post pivotally mounted in said housing, a horizontal yoke connected with said housing by a longitudinal pivot, a steering-roller mounted in the forwardly-extending arm of the yoke, said yoke being provided with a rearward extension, horizontal guide-pieces secured to the front of the tank, the rearward extension of the yoke being provided with a bearing-roller located between said pieces, and a brace-rod connecting the lower end of the king-post and the tank, substantially as described.

702,852. SLICING-MACHINE. CHARLES E. SUMNER, Brighton, N. Y. Filed Nov. 27, 1901. Serial No. 93,940. (No model.)

Claim.—1. In a slicing-machine, a frame comprising an annular ledge, an adjustable gage-plate, an orbitally-movable cup or holder pivotally mounted centrally within the frame and provided with a segmental runner which travels on the annular ledge, and a stationary ledge-blade connected with the frame and interposed between the gage-plate and cup or holder.

2. In a slicing-machine, the combination with a frame having an annular ledge, and a stationary ledge-blade extending across the frame, of an adjustable gage-plate arranged at one side of the ledge-blade, an orbitally-movable cup or holder at the opposite side of the ledge-blade, and a rotatable annular hand-grip mounted on said cup or holder.

3. In a slicing-machine, the combination with an annular frame provided with a groove extending transversely of the rim thereof, of an adjustable gage-plate fitted within the annular frame and provided with a tongue or projection movable in said groove, means for adjusting and holding the gage-plate, an orbitally-movable cup or holder, and a ledge-blade connected with the frame and interposed between the gage-plate and said cup or holder.

4. In a slicing-machine, the combination with an annular frame having a rim provided with openings, and an annular ledge connected with the rim and having diametrically opposite depressions, of a ledge-blade having its ends fitted flush within said depressions and provided with studs fitting the openings in the rim, an adjustable gage-plate located at one side of the ledge-blade, and an orbitally-movable cup or holder at the opposite side of the ledge-blade, substantially as described.

5. In a slicing-machine, an annular frame, a cross-bar extending diametrically thereof and provided with an upstanding stud and a depending post, in combination with an orbitally-movable cup or holder journaled on said stud, a movable gage-plate adjustable on said post, and a stationary ledge-blade interposed between the gage-plate and cup or holder and connected with the frame, substantially as described.

702,853. JEWELRY-DISPLAY TRAY. JOHN P. ANHILL, Pitts. Mass. Art. Filed May 7, 1902. Serial No. 14,794. (No model.)

Claim.—1. A display-tray for jewelry, having means for locking the separate pieces of jewelry therein, a key for unlocking such means, and means controlled by the piece of jewelry which prevents the withdrawal of the key until the piece of jewelry has been replaced, substantially as and for the purpose set forth.

2. A lock for a display-tray for jewelry, having means for locking the separate pieces of jewelry, a key for unlocking such means, means for locking the key, and means operated by the piece of jewelry for releasing the key-locking means, substantially as and for the purpose specified.

3. A lock for a display-tray for jewelry, having a jaw for locking a piece of jewelry, a jaw for locking a key, each first-mentioned jaw being adapted to be opened by said key, and each last-mentioned jaw being adapted to be opened by the engagement of the piece of jewelry therewith, substantially as and for the purpose described.

4. A lock for a display-tray for jewelry, having a jaw for locking a piece of jewelry, a jaw for locking a key, each last-mentioned jaw having notches to engage the key and prevent its withdrawal, and having an inclined surface or surfaces by the engagement of which with the piece of jewelry, said jaw is adapted to be moved to disengage the key, substantially as and for the purpose described.

5. A lock for a display-tray for jewelry, consisting of a plate having an opening therein, a jaw that normally overlies such opening, a spring tending to hold said jaw in its normal position, a second jaw having an inclined leg that normally overlies such opening, a spring tending to hold said second jaw in its normal position, in combination with a key that is adapted to move each first-mentioned jaw from over said opening, said second jaw having a part that is adapted to prevent the withdrawal of the key, and a holder for a piece of jewelry, each holder being adapted to enter the opening in the plate and to engage said inclined leg to release the key, and having a projection for engagement with each first-mentioned jaw, substantially as and for the purpose described.

6. A holder for displaying a ring, consisting of a body having means for engaging the inner surface of the ring, and having spring-arms that are adapted to fit against and extend along the rim of the ring, substantially as and for the purpose described.

7. A holder for displaying a ring consisting of a body, spring-arms that are adapted to fit against said ring, and a tongue that is adapted to be bent over and to secure such ring in the holder, substantially as and for the purpose set forth.

8. A holder for displaying a ring, consisting of an elongated body having a lock-engaging projection, spring-arms that are adapted to fit against said ring, and a tongue that is adapted to be bent over and to secure such ring in the holder, substantially as and for the purpose described.

9. In a display-tray for jewelry, the combination of a lock, and a part to cooperate therewith, adapted for attachment to a piece of jewelry, substantially as and for the purpose described.

702,854. APPARATUS FOR PRODUCING FINE OR NAP FABRICS. JOHN HAYES, Stockport, England, assignor of four-fifths to Robert John Chadwick Mitchell, Waterlool, England. Filed Jan. 11, 1902. Serial No. 93,971. (No model.)

Claim.—1. Apparatus for raising a pile on filled hat-bodies, consisting of a hat-form to the surface of which the hat-body is applied, a raising-roller secured near the surface of the hat-body and grooved guiding means for the raising-roller conforming to the contour of the hat-body, substantially as described.

2. Apparatus for raising a pile on filled hat-bodies consisting of a hat-form to the surface of which the hat-body is applied, a raising-roller secured near the surface of the body, two rollers, one on each side of the raising-roller, each arranged to bear on the fabric on the form near the raising-roller to prevent displacement of the fabric thereon by the raising-roller, and grooved guiding means for the latter to conform to the contour of the hat body and form, substantially as described.

3. Apparatus for raising the pile on filled hat-bodies consisting of a hat-form to the surface of which the hat-body is applied, a raising-roller adjustably secured near the surface of the body, two rollers, one on each side of the raising-roller, each arranged to bear on the fabric on the form near the raising-roller to prevent displacement of the fabric thereon by

the raising-roller, and grooved guiding means for the latter to conform to the contour of the hat body and form, substantially as described.

702,855. RETORT FOR GENERATING OXYGEN. FRANK A. FILLZ, Chicago, Ill., assignor of one-half to Morris Green, Marshalltown, Iowa. Filed Nov. 8, 1901. Serial No. 91,381. (No model.)

Claim.—1. In a retort of the class described, the combination with the outer wall, of partitions forming oxidizing and decolorizing chambers, a series of compartments in each chamber opening alternately near top and bottom, into the next succeeding compartments, a settling-compartment into which the last oxidizing-compartment opens at the top, a supply-chamber having an overflow-opening from the settling-chamber and opening near the bottom into the first decolorizing-compartment, an opening near the bottom of the last decolorizing-compartment into the first oxidizing-compartment, a series of air-pipes in the oxidizing-chamber, a series of steam-pipes in the decolorizing-chamber, said pipes terminating in an upward direction in the lower portion of the compartments which open near the top into the next succeeding compartments, and the oxidizing and decolorizing chambers being provided respectively with means for the escape of the nitrogen and the withdrawal of the oxygen, substantially as described.

2. In a retort of the class described, the combination with the outer wall, of a central hollow partition and partitions extending therefrom to the outer wall, suitable guides on the hollow partition and the outer wall, removable sliding partitions fitted to said guides, and suitable oxidizing and decolorizing apparatus located in the respective chambers between the said partition and the outer wall, substantially as described.

3. In a retort of the class described, the combination with a hollow cylindrical partition and partitions radiating therefrom to divide the retort into oxidizing and decolorizing chambers, said cylindrical partition being provided with openings above and below, opening respectively into the oxidizing and decolorizing chambers, of a series of radial partitions extending from the cylindrical partition to the outer wall, the alternate radial partitions terminating respectively short of the top and bottom of the retort, and suitable oxidizing and decolorizing apparatus located in the respective chambers and adapted to maintain a continuous circulation around the retort, substantially as described.

4. The combination with the cylindrical vessel, A, adapted for the purpose described, of the partitions, C, D, E, dividing the retort into an oxidizing and decolorizing and a supply chamber, the latter of which opens above the bottom into the oxidizing-chamber and near the bottom into the decolorizing-chamber, the partitions, M, terminating above and the partitions, M', open below the liquid-level, the deflectors, N, secured to the partitions, M', and suitable apparatus in the alternate compartments, formed by the partitions, M, M', adapted to effect the alternate oxidation and decolorization of a suitable liquid and also to keep the same in occasional circulation through the various compartments, substantially as described.

5. In a retort of the class described, the combination with the cylindrical vessel, A, and the partitions, C, D, E, therein, of the short permanent partition, H, the partition, G, having the opening, J, between the partitions, E, H, and terminating below the top of the latter, the radial partitions, M, M', open alternately at the bottom, and means for successively oxidizing and decalcifying a suitable liquid and at the same time passing it continuously around the retort; substantially as described.

6. In a retort of the class described, the combination with an outer wall, of a cylindrical partition forming a central supply-chamber, radial partitions extending from said cylindrical partition to the outer walls of the retort, and dividing the remainder of the retort into an oxidizing and a decalcifying chamber, said oxidizing and decalcifying chambers being crossed by various partitions extending part way up, said partitions being so arranged that the chambers formed by them open, one into another, alternately at the top and bottom, the alternate chambers being provided with injectors, these in the oxidizing-chamber being air-injectors, and these in the decalcifying-chamber being steam-injectors, the alternate ones of said short partitions being provided with deflectors so arranged that the liquid which is turned upward by the injector will be turned into the next compartment, suitable means of communication from the oxidizing-chamber to the central supply-chamber, from the central supply-chamber to the decalcifying-chamber, and from the decalcifying-chamber to the oxidizing-chamber; substantially as described.

7. In a retort of the class described, the combination with an outer wall, of a cylindrical partition forming a central supply-chamber, with radial partitions extending from said cylindrical partition to the walls of the retort and dividing the remainder of the retort into an oxidizing and a decalcifying chamber, said oxidizing and decalcifying chambers being crossed by various partitions extending part way up, said partitions being so arranged that the chambers formed by them open, one into another, alternately at the top and bottom, the last chamber of the oxidizing series opening at the top into the central supply-chamber, also at the top into the next oxidizing-chamber, said last chamber being adapted to serve as a settling-chamber for the liquid, suitable means of communication from the central supply-chamber to the lower part of the decalcifying-chamber and from the last chamber of the decalcifying series to the first chamber of the oxidizing series; substantially as described.

702,855. AUTOMATIC SKIMMING-REGULATOR FOR ICE-MAKING APPARATUS. ABRAHAM O. FRANK, Waynesboro, Pa., assignor to the Frick Company, Waynesboro, Pa., a Corporation of Pennsylvania. Filed Mar. 19, 1900. Serial No. 674,468. (No model.)

Claim.—1. A regulating device for the skating apparatus of an ice-making apparatus, which consists of a part of material adapted to be

quickly expanded and contracted by heat and cold, a connection between said part and the valve which controls the flow of water from the bell-tank, and means for connecting said part with an overflow from said bell-tank, substantially as set forth.

2. A regulating device for the skating apparatus of an ice-making plant, which consists in a contractible and expansible part connected with an overflow from the bell-tank, and also with a cold-water supply, and a connection between said part and the valve which controls the flow of water from said bell-tank, substantially as set forth.

3. The combination in an ice-making apparatus, of the bell-tank, the skin-dish, overflow-openings leading from one to the other, a discharge-pipe for the pure water leading from said bell-tank to the storage-tank, a valve therein for controlling the flow of water, another pipe leading from within said bell-tank the top of which is substantially on a level with the overflow-openings and the lower end of which discharges into the surface of a contractible and expansible part, and a connection between said part and said valve, substantially as set forth.

4. In an ice-making apparatus, the combination of the bell-tank, the pipe leading therefrom to the storage-tank, a second pipe leading therefrom through which an overflow is adapted to discharge connected to a contractible and expansible pipe, a lever pivoted to its lower end and hinged at one end to an adjacent point and at its other end connected by suitable connections for transmitting motion to the valve for controlling the flow of water from the bell-tank, substantially as set forth.

5. In an ice-making apparatus, the combination, of the bell-tank, the overflow-pipe 2, the part of pipe B of the character described, a lever hinged at one end to the post alongside the lower end of said part or pipe, pivoted to said lower end at a point between its ends, and connected by its other end and by suitable means to the operating-handle of the valve which controls the flow of water from the bell-tank, a weight being attached to said handle, and another weight of slightly greater gravity being attached to the other end of the lever connected with the pipe B, substantially as set forth.

6. In an ice-making apparatus, the combination, of the bell-tank, the skating apparatus, and the regulating device consisting of a part of contractible and expansible material located in the path of an overflow of hot water from said bell-tank and connected by suitable means to the means for controlling the outflow from the bell-tank, whereby its contraction and expansion caused by the intermittent flow of hot water therethrough will operate said means, substantially as set forth.

7. In an ice-making apparatus, the combination, of the bell-tank, the skating apparatus, the regulating device, a jointed lever mounted on a fixed pivot between its joint and one of its ends a connection to the regulating device joined thereto between its joint and its other end, a connection of suitable material running from the end of said part connected to the regulating device to the valve for controlling the flow from said bell-tank, a weight also attached to said end, a weight of less gravity attached to the operating-handle of said valve, a connection of similar material and length joined to the outer end of the other member of said lever and running through corresponding space and attached to a fixed point, and a weight of greater gravity than either of said other weights attached to the same end of said lever, substantially as set forth.

8. In an ice-making apparatus, the combination, of the bell-tank, the overflow-pipe 2, the regulating part B, the lever L pivoted to its lower end at a point between its ends, the jointed lever L' mounted at a point between its joint and one end on a fixed pivot, a link connecting the free end of said lever L to said lever L' at a point a distance from the joint equal to the distance from said joint to the pivot, a weight and connecting-wire attached to the other end of said member, said wire extending to the operating-handle of the valve which controls the flow from said bell-tank to which it is attached, a weight of less gravity also attached to said handle, another wire attached to the opposite end of said lever L', and running to correspond with the other, a weight of greater gravity than that on the other end attached to this end of said lever, the distance from the connection of said link with the one member to its end being the same as the distance from the pivot of the other member to its end, all substantially as described and for the purpose specified.

9. In an ice-making apparatus, the combination, of the bell-tank having overflow-openings at the skimming level, the skimming apparatus, the overflow-pipe extending up within said tank to a point substantially even with the skimming-discharge, and an adjustable tap thereon, whereby the extent of skimming may be regulated, and the apparatus adjusted to waste the least amount of good water possible, substantially as set forth.

10. The combination in an ice-making plant, the bell-tank having overflow-openings at the skimming level, the skimming apparatus, the overflow-pipe 2 connected with the regulating device and extending up within the tank to the skimming level, and a shell with openings around its bottom surrounding said pipe and extending to above its end in said tank, substantially as set forth.

11. The combination in an ice-making plant, of the bell-tank having

overflow-openings at the skimming level, the skimming apparatus, the regulating device arranged to be operated by an overflow from said tank, the overflow-pipe provided with an adjustable tap, the edge of which is normally at substantially the skimming level, a shell surrounding said overflow-pipe within said tank and extending to a point above the water-line and formed with openings around its lower end and at or near the bottom of said tank, substantially as set forth.

702,857. DENTAL FASTENING AND BRIDGEWORK. WILLIAM E. GRISWOLD, Denver, Colo., assignor to Griswold Dental Bridge Company, Denver, Colo., a Corporation of Colorado. Filed Apr. 6, 1901. Serial No. 64,960. (No model.)

Claim.—1. In dental bridgework, the combination of a spring-steel screw to be engaged the cap of a root, a spring-steel screw to the side of a crown, and complementary attaching parts on opposite ends of the saddle.

2. The combination of a dental fastening substantially U-shaped in elevation and having converging sides or wedge-shaped in cross-section, and a corresponding reverse cap or cover.

3. A spring-fastening device attached to the side of a crown and flaring outwardly, so that the complementary attaching parts may be forced down over the fastening device and be locked from any but a vertical movement.

4. A dental spring-fastening substantially U-shaped in elevation and having converging sides in cross-section, and having a locking element formed in its side.

5. The combination of a bent and flaring spring-fastening device, and a complementary cap or cover, both having interlocking ribs.

6. The combination of a bent and flaring spring-fastening device, a complementary reverse cap or cover, the cap or cover having an open bottom and all of its sides but one closed.

7. The combination of a saddle, a spring-fastening element soldered to the saddle and embedded in the material by which the teeth are fastened to the saddle, and a complementary part secured to the side of a crown or artificial tooth, and adapted to enter the spring-fastening element.

702,858. FIRE-ESCAPE. BENJAMIN F. HENNINGSEN and HENRY W. THOMPSON, Quincy, Ill. Filed Nov. 2, 1901. Serial No. 80,320. (No model.)

Claim.—1. A fire-escape comprising in combination a block having an opening therein, friction-drums arranged in said opening, brake-blocks bearing against the journals of the said friction-drums, regulating-crooks bearing against the said friction-drums, the intermeshing gears connected to the friction-drums, and an operating-handle connected to one of the said drums, substantially as described.

2. A fire-escape of the kind described, comprising in combination a block having an opening therein, friction-drums arranged in the said opening, friction-drums journaled in the said bearing-frames, the

brake-blocks and regulating-crooks, the intermeshing gears attached to the friction-drums, the operating-handle and the supporting-barrows attached to the block, substantially as described.

3. A fire-escape of the kind described, a block having an opening therein, and a vertical bar traversing the said opening, the slotted bearing-frames arranged in the said opening in the block, the friction-drums journaled in the said bearing-frames, the brake-blocks sliding in the said frames and bearing upon the journals of the friction-drums, the regulating-crooks passing through the ends of the block and bearing against the ends of the friction-drums, the intermeshing gears mounted upon the ends of the friction-drums, the operating crank-handle attached to one of the friction-drums, the supporting-barrows and floor-plates, all arranged to operate as shown and described.

702,859. LAND-PULVERIZER. EMMERSON HOWE, Omaha, N. Y. Filed July 17, 1901. Serial No. 63,066. (No model.)

Claim.—1. A trans member comprising the combination of a transverse member constructed to be pivotally connected to a shaft, and bearing two sheaves one mounted on each end thereof, a longitudinal member, and a pair of trans-rod connected at their extremities to the extremities of said longitudinal member and bearing intermediately on said sheaves, substantially as described.

2. The combination with the frame of the machine, bearing a shaft, of a pair of parallel trans members pivotally mounted on said shaft, each of said members comprising a transverse member pivoted on said shaft and bearing a sheave on each end, a longitudinal member, and a pair of trans-rod connected at their extremities to the extremities of said longitudinal member and bearing on said sheaves, a pulverizing-drum carried by said trans members, and means for adjusting said trans members at different heights, substantially as described.

3. The combination with the frame of the machine, of a shaft, of a pair of parallel trans members mounted on said shaft, each of said trans members comprising a transverse member pivoted on said shaft and bearing a sheave, a longitudinal member, and a pair of trans-rod connected at their extremities to the extremities of said longitudinal member and bearing intermediately on said sheaves, and a pulverizing-drum journaled in said longitudinal member, substantially as described.

702,860. VALVE FOR REVERSIBLE STEAM-ENGINE. AUGUST E. KOON, Martinsville, Ind. Filed May 16, 1901. Serial No. 60,344. (No model.)

Claim.—1. In a reversing-gear for steam-engines, the combination with the bearing-plate and valve-seat having aligning parts or openings upon opposite sides of a central longitudinal line, of a reversing plate arranged between the bearing-plate and valve-seat and having non-aligning openings or parts upon opposite sides of a central longitudinal line, said plate being movable horizontally for the purpose of bringing certain of its parts into register with the parts or openings in the bearing-plate and valve-seat, substantially as shown and described.

2. In a reversing-gear for steam-engines, the combination with a

bearing-plate and valve-seat having aligning ports or openings and arranged above a central partition in the steam-chest, of a reversing plate arranged between the bearing-plate and valve-seat and having ports or openings adapted to be alternately brought into register with the ports or openings of the valve-seat and bearing-plate, substantially as shown and described.

3. The combination with a cylinder, of a steam-chest and chest having a longitudinal partition provided with oppositely-inclined partitions upon its opposite sides, a bearing-plate having openings or ports therein, a valve-seat having openings or ports arranged in alignment with the openings or ports of the bearing-plate, and a reversing plate arranged to work between the bearing-plate and valve-seat and provided with non-aligning openings or ports, substantially as shown and described.

4. In a reversing-gear for steam-engines, the combination with the bearing-plate having steam inlet and exhaust ports or openings, of a valve-seat having inlet and exhaust openings upon opposite sides of a central longitudinal line adapted for alignment with the openings or ports of the bearing-plate, and the reversing plate having non-aligning inlet openings or ports, and an exhaust-part of a size to be continually in register with the exhaust ports or openings in the valve-seat and bearing-plate, substantially as shown and described.

5. The combination with the cylinder and steam-chest of a longitudinal partition arranged in the said steam-chest, the oppositely-inclined partitions arranged upon opposite sides of the longitudinal partition, the bearing-plate and valve-seat having aligning ports or openings, the reversing plate sliding between the bearing-plate and valve-seat and having non-aligning inlet openings or ports and a continuously-aligning exhaust-part, and means for shifting or reversing the said plate, substantially as described.

702,861. TOL. WILLIAM P. LYLE, Philadelphia, Pa. Filed Sept. 28, 1901. Serial No. 78,924. (No model.)

Claim.—1. A toy comprising a receptacle to be held in and moved by the hand, a movable pellet therein, a tube adapted to engage said pellet when the latter is in its proper position but serving by its own movement to obstruct the movement of the pellet to said position, and a stopper having a projecting spindle serving as a rigid guide for the tube and restricting the movement of the latter to a plane transverse to that of the movable pellet, substantially as specified.

2. A toy comprising a receptacle to be held in and moved by the hand, a movable pellet contained within said receptacle, and a secondary movable element guided in the receptacle and adapted to engage said pellet when the latter occupies its proper position in the receptacle, but serving by its own movement to obstruct such movement of the pellet, the portion of the receptacle over which the pellet moves being convex or beveled, substantially as specified.

3. A toy comprising a receptacle to be held in and moved by the hand, a movable pellet contained in said receptacle, and a secondary movable element contained in the receptacle and adapted to engage the pellet when the latter is in proper position but curving normally to obstruct the proper movement of the pellet, and a rigid guide on the receptacle whereby the said secondary element can move only in a plane transverse to that of the movable pellet, substantially as specified.

4. A toy comprising a receptacle to be held in and moved by the hand, a pellet movable therein, a secondary movable element adapted to engage said pellet when the latter is in its proper position, but serving by its own movement to obstruct the movement of the pellet to said position, and a stopper having a projecting spindle serving as a guide for said secondary movable element, substantially as specified.

5. A toy comprising a receptacle to be held in and moved by the hand, a pellet movable therein, a secondary movable element adapted to engage said pellet when the latter is in its proper position, but serving by

its own movement to obstruct the movement of the pellet to said position, and a stopper having a projecting spindle serving as a guide for said secondary movable element, and also having a shoulder for restricting the movement of said element in one direction, substantially as specified.

702,862. NICHOLS-HUFFORD. ERIC NICHOLS, Part Arthur, Tex. Filed May 4, 1902. Serial No. 10,490. (No model.)

Claim.—A bicycle-support comprising in combination the barrel 1, the upper end of which has a clamp attached thereto, said clamp comprising the semicylindrical members 2 and 3, hinged together at one side, a swinging nut 4, the lip 5 to which the nut is secured, said lip depending from the front edge of the member 2, the free end being adapted to move in a notch 6 produced in the flange 7, said flange projecting forwardly from the free end of the member 3; the rod 8 having a head 10 and flange 11, the set-screw 12, all of said parts being arranged and operating as set forth.

702,868. HERR. JOHN R. BERNHART, St. Louis, Mo. Filed Apr. 28, 1901. Serial No. 54,106. (No model.)

Claim.—1. The herein-described sign consisting of the bottom having a zigzag rear edge and the segmental front edge, sides D secured to the outer rear edge of the bottom and extending upward therefrom, a metallic frame provided with a large rectangular opening and having turn-over edges upon its sides, said frame having its lower edge and turn-over edges engaging to the segmental front edge of the bottom and the front edges of the sides and providing a space between the edges of the side and turn-over edges, a convex sheet of glass fitting upon the bottom, and in said space and back of the opening in the frame, back sheet E secured to the rear edge of the bottom and the rear edge of the sides, a top fitting upon said frame sides and sheet consisting of the base, the downwardly-extending edges to surround said above-mentioned parts, and an illuminator carried by the lower side of the top.

2. A sign consisting of a bottom having a zigzag rear edge and a segmental front edge, sides secured to and extending upward from the outer edges of the rear, two back sheets secured to and extending upward from the remainder of the bottom and secured to the sides, said sides and back being the same height, a metal plate of substantially the same shape as the bottom, overlapping edges or flanges carried by said plate and adapted to surround or overlap the upper ends of the back and sides to form a top for the sign, a metal frame having curved upper and lower pieces and flanged sides engaging the bottom and sides, a curved sheet of transparent material carrying a sign held in place by the metallic frame, a reflector secured to the under side of the top, and an illuminator carried by the reflector.

702,864. METHOD OF PREPARING SKINS FOR TANNING. WASHINGTON L. ALDER, Buffalo, N. Y., assignor of one-half to Schoellkopf & Company, Buffalo, N. Y., a firm. Filed Mar. 28, 1901. Serial No. 68,810. (No specimens.)

Claim.—1. The herein-described method of tanning skins preparatory to tanning which consists in steeping the skins in a watery solution of sulfid of sodium, bicarbonate of soda and borax, then agitating the skins in a watery solution of sulfid of sodium, bicarbonate of soda, borax and caustic soda, and then agitating the skins in a watery solution of bicarbonate of soda and borax, substantially as set forth.

2. In the art of cleaning skins preparatory to tanning, the method of preparing the skins for treatment with the main cleaning solution

which consists in steeping the skins in a watery solution of sulfid of sodium, bicarbonate of soda and borax, substantially as set forth.

3. In the art of cleaning skins preparatory to tanning, the method of treating the skins with a main cleaning solution which consists of a watery solution of sulfid of sodium, bicarbonate of soda, borax, and caustic soda, substantially as set forth.

702,865. RY-MENSH GUARD. DANIEL W. RYMER, Muffin, Ind., assignor of one-half to Lewis L. De Haven, Muffin, Ind. Filed Dec. 27, 1901. Serial No. 87,498. (No model.)

Claim.—1. A protector for the projecting portion of a fastening applied to a rotating part, the same comprising a band to be fitted to the rotating part, and a guard spanning the projecting end of the fastening and having its end-portion detachably connected to the band at opposite sides of the fastening by means of a slip-joint, substantially as set forth.

2. A protector for the projecting portion of a fastening applied to a rotating part, the same comprising a band having openings at opposite points, and a guard for spanning the projecting portion of the fastening and having its end-portion passed through the said openings and held between the band and the part to which the band is fitted, substantially as specified.

3. A protector for the projecting portion of a fastening applied to a rotating part, the same comprising a split band adapted to have its end-portion overlapped and formed with openings to receive the projecting portion of the fastening, and a guard of approximately U form for spanning the fastening and having its end-portion fitted to the band at opposite sides of the said fastening, substantially as set forth.

702,866. RASOR-STROP. WILLIAM O. BRITTON, Triston, E. J., assignor to Joseph R. Turvey and Lewis R. Turvey, composing firm of J. R. Turvey & Co., Worcester, Mass. Filed Sept. 11, 1901. Serial No. 70,012. (No model.)

Claim.—1. A swing-strop for rasors having a handle portion provided with an open-ended pocket to receive and hold a rasor or other toilet article.

2. A swing-strop for rasors comprising flexible stopping members and a handle portion, said handle portion being provided with an open-ended pocket on each side to receive and hold a rasor or other toilet article.

3. A swing-strop for rasors comprising flexible stopping members, and a handle portion formed of strips secured along their sides and outer ends to said stopping members, said strips being left unsecured at their inner ends so as to form one or more open-ended pockets to receive and hold rasors or other toilet articles.

4. A swing-strop for rasors comprising flexible stopping members and a handle portion, said handle portion being formed of strips attached along their sides and outer ends to the opposite sides of said stopping members, but unsecured at their inner ends so as to form an open-ended

pocket on each side of said handle portion to receive and hold rasors or other toilet articles, said flexible stopping members being adapted to be folded about said handle portion as a protection to the articles therein.

5. A swing-strop for rasors, comprising a flexible stopping member and a handle portion therefor, said handle portion being formed of a strip attached along its sides and outer end to said stopping member, but being unsecured at its inner end so as to form an open-ended pocket to receive and hold a rasor or other toilet article, said flexible stopping member being adapted to be folded about the said handle portion as a protection to the article therein.

702,867. PROCESS OF STRETCHING LEATHER. JOHN CALDWELL, Minneapolis, Minn. Filed Mar. 18, 1901. Serial No. 61,594. (No specimens.)

Claim.—1. The herein-described method of preparing skins, centers, backs, and similar divisions of leather for bolting, consisting in first stretching longitudinally the outer portions of such divisions of leather to a degree sufficient to make them substantially as unyielding as the firmer portions, and then stretching all portions longitudinally to an equal degree.

2. The herein-described method of preparing leather for bolting, consisting in successively and unequally stretching in longitudinal direction contiguous portions of a side, center, back, or similar division of leather that differ in degrees of firmness, beginning with the softest longitudinal portion and stretching that and then each succeeding, together with each preceding, portion until each other portion is stretched sufficiently to make it substantially equal to the adjacent firmer portion in ability to resist tension, and continuing the operation until all portions are stretched sufficiently to make them substantially equal in ability to withstand tension.

3. The herein-described method of preparing leather for bolting, consisting in first stretching longitudinally the softest portion of a side, center, back, or similar division of leather until it is approximately equal to an adjoining firmer portion in ability to resist tension; next stretching said two portions in like manner until they are approximately equal to another adjoining portion in ability to resist tension; and so on with successive portions until all portions are stretched sufficiently to make them substantially equal to the hardest portion in ability to withstand tension.

4. The herein-described method of preparing leather for bolting, consisting in cutting hides into backs, centers, and sides, or other suitable divisions, saturating such divisions with water and green, partially drying them, and then stretching longitudinally the softest longitudinal portion of one of such bodies of leather until its ability to resist tension is approximately equal to a portion contiguous to it; next stretching said two portions until their ability to resist tension is approximately equal to another contiguous portion; and so on until all portions are stretched sufficiently to make them substantially equal to the hardest portion in ability to resist tension.

702,868. SCRAPER FOR ROLLERS. RICHARD CLARKE, Liverpool, England, assignor to the Liverpool Milk Company, Limited, Liverpool, England. Filed July 11, 1900. Removed Apr. 22, 1902. Serial No. 104,430. (No model.)

Claim.—1. A scraper for rollers, wheels, and similar rotary bodies, consisting of a single blade centrally pivoted on a carrier-bracket which is freely mounted upon a rod parallel with the axis of the rotary body, substantially as described.

2. A scraper for rollers, wheels, and similar rotary bodies, consisting of a plurality of sections, each of which comprises a blade centrally pivoted upon a carrier-bracket, which is freely mounted upon a rod fixed parallel with the axis of the rotary body, substantially as described.

3. A scraper for rollers, wheels, and similar rotary bodies, consisting of a plurality of sections each of which comprises a blade centrally pivoted upon a carrier-bracket, the sections being mounted successively upon a plurality of rods parallel with the axis of the rotary body, substantially as described.

4. In combination with a roller-scraper, a carrier-bracket constructed with a hole to fit upon a supporting-rod freely, and provided with means whereby the scraper can be centrally pivoted thereto at right angles to the said hole, substantially as described.

702,869. AIR-TUBE FOR PNEUMATIC TIRES. ARTHUR T. COLLIER, St. Albans, England, assignor of one-half to Edgar Oliver Goss and Arnold Hewarty Williams, London, England. Filed Apr. 15, 1902. Serial No. 105,040. (No specimen.)

Claim.—1. In an air-tube for a pneumatic tire, the combination of an inner layer of india-rubber, cured with an antimony compound and an outer layer cured with sulfur, substantially as, and for the purpose specified.

2. In an air-tube for a pneumatic tire, the combination of an inner layer of india-rubber cured with an antimony compound, an outer layer cured with sulfur, and an intermediate layer acted upon by the curing agents from the said inner and outer layers, substantially as, and for the purpose hereinbefore described.

702,870. HAT-BRIM TRIMMER. JAMES R. CRIVETT, Norwalk, and HARRIS MORSEBORN, East Norwalk, Conn. Filed Nov. 12, 1901. Serial No. 91,322. (No model.)

Claim.—1. In a machine of the character described the combination with means for holding a hat-body, means for clamping the edge of the brim externally, a rotating planing-tool, a swinging head by which the planing-tool is carried, means for causing the planing-tool to describe an oval when the head is swung around and means for causing the planing-tool to rise from end to side and then descend from side to end of a hat-brim during each half-rotation.

2. In a machine for trimming curled hat-brims, the combination with a stationary external brim-clamp, of a rotating planing-tool, and means for causing said tool to describe an oval.

3. In a machine for trimming curled hat-brims, the combination with a stationary external brim-clamp, of a rotating planing-tool, means for causing said tool to describe an oval and means for causing said tool to rise and fall respectively at the sides and ends of a hat-brim.

ing said tool to describe an oval and means for causing said tool to rise and fall respectively at the sides and ends of a hat-brim.

4. In a machine for trimming curled hat-brims, the combination with a rotating planing-tool, means for causing said tool to describe an oval and means for causing said tool to rise and fall at the sides and ends respectively of a hat-brim, of a stationary clamp adapted to engage the hat-brim externally while the inner edge of the brim is being acted on by the planing-tool.

5. The brim-clamp E comprising movable side plates 21 and quarter-plates 22, and means for independently moving said side plates and said quarter-plates to grip a brim.

6. The brim-clamp E comprising side plates 21, quarter-plates 22, and independently-movable rings to which said side plates and said quarter-plates are connected respectively.

7. The brim-clamp E comprising a brim-plate having slots 18, slides in said slots, side plates and quarter-plates adjustably secured to said slides, independently-movable rings and links connecting the blocks carrying the side plates to one ring and the blocks carrying the quarter-plates to the other ring.

8. The combination with a fixed standard B, a hat-holder and a pattern-plate, of a track-plate highest at the sides and lowest at the ends, for the purpose set forth, a swinging head movable around the standard, a vertically-movable standard carried by said head and engaging the track-plate and a horizontally-movable body carried by said standard and engaging the pattern-plate.

9. The combination with a standard B, a hat-holder and a brim-clamp adapted to engage the brim externally, of a horizontal pattern-plate, a track-plate made highest at the sides and lowest at the ends, for the purpose set forth, and a swinging head movable around the standard and carrying a vertically-movable standard 54 having a roller engaging the track-plate, said standard carrying a horizontally-movable body having a roller engaging the pattern-plate.

10. The combination with a standard B, a hat-holder and a brim-plate having slots 18, of slides 19 lying in the slots, side and quarter plates carried by said slides and adapted to engage the brim externally, oscillating rings upon the standard, links connecting the side plates to one ring and the quarter-plates to the other ring, a pattern-plate carried by the standard, a track-plate highest at the sides and lowest at the ends and a swinging head carrying a vertically-movable standard 54 engaging the track-plate, said standard carrying a horizontally-movable body engaging the pattern-plate.

11. In a machine of the character described the combination with a track-plate highest at the sides and lowest at the ends and a horizontal cam-plate, of a swinging head carrying a vertically-movable standard 54 engaging the track-plate, said standard carrying a horizontally-movable body engaging the pattern-plate.

12. In a machine of the character described the combination with a pattern-plate and a track-plate lowest at the ends and highest at the sides, of a swinging head comprising a housing 55, a vertically-movable head in said housing which engages the track-plate, a housing 49 carried by the standard, and a spring-controlled body adapted to slide in housing 49 and carrying a roller engaging the pattern-plate.

13. The combination with a hat-holder, an external brim-clamp, a pattern-plate and a track-plate lowest at the ends and highest at the sides, of a swinging head, a vertically-movable standard carried by said head

and engaging the track-plate, a spring-controlled body carried by said standard and engaging the pattern-plate and a rotating planing-tool carried by the body and adapted to act on the inner edge of a hat-brim.

14. The combination with a hat-holder, an external brim-clamp, a pattern-plate and a track-plate lowest at the ends and highest at the sides, of a swinging head, a vertically-movable standard carried by said head and engaging the track-plate, a spring-controlled body carried by said standard and engaging the pattern-plate, a downwardly and backwardly inclined plate adjustably secured in the body and a rotating planing-tool journaled in said carrier at an incline to the vertical plane.

15. The combination with a standard B, a hat-holder and a pattern-plate lying in the horizontal plane, of a track-plate highest at the sides and lowest at the ends, for the purpose set forth, and a swinging head carrying a vertically-movable standard 54 having a roller engaging the track-plate, said standard carrying a horizontally-movable body having a roller engaging the pattern-plate.

16. In a machine for trimming curled hat-brims, the combination with an external brim-clamp, of a rotating planing-tool and means for moving said tool around the hat and to cause it to rise and fall respectively at the sides and ends of a hat-brim.

17. In a machine for trimming curled hat-brims, the combination with an external brim-clamp, of a rotating planing-tool journaled in a plate at an incline to the vertical plane, and means for moving said tool around the hat and to cause it to rise and fall respectively at the sides and ends of a hat-brim.

18. The combination with a hat-holder, an external brim-clamp, a pattern-plate and a track-plate lowest at the ends and highest at the sides, of a swinging head, a vertically-movable standard carried by said head and engaging the track-plate, a spring-controlled body carried by said standard and engaging the pattern-plate, a plate 40 adjustably secured in said body, a swinging carrier pivoted to said plate and a rotating planing-tool journaled in the carrier.

19. In a machine of the character described the combination with a hat-holder and an external brim-clamp, of a swinging head, a rotating planing-tool carried thereby and means for causing said tool to describe an oval.

20. In a machine of the character described the combination with a hat-holder and an external brim-clamp, of a swinging head, a rotating planing-tool carried thereby, and means for causing said tool to rise and fall respectively at the sides and ends of a hat-brim.

21. In a machine of the character described the combination with a hat-holder and an external brim-clamp, of a swinging head and a rotating planing-tool carried by said head and journaled at an incline to the vertical plane.

22. The combination with a hat-holder, an external brim-clamp, a pattern-plate and a track-plate lowest at the ends and highest at the sides, of a swinging head, a vertically-movable standard carried by said head and engaging the track-plate, a spring-controlled body carried by said standard and engaging the pattern-plate, a carrier adjustably secured in the body and a planing-tool journaled in said carrier at an incline in the vertical plane.

702,871. SECURING DEVICE FOR DENTAL BRIDGEWORK. WILLIAM H. CHAPMAN, Denver, Colo., assignor, by direct and several assignments, to Griswold Dental Bridge Company, Denver, Colo., a Corporation of Colorado. Filed Oct. 12, 1900. Removed May 12, 1902. Serial No. 125,061. (No model.)

Claim.—1. A spring-actuated fastener for dental use, having a series of spring-arms and a reducing-ring applied to the arms to converge their ends and furnish a means of adjustment in a root or crown.

2. A spring-actuated fastener for dental use, having a series of spring-arms, a ring controlling the arms and set upon the arms at the same angle as the base of the root or crown to which it is to be applied.

3. The combination in a dental securing device, of a spring-actuated fastener carrying a reducing-ring and a complementary cap and base-ring.

4. In removable bridge-work, the combination of posterior and anterior attaching devices, one a solid steel fixed in an artificial tooth, the other a spring-actuated secured in a root or crown, and a middle having a metal sheath perforated to take over the solid steel as a pivot and to receive the spring-actuated to secure the middle.

702,872. FLUID-PRESSURE REGULATOR. PAUL H. HANSEN, Tempe, Ariz., assignor of one-half to John S. Sappington, Tempe, Ariz. Filed Dec. 22, 1901. Serial No. 94,061. (No model.)

Claim.—1. In a fluid-pressure regulator, the combination with a

fluid-supply apparatus having a fluid-supply valve for the motive agent, of a valve-controlling device comprising a ratchet-wheel mounted upon the valve-stem, a movable pawl-carrier operated from a moving part of the engine or motor, a pawl supported upon the carrier, and an electrical pawl-cutting device also carried by the carrier, and a pressure-operated circuit-controller.

2. In a fluid-pressure regulator, the combination with a fluid-supply apparatus having a supply-valve for the motive agent, of a valve-controlling device comprising a double-ratchet wheel mounted upon the valve-stem, a movable pawl-carrier operated from a moving part of the engine or motor, a normally inactive double-acting pawl mounted upon the carrier, separate setting-magnets co-springing with the pawl and also mounted upon the carrier, and a pressure-operated circuit-controller.

3. In a fluid-pressure regulator, the combination with a fluid-supply apparatus having a supply-valve for the motive agent, of a valve-controlling device comprising a double-ratchet wheel mounted upon the valve-stem, a pendulum swinging carrier pivotally supported and operated from a moving part of the engine or motor, an approximately Y-shaped actuating-pawl pivotally mounted upon the carrier and having a pendulous armature-stem portion, pawl-cutting magnets mounted upon the carrier respectively at opposite sides of the said armature-stem portion of the pawl, and a pressure-operated circuit-controller in circuit with said magnets.

4. In a fluid-pressure regulator, the combination with a fluid-supply apparatus having a supply-valve for the motive agent, of a valve-controlling device including pawl-and-ratchet members and pawl-cutting magnets, and a pressure-operated circuit-controller consisting of a pressure-gauge having a pointer and spaced contacts disposed respectively at opposite sides of the pointer, the latter and said contacts being included in circuit with a source of electrical energy and said magnets.

5. In a fluid-pressure regulator, the combination with a fluid-supply apparatus having a supply-valve for the motive agent, of a valve-controlling device including pawl-and-ratchet members and separate setting-magnets for the pawl member, and a pressure-operated circuit-controller consisting of a pressure-gauge having a pointer and separate spaced contacts for the separate magnets, said pointer and contacts constituting a circuit-clear and being included in an electrical circuit with a source of energy and said magnets.

6. In a fluid-pressure regulator, the combination with a fluid-supply apparatus having a supply-valve for the motive agent, of a valve-controlling device including electromagnets operating means, and a pressure-operated circuit-controller in circuit with said electromagnets operating means and consisting of a pressure-gauge having a movable adjustable rim, and a pair of spaced contacts carried by said rim and extending over the dial respectively at opposite sides of the indicating end of the pointer, the latter and the said contacts being included in the electrical circuit.

702,873. GAS-BURNER. THOMAS BALLARD, New York, N. Y., assignor to Blawie & Ballant, New York, N. Y. Filed Jan. 24, 1901. Removed Dec. 2, 1901. Serial No. 84,784. (No model.)

Claim.—1. A gas-burner, having a trough-shaped body portion, the upper edges of which are turned inward at an incline, a burner-plate having gas-outlet notches in its opposite edges, and a control line of gas-outlet openings, the edges of said plate being inclined or beveled to engage tightly against the inclined inner surfaces of said side portions of the body, and means for fastening the plate in position, substantially as specified.

adapted to be arranged in the fire-box of a stove and communicating at its upper end with the off-take-flue of said stove and at its lower end with the atmosphere, a burner-tube arranged within said casing and comprising a vertical tube open at its opposite ends, means for normally closing the upper end of said tube, a generating-chamber in said casing and inclosing the burner-tube, said chamber being open at its bottom only, and means for feeding liquid fuel to said burner intermediate its ends, substantially as described.

2. In a liquid-fuel burner, the combination with a casing adapted to be arranged within the fire-box of a stove and communicating at its upper end with the off-take-flue of said stove, a vertical plate closing the front of the casing, said casing being provided at its lower end with a trough and having an aperture communicating with the atmosphere, a burner-tube arranged within said casing and consisting of a vertically-arranged tube open at its opposite ends, a vertical generating-chamber in said casing and inclosing the burner-tube, said chamber being open at its bottom only, and means for feeding liquid fuel to said burner-tube, substantially as described.

3. In a liquid-fuel burner, the combination with a hollow casing adapted to be arranged within the fire-box of a stove and communicating at its upper end with the off-take-flue of said stove, said casing being provided at its lower end with a trough, a burner-tube arranged within the casing and comprising a vertically-disposed tube open at its opposite ends, means for supplying liquid fuel to said burner-tube, and a generating-chamber removably arranged in said casing surrounding said burner-tube and opening at its lower end into said trough, the top of the generating-chamber resting on and closing the upper end of the burner-tube, substantially as described.

4. In a liquid-fuel burner, the combination with a hollow casing adapted to be arranged within the fire-box of a stove and communicating at its upper end with the off-take-flue of said stove, said casing being provided at its lower end with a trough having an aperture communicating with the atmosphere of a burner-tube arranged within said casing, means for supplying liquid fuel to the burner-tube, and a generating-chamber surrounding said burner-tube and opening at its lower end into said trough, said tube being arranged to discharge the liquid fuel downwardly through said generating-chamber, substantially as described.

5. In a liquid-fuel burner, the combination with a hollow casing adapted to be arranged within the fire-box of a stove and communicating at its upper end with the off-take-flue of said stove, said casing being provided at its lower end with a trough communicating with the atmosphere, a burner-tube arranged within said casing and comprising a vertically-disposed tube open at its opposite ends, a generating-chamber inclosing said burner-tube and covering the upper open end of the said burner-tube said generating-chamber terminating at its lower end above the bottom of said trough, and means for supplying liquid fuel to said burner-tube, substantially as described.

6. In a liquid-fuel burner, the combination with a casing adapted to be arranged within the fire-box of a stove and communicating at its upper end with the off-take-flue of said stove, a vertical plate forming the front of the casing, said casing being provided at its lower end with a trough and having an aperture communicating with the atmosphere, a burner-tube arranged within said casing and comprising a vertically-arranged tube, means for feeding liquid fuel to the burner-tube, a generating-chamber inclosing said burner-tube and a pin arranged beneath the burner-tube and extending transversely through the generating-chamber between the top and bottom of the latter, substantially as described.

7. In a liquid-fuel burner, the combination with a casing adapted to be arranged within the fire-box of a stove and communicating at its upper end with the off-take-flue of said stove, an impervious vertical plate closing the front of the casing, and provided on its inner side with a rectangular base, said casing being provided at its lower end with a trough and having an aperture communicating with the atmosphere, a burner-tube arranged within said casing and consisting of a vertically-arranged tube open at its lower end, a vertical generating-chamber fitted in such casing over the said rectangular base and inclosing the burner-tube, said chamber

being open at its bottom only, and means for feeding liquid fuel to said burner, substantially as described.

702,881. CONCRETE-MIXING MACHINE. CARL OTTE, Lindström, Minn. Filed Mar. 15, 1901. Serial No. 61,898. (No model.)

Claim.—1. A machine of the class set forth consisting in combination with a mixing-receptacle having outer and inner walls, a pair of mixing-blades facing said outer and inner walls, so as to turn the contents of the receptacle back and forth at each revolution, a vertical shaft passing centrally through said receptacle by which said blades are revolved, means for driving the shaft so as to revolve the blades between said walls, and a system of outlets in the base of said receptacle, adapted to empty the same.

2. A concrete-mixing machine consisting in combination with a mixing-receptacle having circular outer and conical inner walls, of a vertical shaft passing through the center of said receptacle, a pair of curved mixing-blades facing said outer and inner walls, adapted to turn the contents of said receptacle back and forth at each revolution and carried by said shaft, means for rotating said blades by said shaft, a system of outlets in the base of said receptacle, through which the concrete may be emptied, and a system of levers and doors, by which said outlets may be opened and closed.

3. A machine of the class set forth consisting in combination, of a mixing-receptacle having outer and inner walls, a vertical shaft passing through the center of said receptacle, a pair of mixing-blades carried by said shaft and adapted to turn the contents of the receptacle back and forth at each revolution, means for rotating said blades by said shaft, a plurality of outlets in the base of the receptacle, a system of doors in said outlets and hand-levers for opening and closing said doors, measuring-buckets pivoted on said receptacle for the cement, sand, &c., to be used for the concrete, and a system of catches for holding said buckets in normal position, said buckets adapted, when released from said catches, to tilt down so as to empty into said receptacle.

4. A concrete-mixing machine, consisting in combination with a mixing-receptacle, having circular outer and conical inner walls, of a vertical shaft passing centrally through said receptacle, a pair of curved mixing-blades positioned in diametrical alignment between said walls and carried by said shaft, means for revolving said blades between said walls, and an outlet in the base of said receptacle, adapted to empty the same.

5. A concrete-mixing machine, consisting in combination with a mixing-receptacle, having circular outer and conical inner walls, of a vertical shaft, passing through the center of said receptacle, a pair of curved mixing-blades facing said outer and inner walls within said receptacle and carried by said shaft, means for rotating said blades by said shaft, an outlet in said receptacle through which the concrete may be emptied, measuring-buckets journaled on said receptacle, for the cement, sand, &c., to be used for the concrete, and means for locking said buckets in normal position.

702,882. CARTRIDGE-CLIP. EDWARD C. PARKHURST, Hartford, Conn., assignor, by direct and mesne assignments, to the Lee Arms Company, Hartford, Conn., a Corporation of Connecticut, and Connecticut Trust and Safe Deposit Company, Hartford, Conn., a Corporation of Connecticut. Filed June 9, 1897. Serial No. 640,081. (No model.)

Claim.—1. The herein-described cartridge-clip for cartridge-clips, consisting of a resilient locking member having oppositely-inclined faces

as opposite ends, respectively thereof, and also having a laterally-projecting lever or actuator located intermediate the two inclined faces.

2. A cartridge-clip consisting of a clip-body having a cartridge-head-receiving channel, and a resilient cartridge-locker supported on the clip-body and having oppositely-inclined locking-faces at opposite ends, respectively thereof, normally projecting inward and over the opposite ends of the channel, and also having one or more levers or actuators intermediate said locking-faces.

3. In a cartridge-clip, the combination, with a clip-body having a longitudinal cartridge-head-receiving channel, of a cartridge-locker supported for movement relatively to the clip-body and having inclined locking-faces adapted for engaging and releasing the cartridges; and a locker-actuator operatively connected to said locker intermediate the ends thereof and adapted for moving said locker.

4. The combination, with a clip-body having a channel longitudinally thereof, of a cartridge-locker disposed longitudinally of the clip-body in the plane of the head-flare of the cartridges and movably supported on the clip-body to be shifted transversely thereof and having oppositely-inclined locking-faces, one at each end thereof, adapted for engaging and releasing the heads of the terminal cartridges.

5. A cartridge-locker for clips of the class described comprising a longitudinal body portion, inclined locking-faces at the ends thereof for engaging the heads of the cartridges, and a locker-actuator intermediate the ends thereof adapted to actuate the said locker upon the insertion of the clip into the magazine of a gun.

6. A cartridge-clip having a clip-body formed with a longitudinal cartridge-head-receiving channel, a cartridge-locker applied to the said clip-body and formed with resilient ends, which terminate in lateral projections including oppositely-inclined locking-faces which crowd the cartridges in the clip-body together; and means located upon the said locker for mechanical engagement when the cartridge-clip is introduced into a gun, whereby the cartridge-clip is released from the charge of cartridges in the clip-body.

7. In a cartridge-clip, the combination with a clip-body having a longitudinal cartridge-head-receiving channel, of a cartridge-locker supported for movement with relation to the clip-body; inclined locking-faces on the respective ends of the locker, adapted for engaging and releasing the cartridges; and a locker-actuator operatively connected to said locker for actuating the locker upon the insertion of the clip into the magazine of a gun.

8. A cartridge-clip of size and proportions to fit a passage in a chamber of a magazine small-arm, said clip having a channel for the reception of the cartridges, and being provided with a resilient incline at each of its ends, the inclines bearing against the terminal cartridges and serving to force the cartridges together in the channel of the clip, to form a compact column.

9. A cartridge-clip of size and proportions to fit a passage in a chamber of a magazine small-arm, said clip having a channel for the reception of the cartridges, and being provided with a resilient incline at each of its ends, the inclines bearing against the terminal cartridges and serving to force the cartridges together in the channel of the clip to form a compact column, and each incline terminating in a projection located at an angle to said incline, said projections serving to aid the inclines in retaining the cartridges within the channel of the clip.

702,888. SAFE. CHARLES V. FENNER, Chicago, Ill., assignor of two-thirds to Joseph H. Dodson and Louis S. McElhin, Chicago, Ill. Filed Oct. 28, 1901. Serial No. 86,074. (No model.)

Claim.—1. In a safe, the combination of an outer shell or casing consisting of a circular or tubular body or wall provided on one side with a flat seating or supporting face, a closed end head or wall and an end flange forming an open end for the shell or casing, an inner shell or casing consisting of a circular or tubular body or wall, a closed end head or wall, a turned end flange and rim forming an open end for the shell or casing, and a door hinged at one side to the end flange of the outer shell

or casing and having a circumferential wall or rim fitting the open end of the outer and inner shells or casings, substantially as described.

2. In a safe, the combination of an outer shell or casing having a circular or tubular body or wall with a neck or base, a closed end head or wall and an end flange inwardly turned forming an open end for the shell or casing and all made integral, an inner shell or casing having a circular or tubular body or wall, a closed end head or wall and an end flange and rim forming an open end for the shell or casing and all made integral, a door having an outer plate or wall and an inner plate or wall with a circumferential stopped wall and rim between them fitting the open ends of the outer and inner shells or casings, and a hinge for the door to the open end of the shell or casing, substantially as described.

3. In a safe, the combination of an outer shell or casing, an inner shell or casing, a base for the outer shell or casing and on which the safe is supported, a counter-rim in the bottom of the inner shell or casing, and a bolt having its nut or head end entered into the counter-rim of the inner shell or casing and having its body passing through the wall of the counter-rim and the base for fixedly securing the safe in position, substantially as described.

4. In a safe, the combination of an outer shell or casing having a closed end wall, an inner shell or casing having a closed end wall, a base for the outer shell or casing on which the safe is supported, a counter-rim in the closed end wall of the inner shell or casing, a counter-rim in the bottom of the inner shell or casing, a bolt having its nut or head end entered into the counter-rim of the end wall of the inner shell or casing for the stem to pass through the wall of the counter-rim and the end wall of the outer shell or casing, and a bolt having its nut or head end entered into the counter-rim in the bottom of the inner shell or casing for its stem to pass through the wall of the counter-rim and the base and securely fasten the safe in a fixed position, substantially as described.

702,884. WOOD-SAW. WILLIAM H. PERRY, Fairfield, Iowa. Filed Oct. 19, 1900. Serial No. 32,610. (No model.)

Claim.—1. In wood-saws, the combination of a main frame, a rocking frame hinged at its lower end to said main frame, and at its upper end carrying a saw-mandrel, a hand-bail secured to the upper end of the rocking frame and passing across from one side to the other above said mandrel, and a foot-lever to assist in moving said rocking frame; the connection of said hand-bail and foot-lever being such that the operative movement of the one will be contrary to that of the other, whereby the reaction of the power to operate the one will assist in operating the other.

2. In wood-saws, the combination of a main frame, a rocking frame pivoted at its lower end to said main frame and having a hand-bail at its upper end and a cross-bar near its lower end, a horizontally-projecting arm secured to said cross-bar a foot-lever pivoted to the lower end of the main frame and a bar pivotally connecting together the free end of the arm and the inner end of the foot-lever, the operative movements of the hand-bail and foot-lever being contrary to each other, whereby the reaction of the power to operate the one will assist in operating the other, substantially as described.

3. In wood-saws, the combination of a main frame a rocking frame hinged at its lower end to said main frame, and having a hand-bail at its upper end to give it movement in both directions, a foot-lever secured to said rocking frame to give it movement in one direction and a spring to give it movement in the other direction, the spring being adapted to assist the return movement of the hand-bail, and the reaction of the power applied to the foot-lever to assist the forward movement of said bail, substantially as described.

4. The combination of a main frame, a rocking frame pivoted at its lower end to said main frame and having a cross-bar near its lower end, a horizontally-projecting arm secured to said cross-bar, a foot-lever pivoted to the lower part of the main frame, and a connecting-bar, hinged at one end to the inner end of said foot-lever, and at the other end to the end of said arm, substantially as described.

702,885. DRILL-GRINDING MACHINE. CORNEL RICHARDS,
Grand Rapids, Mich., assignor to Wheaton and Norman Company,
Grand Rapids, Mich. Filed Jan. 23, 1902. Serial No. 90,800. (No
model.)

Claim.—1. In a drill-grinder, a V-shaped holder; an adjustable slide B, in suitable ways on the front of the holder retained in position by a curved spring c; a drill lip-rest O adjustably clamped to the slide B by suitable clips D; a suitable handle connected to the slide for adjusting the same, cooperating for the purpose specified.

2. In a drill-grinder, a V-shaped holder; an adjustable slide B, in suitable ways on the front of the holder retained in position by a curved spring c; a drill lip-rest secured to the said slide; a suitable handle connected to the slide for adjusting the same, cooperating for the purpose specified.

3. In a drill-grinder, a V-shaped holder; an adjustable slide, in suitable ways on the front of the holder retained in position by suitable friction means; a drill lip-rest adjustably secured to said slide; means for adjusting said slide for the purpose specified.

4. In a drill-grinder, a V-shaped holder; an adjustable slide in suitable ways on the front of the holder retained in position by suitable friction means; a drill lip-rest carried by said slide; means for adjusting said slide, for the purpose specified.

5. In a drill-grinding machine, the combination of a V-holder having a lip-rest at the front and containing a rectangular slot or way formed in the bottom of the V; an adjustable block I retained in said slot by suitable friction means and adjustable back and forth therein to accommodate drills with large chanks, for the purpose specified.

702,886. MEANS FOR HANGING SCREENS. CALVIN ROWLAND,
Denver, Colo. Filed Nov. 22, 1901. Serial No. 26,323. (No model.)

Claim.—1. In a window-screen, and attaching device therefor, the combination with the window-frame and the blind-steps, of a screen adapted to extend across the window-frame, against the outside faces of said blind-steps thereof; a strip interposed between the meeting-rail of the upper sash, and the top of the screen and extending across the window-frame from the inner face of one blind-step to the inner face of the other; supports secured to the top of the screen-frame, whose free ends are formed into hooks or loops, which are adapted to lie against the inner faces of the blind-steps, and means, such as nails or screws which extend loosely through the hooks or loops, and into the inner faces of the blind-steps, so as to pivotally secure the screen to the said blind-steps, substantially as shown.

2. In an improved window-screen and attaching device therefor, the combination with the window-frame the blind-steps and sash of a screen adapted to extend across the window-frame, and bear against the outside faces of said blind-steps thereof; a strip interposed between the meeting-rail of the upper sash and the top of the screen and extending across the window-frame from the inner face of one blind-step to the inner face of the other; a hook secured to the bottom of the screen, and a staple secured to the sill of the window, in each position as to be engaged by the

hook, so that the screen may be held in a closed position or against the outer faces of the blind-steps; supports secured to the inner face of the top members of the screen-frame, and at a slight distance from the ends thereof, the free ends of which are formed into hooks, which extend vertically, but inward, so as to lie against the inner faces of the blind-steps, and centrally of their width; and nails or screws which extend loosely through the said hooks and into the inner faces of the blind-steps, so as to pivotally secure the screen to the said blind-steps, substantially as described.

3. In an improved window-screen and attaching device therefor, the combination with the window-frame and sash and the blind-steps thereof of a screen adapted to extend across the window-frame and bear against the outside faces of said blind-steps; a projecting strip secured to the inner face of the top of the screen-frame, and extending from the inner face of one blind-step to the inner face of the other, the said strip lying against the meeting-rail of the upper sash; means secured to the bottom of the screen for holding the same in a closed position or against the outer faces of the blind-steps; supports secured to the top of the screen consisting of metal strips, the lower ends of which are provided with holes through which pass screws or nails for securing the said ends to the screen; while the upper portions of said strips are bent to form a short horizontal member, and then an upwardly-extending vertical member, the end of which is bent to form a hook, which is slightly constructed at its open end, the said hooks lying centrally of the width of the blind-steps; and nails or screws secured in the inner faces of the blind-steps upon which the said hooks are hung, so that the screen may have a swinging movement, substantially as shown.

4. In a window-screen, and attaching device therefor, the combination with a window-frame and its blind-steps, of a screen adapted to extend across the said frame against the outside faces of said blind-steps; a strip interposed between the meeting-rail of the upper sash and the top of the screen and extending across the window-frame from the inner face of one blind-step to the inner face of the other; supports secured to the top of the screen, whose free ends are formed into hooks or loops, which are adapted to lie against the inner faces of the blind-steps, and means, such as nails or screws which extend loosely through the hooks or loops, and into the inner faces of the blind-steps, so as to pivotally secure the screen to the said blind-steps, substantially as described.

702,887. APPARATUS FOR FERROFERRIC MUND-SHISTS.
HARRY M. SALTER, New York, N. Y., assignor to John H. Ludwig and
Charles A. Brown, New York, N. Y. Filed of Ludwig & Co. Filed
Sept. 26, 1901. Serial No. 76,004. (No model.)

Claim.—1. An apparatus of the character described comprising a

plurality of cutting instruments, means for actuating them, means for adjusting said instruments bodily and conjointly relatively to a strip to be cut, and means for independently controlling the operation of each of said cutting instruments, substantially as described.

2. An apparatus of the character described comprising a plurality of cutting instruments, means for supporting a strip relatively thereto, means for actuating said instruments, means for adjusting the positions of said instruments and the strip bodily back and forth relatively to each other in the transverse direction of said strip, and means for independently controlling the operation of each of said instruments, substantially as described.

3. An apparatus of the character described comprising a plurality of cutting instruments, means for supporting a strip relatively thereto, means for actuating said instruments, means for adjusting the positions of said instruments and the strip bodily back and forth relatively to each other in the transverse direction of said strip, means for adjusting the positions of said instruments and the strip bodily back and forth relatively to each other in the longitudinal direction of said strip, and means for independently controlling the operation of each of said instruments, substantially as described.

4. An apparatus of the character described, comprising a plurality of cutting instruments, means for actuating said instruments, a carriage supporting said instruments, a frame to which said carriage is adjustably connected, and means for independently controlling the operation of each of said instruments, substantially as described.

5. An apparatus of the character described comprising a plurality of cutting instruments, means for actuating said instruments, a carriage supporting said instruments, a frame to which said carriage is adjustably connected, means for independently controlling the operation of each of said instruments, and means for adjusting the positions of said carriage and a strip to be operated upon relatively to each other in the longitudinal direction of said strip, substantially as described.

6. An apparatus of the character described comprising a plurality of cutting instruments, means for operating the same, means for independently controlling the operation of each instrument, means for adjustably supporting said instruments, an indicator, and a scale corresponding to the notes in an octave, whereby said cutting instruments may be adjusted simultaneously into positions corresponding to any note in an octave, substantially as described.

7. An apparatus of the character described comprising a plurality of cutting instruments, means for operating the same, means for independently controlling the operation of each instrument, means for adjustably supporting said instruments, an indicator, and a scale corresponding to the notes in an octave whereby said cutting instruments may be adjusted si-

multaneously into positions corresponding to any note in an octave, and means for adjusting said cutting instruments in a direction perpendicular to the last-mentioned direction of adjustment, substantially as described.

8. An apparatus of the character described comprising a plurality of cutting instruments arranged at distances apart in a substantially straight line, means for operating the same, means for independently controlling each of said cutters, and means for permitting the simultaneous and coincident adjustment of said cutters in the direction of said line, and means for permitting the simultaneous and coincident adjustment of said cutters in a direction perpendicular to said line, substantially as described.

9. In an apparatus of the character described, a frame, means for adjustably supporting the same, a plurality of cutters carried by said frame, means for operating said cutters, and means carried by said frame for independently controlling the operation of each cutter whereby the cutters and their controlling means may be adjusted simultaneously into different positions, substantially as described.

10. In an apparatus of the character described, a frame, means for adjustably supporting the same, a plurality of cutters carried by said frame, means for operating said cutters, means carried by said frame for independently controlling the operation of each cutter whereby the cutters and their controlling means may be adjusted simultaneously into different positions, a carriage supporting said frame, and means for adjustably supporting said carriage to permit it to move in a direction perpendicular to the above-mentioned adjustment of said frame, substantially as described.

11. An apparatus of the character described comprising a plurality of cutters, a cylinder and piston for each cutter, means for supplying said cylinder with a propulsive medium, a valve for each cylinder to control the admission of the propulsive medium thereto, and a key-controlled device associated with each valve for controlling the operation thereof, a frame carrying said cylinders and cutters, and means for adjustably supporting said frame to permit the same to be adjusted in directions perpendicular to each other, substantially as described.

12. An apparatus of the character described comprising a plurality of cutters, a cylinder and piston for each cutter, a valve for each cylinder, a diaphragm connected with each valve having a chamber on the side opposite the valve, and a key-controlled valve connected with said chamber for regulating the operation of the first-mentioned valve by differential pressure in the diaphragm, substantially as described.

13. An apparatus of the character described comprising a plurality of cutters, a cylinder and piston for each cutter, a valve for each cylinder, means for operating said valve, an auxiliary valve to control said means, and a key to control the operation of said valve, substantially as described.

14. An apparatus of the character described comprising a plurality of cutters, a cylinder and piston for each cutter, a valve for each cylinder, a diaphragm connected with said valve having a chamber on the side opposite the valve, a pipe connected with each chamber, a valve to control the outlet of each pipe, a continuously-operative member to actuate said valve, and a key for each valve to control its operation by said member, substantially as described.

15. An apparatus of the character described comprising a plurality of cutters, a cylinder and piston for each cutter, a valve for each cylinder, a diaphragm connected with each valve having a chamber on the side opposite the valve, a pipe connected with each chamber, a valve to control the outlet of each pipe, a continuously-operative shaft having actuating portions for each valve, a member acting upon the valve to be operated by each of said portions of the shaft, and a key to control each of said members, substantially as described.

16. The combination of a cutter, a cylinder and piston, a head for said cylinder having parts, a valve to control said parts, a diaphragm connected with said valve and having a chamber on the side opposite the valve, a pipe extending from said chamber, a valve to control the outlet of said pipe, a continuously-operative member to control said valve, and a key to control the operation of said valve by said member, substantially as described.

17. The combination of a cutter, a cylinder and piston, a head for said cylinder having parts, a valve to control said parts, a diaphragm connected with said valve and having a chamber on the side opposite the valve, a pipe extending from said chamber, a valve to control the outlet of said pipe, a continuously-operative shaft having actuating portions, a member to be operated by said shaft to act on the valve, and a key to control said member, substantially as described.

18. The combination of a cutter, a cylinder and piston, a head for said cylinder having parts, a valve to control said parts, a diaphragm connected with said valve and having a chamber on the side opposite the valve, a pipe extending from said chamber, a valve to control the outlet of said pipe, a continuously-rotative shaft having correspondingly depressed and raised portions, a member having a hook-like end and provided with a finger to be acted upon by the shaft and to act on the valve, and a key to control said member, substantially as described.

19. An apparatus of the character described comprising a frame, a bar carried thereby over which a strip to be perforated may pass, a motor carried by said frame, means for operating the motor, key-controlled devices for controlling the punch-opening mechanism, a frame carrying said cylinders and cutters, and means for adjustably supporting said frame to permit the same to be adjusted in directions perpendicular to each other, substantially as described.

20. An apparatus of the character described comprising a carriage, means for supporting the same, a frame adjustably carried by said carriage, cutters carried by said frame, means for operating said cutters, a spring, and an component for adjusting said frame, substantially as described.

21. An apparatus of the character described comprising a carriage, means for supporting the same, a frame adjustably carried by said carriage, cutters carried by said frame, means for operating said cutters, a spring and component for adjusting said frame, and means for advancing said carriage step by step, substantially as described.

22. The combination of a frame, means for adjustably supporting the same, a spring connected with said frame for moving it in one direction, and an component comprising a rack, an oscillatory member having a pawl and a dog to engage the rack, means for maintaining the dog out of engagement with the rack and the pawl normally in engagement therewith, and means for operating said pawl and dog whereby the carriage may be fed step by step, substantially as described.

23. The combination of a frame, means for adjustably supporting the same, a spring connected with said frame for moving it in one direction, and an component comprising a rack, an oscillatory member having a pawl and a dog to engage the rack, means for maintaining the dog out of engagement with the rack and the pawl normally in engagement therewith, means for operating said pawl and dog whereby the carriage may be fed step by step, and a relative member connected with said frame for drawing the same against the tension of the spring, substantially as described.

24. In an apparatus of the character described a plurality of cutters, an adjustable frame supporting the same, a carriage supporting said frame, means for controlling the operation of said cutters independently, means for adjusting said carriage step by step, a scale, and an indicator for use in determining the adjustment of the carriage, substantially as described.

25. An apparatus of the character described comprising a frame, a plurality of cutters carried thereby, cylinders and pistons for operating said cutters, a tube connected with said cylinders, means for supplying said tube with a propulsive medium, means for independently controlling the supply of propulsive medium from said tube to each cylinder and including therein a relative shaft for actuating said means, and a motor carried by said frame for operating said shaft, substantially as described.

26. The combination of a tube, a valve to control its outlet, a relative member to actuate said valve, and means to control the operation of said valve by said member, substantially as described.

27. The combination of a tube, a valve to control its outlet, means to reciprocate said valve, and a key acting with the valve to normally hold it closed and arranged to release the valve when operated, substantially as described.

28. The combination of a tube, a valve to control its outlet, a shaft having means to actuate said valve, a member to hold the valve closed when released by the shaft, and a key to control said member, substantially as described.

29. The combination of a tube, a block having a port to which the tube leads, a valve to control said port, a member to act on the valve, a shaft to actuate said member, and a key to control said member, substantially as described.

702,888. SPRING-HINGE. WILLIAM A. SCHNEIDER, Gloucester City, N. J., assignor of one-half to William F. MacLennan, Gloucester City, N. J. Filed Mar. 7, 1902. Serial No. 97,006. (No model.)

Claim.—1. A spring-hinge having two members, each of the same consisting of a piece of material formed with a plurality of loops, the loops of one member being in engagement with the loops of the other, substantially as described.

2. A spring-hinge consisting of two members each made of a piece of material bent to form a plurality of loops, the loops of each member

being in engagement with those of the other and having curved portions at their points of engagement, said portions being offset and thereby retaining the members of the hinge in proper operative relation to one another, substantially as described.

3. A spring-hinge consisting of two similar members each made of a piece of flexible material bent to form a plurality of loops, said loops lying in substantially the same plane, the loops of each member being meshed with those of the other and each pair of intermeshed loops being free to move toward or from each other when one of the members is moved from its normal position, substantially as described.

4. A spring-hinge consisting of two similar members, each of said members consisting of a single piece of flexible material bent at its middle portion so that its two halves extend at an angle to one another, the ends of each of these halves being curved toward each other and back so as to form two loops; the loops of each member being intermeshed with the corresponding loops of the other member, substantially as described.

702,889. COAL-CRUSHER. AMBERL W. F. STERN, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Apr. 8, 1902. Serial No. 679,878. (No model.)

Claim.—1. In a crushing mechanism, the combination of a frame, a relatively stationary roll, an opposing bodily-movable roll, means for rotating the rolls, a toggle mechanism acting on the movable roll to force the latter toward the stationary roll, said toggle mechanism comprising elongated abutment-pieces arranged parallel with the movable roll and having their sides which are parallel with said roll connected pivotally with each other, a lever connected with said abutment-pieces and a weight connected with said lever for moving the said sides of the abutment-pieces vertically, substantially as set forth.

2. In a crushing mechanism, the combination of a frame, a relatively stationary roll, an opposing bodily-movable roll, means for rotating the rolls, a toggle mechanism acting on the movable roll to force the latter toward the stationary roll, said toggle mechanism comprising abutment-pieces inclined downwardly toward each other and connected pivotally, a link connected with said abutment-pieces and extending upward therefrom, a lever connected with said link, and a weight acting on the lever for moving the connected ends of said abutment-pieces vertically, substantially as set forth.

3. In a crushing mechanism, the combination of the frame, the crushing-roll thereon, the opposing crushing-roll mounted in a yielding bearing, the links, K, K', pivoted respectively to the frame, and to the yielding roll, and pivotally connected with each other, the abutment-pieces, P and R, secured to the said links and respectively rocking against surfaces carried by the roll and the frame respectively, said links and abutment-pieces forming a toggle, the weighted lever, L, and the link connecting said lever to the toggle, substantially as described.

702,890. BRAKE-SHOE. ALFRED L. STERNER, Chicago, Ill. Filed Jan. 27, 1902. Serial No. 91,578. (No model.)

Claim.—1. A brake-shoe comprising an attaching-eye consisting of an upwardly bent or bowed wire or wires, the lower portions of which are rigidly secured to the body of said brake-shoe and a wire or wires which extend longitudinally of said brake-shoe and are secured thereto, substantially as described.

2. A brake-shoe comprising an attaching-eye consisting of an upwardly bent or bowed wire or wires the lower portions of which are embedded in the body of the shoe and a wire or wires which extend longitudinally of said shoe and are secured thereto, substantially as described.

3. A brake-shoe comprising an attaching-eye consisting of an upwardly bent or bowed wire or wires the lower portions of which are embedded in said shoe, the end portions of said wire or wires extending longitudinally of said brake-shoe and being secured thereto, substantially as described.

bedded in said shoe, the end portions of said wire or wires extending longitudinally of said brake-shoe and being secured thereto, substantially as described.

4. A brake-shoe comprising an attaching-eye consisting of upwardly bent or bowed wires the lower portions of which are embedded in said shoe, the end portions of said wires being disposed to form the guide-lugs of said shoe, substantially as described.

5. A brake-shoe comprising wires secured to the body of said shoe, portions of which are disposed as to form the guide-lugs thereof, substantially as described.

6. A brake-shoe comprising a wire or wires which extend longitudinally of said shoe and are upwardly bent or bowed at the middle of said shoe to form an attaching-eye therefor, substantially as described.

7. A brake-shoe comprising wires which are upwardly bent or bowed at the middle of the shoe to form an attaching-eye and which comprise end portions which extend longitudinally of said brake-shoe in the same direction, substantially as described.

8. A brake-shoe comprising a body having integral retaining-lugs, and a wire attaching-eye only parts of which are embedded in said lugs, substantially as described.

9. A brake-shoe comprising a body having integral retaining-lugs, and a wire attaching-eye the bowed or upwardly-bent part of which is bare and the lower parts adjacent to said body are embedded in said lugs, substantially as described.

10. A brake-shoe comprising an attaching-eye consisting of an upwardly bent or bowed wire or wires, a wire or wires which extend longitudinally of said shoe to which the attaching-eye is secured and a retaining-lug in which the portion of said attaching-eye adjacent to the body of the shoe is embedded, substantially as described.

11. A brake-shoe comprising an attaching-eye consisting of an upwardly bent or bowed wire or wires the end portions of which extend lengthwise of the shoe and are secured thereto and a retaining-lug in which the portion of said attaching-eye adjacent to the body of the shoe is embedded, substantially as described.

12. A brake-shoe comprising a wire or wires which extend lengthwise of said shoe and are upwardly bent or bowed at the middle of said shoe to form an attaching-eye therefor and a retaining-lug in which the portion of said attaching-eye adjacent to the body of the shoe is embedded, substantially as described.

702,891. GRATE-BAR. HENRY THOMSON, Toronto, Canada. Filed Mar. 2, 1902. Serial No. 7,157. (No model.)

Claim.—A grate-bar made in a single casting and comprising two ends having each a series of corrugations upon their upper edges, transverse formed upon the outer faces thereof, a lag depending from the lower portion of one of the ends so that a series of the bars may be secured to be rocked in unison, a pair of longitudinal parallel bars connecting the ends together and having their upper edges grooved and in line with the corrugations of said ends, a series of transverse sections in parallel with the ends and supported by the bars, said sections being provided with corrugations similar in shape and number to the corrugations of the ends and having the same ones in line with said bars, said sections also having their lower edges in the same line but above the lower edges of the bars, and brace-rods connected to the inner faces of the ends and adjacent faces of the outer sections intermediate of the bars so that each brace-rod's groove is in line with the central corrugation of the ends and sections.

702,892. ORB-ELEVATOR. HENRY A. VINE, Denver, Colo., assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Dec. 15, 1901. Serial No. 88,578. (No model.)

Claim.—1. In an elevator for pulverized ore and similar material, the combination of the loading-drum formed with the peripheral tubes extending beyond the periphery of the drum, the sprocket-wheel rigid with the drum, the series of buckets, the chains carrying said buckets, and the series of forked sprockets with threaded stems, radially adjustable on said wheels, arranged substantially as set forth, whereby the sprockets can be so adjusted as to cause the proper righting of the buckets with the

filling-tubes and permit variations in the pitch distances of the sprocket-forks and the chain lengths; substantially as set forth.

2. The combination with the loading-drum, having the vertically-arranged conical parts and the filling-tubes between the conical parts, the two series of independently-adjustable forked sprockets rigidly connected to the filling-drum to form substantially two sprocket-wheels, the sprockets of one series being radially adjustable independently of the sprockets of the other series, the series of buckets adapted to register with the said filling-tubes and the chains carrying said buckets and formed of the alternating inner links with bars, G, G, and the outer links with the bars, G', G', the pinions, H, H', hinging the alternating links together, spacing devices between the inner bars, G, G, and the thimbles, T, T, on the pinions outside of the outer bars and adapted to engage with the forks in the adjacent sprockets, substantially as set forth.

702,893. PUNCH-POST, TELEGRAPH-POLE, OR THE LIKE. ISAAC H. WARREN, Union City, Mich., assignor to Frank C. Rose, Union City, Mich. Filed July 16, 1901. Serial No. 93,365. (No model.)

Claim.—1. The combination of a base, a screw thereon, a post or the like having a bore in its lower portion into which said screw extends, a nut on the latter and supporting said post, and stays for said post, whereby said stays may be tightened by turning said nut to adjust said post vertically on said screw, each of said stays having means to vary the length thereof, substantially as described.

2. The combination of a base, a screw thereon, a post or the like having a bore in its lower portion into which said screw extends, a nut on the latter and supporting said post, an anchor below the base, and stays connecting said anchor to said post, substantially as described.

3. The combination of a base, a screw thereon, a post or the like having a bore in its lower portion into which said screw extends, a nut on the latter and supporting said post, an anchor below the base and stays connecting said anchor to said post, said stays passing through openings in said base, substantially as described.

4. The combination of a buried anchor, a base above the same, and separated therefrom, a post or the like, a screw supporting the same on said base whereby said post may be vertically adjusted by said screw, and stays or braces connecting the said buried anchor to said post, whereby said stays or braces may be tightened and the earth between said buried anchor and the base compressed by adjusting said post on said supporting-screw, substantially as described.

702,894. CONVEYER. ALFRED J. WHEAT, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Sept. 14, 1898. Serial No. 592,458. (No model.)

Claim.—1. In a conveyor, the combination of the propelling-chain, a block secured to each chain and provided with an inwardly-extending pin, a bucket, and arms connected to the bucket at one end and having their other ends pivotally connected to the inwardly-extending pins, substantially as set forth.

2. In a conveyor, the combination of the two parallel propelling-chains, blocks secured to said chains in line with each other, guide-rolls arranged at one side of and extending parallel to the chains, a bucket having guide-wheels fitted to ride on said rolls, and arms pivotally connected to the blocks and also connected to the bucket, substantially as set forth.

3. In a conveyor, the combination with a series of buckets arranged to form a continuous trough when in line with each other, of anti-friction-rollers arranged at the adjacent edges of each pair of buckets, substantially as set forth.

4. In a conveyor, the combination of a guideway, an endless propelling mechanism, and a series of buckets, connected to said propelling mechanism and each having guide wheels or rollers mounted so as to

travel on the guideway, and an anti-friction-roller, extending transversely of the bucket and adapted to receive the thrust of the adjacent bucket, substantially as set forth.

5. In a conveyor, the combination of the propelling-chains, a series of buckets connected therewith and having hinged bottoms, a catch connected to one of the walls of each bucket to hold the hinged bottom in a closed position, a tripping device, and means for adjusting said tripping device laterally toward and from a position in the path of a projection on each of said catches, substantially as set forth.

6. In a conveyor, the combination of the parallel propelling-chains, a series of pins or studs, rigidly secured to each of said chains and extending inwardly therefrom, a bucket arranged between said chains, and two sets of supporting-arms, D, pivotally supported on transversely-angled pins or studs, E, at their upper ends and having their lower ends connected to the walls of the bucket, substantially as set forth.

7. In a conveyor, the combination of the parallel endless propelling-chains, the blocks, B, secured to said chains at regular intervals and each having an inwardly-extending flange and a pin, which is in line with a corresponding oppositely-extending pin, a series of buckets, and the oppositely-inclined integral supporting-arms, D, flared at their center upon one of said pins or studs, E, and having their ends connected to the bucket, there being two sets of said arms for every bucket, one on one end and one on the other, substantially as set forth.

8. In a conveyor, the combination, with the propelling-chains, and the buckets connected to said chains to move therewith and having hinged bottoms, of latches secured to the buckets and adapted to maintain the bottoms thereof in their closed positions, and a horizontally-movable lever fulcrumed below the buckets, and means for moving said lever into or from the path of the latches, substantially as set forth.

9. In a conveyor, the combination with the propelling-chains, and the buckets connected to said chains to move therewith and having a vertically-oscillating bottom, of spring-latches connected to opposite sides of the bucket and adapted to extend below the bottom to hold the latter in its closed position, two levers fulcrumed below the bucket for releasing the latches from the bottom, an operating-lever, and a toggle-joint connecting the operating-lever with the latch-levers, substantially as set forth.

10. In a conveyor, a series of buckets arranged each closely adjacent to the next, a carrier for the buckets moving from one line to another, and an anti-friction-roller secured to each bucket and lying between the adjacent edges thereof and adapted to contact with the adjacent bucket, substantially as set forth.

11. In a conveyor, the combination with the buckets arranged in series edge to edge, and each having a downward-inclined wall adjacent to the neighboring bucket, of an anti-friction-roller carried by said bucket near the upper edge of the said inclined wall and adapted to contact with the neighboring bucket at times of swinging of either of the buckets, substantially as set forth.

12. In an endless conveyor the combination of the chains, the series of buckets, the pivots between each bucket and the chains arranged centrally above the bucket, the track having the horizontal section and the upwardly-extending sections, the supporting roller or wheel at the end of the bucket in front of the central transverse plane thereof and adapted to rest continuously against said horizontal and vertical track-sections and the joining device between the bucket and the said pivots and connected to the bucket at points in rear of its said central transverse plane, whereby as the bucket travels upward the inner part thereof has support against the thrust from the said wheel, substantially as set forth.

13. In a conveyor the combination of the endless chain, the buckets, each united by pivotal connections to the chains at points above the center, vertically, of the buckets, and two wheels at each end of each bucket below the top portion thereof, a horizontal track upon which both of said wheels rest in common, and vertical tracks, one bearing against the outside of one wheel, and the other against the inside of the other wheel, substantially as set forth.

14. The combination with a conveyor-bucket, of a support for uniting it with a chain comprising diverging arms connected with the end parts of the bucket, and having a hinge or pivotal bearing for connection with the chain where the said arms join, substantially as set forth.

15. In a conveyor the combination with a pair of parallel chains, of a series of buckets arranged between the chains, supports for uniting the buckets with the chains, each support comprising diverging arms which are connected with a bucket at separated points, hinge or pivotal connections between the chain and the said supports, supporting rollers or wheels connected with the buckets, and tracks upon which said wheels run, substantially as set forth.

16. In a conveyor the combination of a pair of parallel chains, suspended swinging buckets arranged between the said chains, supports for connecting the buckets with the chains, each comprising a pair of diverging arms which are secured to the ends of the buckets at points respec-

tively in front and rear of the axis of suspension for that bucket, and pivotal or hinge connections between the chains and the said supports, the said diverging arms being so arranged as to bring the said pivotal or hinge connections for the buckets near the top portions thereof, substantially as set forth.

702,895. SPARKING DEVICE. CLARENCE G. WHITE, Minneapolis, Minn., assignor to Globe Iron Works, Minneapolis, Minn., a Corporation of Minnesota. Original application filed Dec. 8, 1900, Serial No. 38,448. Divided and this application filed Feb. 12, 1902. Serial No. 92,552. (No model.)

Claim.—1. The combination, in an internal-combustion engine, with a fly-wheel provided with the ring 11 and with the internal rim 17, of a dynamo mounted upon a movable base and provided with friction-wheels 10 and 14, and means for bringing one of said wheels in contact with said ring, or the other wheel in contact with said rim, for the purpose set forth.

2. The combination, with the fly-wheel, provided with ring-surfaces of different diameters, of a dynamo provided with a movable base and with friction driving-pulleys adapted to be brought into contact with one or the other of the ring-surfaces upon said fly-wheel, substantially as described.

3. The combination, with a fly-wheel having ring-surfaces of different diameters, the dynamo provided with a vertically-movable base, carrying standards in which the dynamo-shaft is mounted, a friction-wheel upon the dynamo-shaft, a friction-wheel mounted upon a movable support, and means for raising or lowering said base, whereby one of said wheels may be brought in contact with the smaller ring-surfaces or the other wheel may be brought in contact with the larger ring-surfaces, substantially as described.

702,896. SIDE BEARING FOR RAILWAY-CARS. CHARLES H. WILLIAMS, JR., Chicago, Ill., assignor to Chicago Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 12, 1902. Serial No. 92,776. (No model.)

Claim.—1. In a side bearing for railway-cars, the combination with burden-carrying balls, of anti-friction devices under said balls for supporting the same, said anti-friction devices being arranged to the side of the vertical axes of said balls, and a support having recesses in which recesses are located said anti-friction devices; substantially as described.

2. In a side bearing for railway-cars, the combination with a casting having recesses, of anti-friction devices arranged around the side walls of said recesses, and burden-carrying devices supported by said anti-friction devices; substantially as described.

3. In a side bearing for railway-cars, the combination with a support having recesses, said recesses having undercut walls in their side walls, anti-friction devices in said walls, and burden-carrying balls; substantially as described.

4. In a side bearing for railway-cars, the combination with a casting having marginal flanges, of anti-friction devices arranged in a hub-cast, burden-carrying balls supported at different points by said anti-friction devices, and means for holding said balls in position; substantially as described.

702,897. MACHINE FOR WASHING COAL. AS. FREDERICK R. WILLIAMS, JR., Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Nov. 7, 1898. Serial No. 730,147. (No model.)

Claim.—1. The combination of the chambers F and J, terminating in opposing flanges, the valve-box formed separately from and secured to the said opposing flanges, and having a plate g which extends to points inside of the walls of the chambers F and J, the rectilinearly-sliding valve in the said valve-box, and anti-friction supporting devices for the valve situated in the interior of the chamber J, substantially as set forth.

2. The combination of the upper chamber F formed with the flange f' at the bottom, the lower chamber J with the flange j at its upper end, the intermediate valve-box formed separately from and interposed between the said chambers F and J, and having the upper plate and the lower plate extended to points inside of the walls of the chambers F and J, the valve-plate in said box between the upper and lower plates thereof and having an aperture of less horizontal area than the interior area of the chambers F and J, substantially as set forth.

3. The combination of the chambers F and J terminating in opposing flanges, the valve-box formed separately from and secured to the said flanges, and having an upper plate and a lower plate which extend to points inside of the outer walls of the chambers F and J, a rectilinearly-sliding valve in the said box, and anti-friction supporting devices for the valve within the chamber J and supported from the lower plate of the valve-box, substantially as set forth.

4. The combination of the chambers F and J terminating in opposing flanges, the valve-box formed separately from and secured to the said flanges, and having an upper plate and a lower plate extending to points inside of the wall of the chamber J, the rectilinearly-sliding valve in the said box, the vertically-adjustable rollers in the chamber J and the roller-carriers supported by the lower plate of the valve-box, substantially as set forth.

5. The combination of the chambers F and J, the valve-box between them and detachable therefrom, the rectilinearly-sliding valve having two roller-bearing surfaces along its side edges, each of which is formed with an inclined portion, and two rollers supported by the valve-box and situated on opposite sides of and on the median line of the communication between said chambers, and each adapted to engage with one of the said surfaces of the valve; substantially as set forth.

6. The combination with the chamber F and the chamber J, of the intermediate valve-box having the supports f' situated within the chamber J, the roller-carrier held and guided by said supports, the roll in said carrier and the rectilinearly-sliding valve resting upon the said roll, substantially as set forth.

7. The combination with the chambers F and J, of the detachable valve-box between them formed of the upper longitudinally-recessed relatively longer plate G, the lower relatively shorter plate I, the valve in said box between said plates, formed with the relatively large aperture remote from its ends, and with the two parallel rows of notches, means for guiding said valve through the greater part of its travel on an inclined line, said means comprising supporting-rolls within the section J and directly under the lower part of the valve-plate, and the pistons and piston-shaft, substantially as set forth.

8. In a coal-washer, the combination of upper and lower chambers, a sliding valve between said chambers, and means above the valve forming a shoulder or flange extending forward beyond the walls of said upper and lower chambers.

9. In a coal-washer, the combination of upper and lower chambers, a sliding valve between said chambers having cam-surfaces A' and rollers

mounted below the valve and on each side of and on the median line of the communication between the chambers, and adapted to engage said surfaces.

10. In a coal-washer, the combination of upper and lower chambers, a sliding valve between said chambers, housings, *T*, separate from the walls of and within the lower chamber, and rollers journaled in said housings and supporting the valve.

11. In a coal-washer, the combination of upper and lower chambers, a sliding valve between said chambers, housings separate from the walls of and within the lower chamber and adjustable in directions transverse to the valve, and rollers journaled in said housings and supporting the valve.

12. In a coal-washer, the combination of upper and lower chambers, a sliding valve between said chambers, rollers in said lower chamber and supporting the valve, and adjusting means for said rollers, whereby the rollers may be set toward or from the plane of operation of the valve.

13. In an ore and coal washer, the sliding-valve plate, having the aperture *A*, the impervious portion, the supporting-surfaces *N*, at the side of the plate, and the incline or cam, *M*, at the ends of the supporting-surfaces and substantially in line with and at opposite sides of the middle of said impervious portion.

702,898. AUTOMATIC STRINGED MUSICAL INSTRUMENT.

FREDERICK W. WOOD and EDWARD H. STILES, JR., KANSAS CITY, Mo.; said STILES assignor to said WOOD. Filed July 2, 1901. Serial No. 94,532. (No model.)

Claim.—1. In an instrument of the character described, a reciprocating rod, a picker pivoted to said rod and held yielding against pivotal movement in either direction, and a cam for causing the point of the picker as it moves forward to be depressed and then rise to its original plane, and as it moves backward to be again depressed and again rise to its original plane, substantially as described.

2. In an instrument of the character described, a reciprocating rod, a picker pivoted to said rod and held yielding against pivotal movement in either direction, a fixed pin, and a cam provided with converging cam-faces and secured to said rod, and having its cam-faces engaging said pin, substantially as described.

3. In an instrument of the character described, a reciprocating rod, a picker pivoted to said rod and held yielding against pivotal movement in either direction, a fixed pin, a cam provided with converging cam-faces and secured to said rod, and having its cam-faces engaging said pin, and a spring holding said cam and pin in yielding engagement, substantially as described.

4. In an instrument of the character described, a frame, an adjustable pin carried thereby, and provided with flanges, a reciprocating rod provided with a cam engaging said pin, and a picker pivoted to the end

of said rod and held yielding against pivotal movement in either direction, substantially as described.

5. In an instrument of the character described, a reciprocating rod, a picker pivoted thereby, a spring-actuated sliding collar upon the rod, and provided with an arm above and below the pivotal point of the picker, substantially as described.

6. In an instrument of the character described, a hinged reciprocating rod, a picker pivoted to the free end of the rod and having pivotal movement in the same plane as that of the rod, a spring holding the picker against pivotal movement in either direction, and a cam to cause the point of the picker to descend and rise again in its retrograde as well as its advance movement, substantially as described.

7. In an instrument of the character described, an exhaust-chest, a valve therein, comprising a casing having a lower chamber communicating with the exhaust-chest, and an upper chamber communicating with the atmosphere, a perforated partition separating said chambers, and a perforated bottom for the casing, a tube communicating with the lower chamber through said perforated bottom, a piston mounted in the lower chamber and provided with a small passage, and a valve mounted on the piston-stem, and adapted to alternately close communication between said chambers or to prevent external air entering the upper chamber, substantially as described.

8. In an instrument of the character described, a pair of valve casings, tubes connecting said casings, one of said casings being provided with an opening, and with a second pair of tubes, a tubular block between each of said second tubes and said opening, a tubular block in the other casing between the connecting-tubes, a tube connected to the last-named casing and communicating with said tubular block, a reciprocating stem extending longitudinally of each casing, a valve upon one stem adapted to alternately close the passage of the tubular blocks of said casing, and a pair of valves upon the other stem adapted to alternately engage the tubular block of said casing, the lower valve being adapted to be seated and unseated synchronously with the single valve of the other casing, substantially as described.

9. In an instrument of the character described, a pair of casings, tubes connecting said casings, one of said casings being provided with an opening, and with a second pair of tubes, a tubular block between each of said second tubes and said opening, a tubular block in the other casing between the connecting-tubes, a tube connected to the last-named casing and communicating with said tubular block, a reciprocating stem extending longitudinally of each casing, a valve upon one stem adapted to alternately close the passage of the tubular blocks of said casing, a pair of valves upon the other stem adapted to alternately engage the tubular block of said casing, the lower valve being adapted to be seated and unseated synchronously with the single valve of the other casing, a pneumatic chamber, a flexible diaphragm therein, a piston mechanism actuated thereby, tubes connecting said second tubes with said pneumatic chamber at opposite sides of said diaphragm, and means so the valves of said casings are operated to synchronously exhaust the air at one side of the diaphragm and supply air to the other, substantially as described.

10. In a machine of the character described, this combination of a suitable support, a series of levers suitably supported and provided with fingers for pressure upon the strings of the instrument contiguous to the frame, a series of bellows provided with arms at one end for engagement with said levers at the side of their pivots opposite from said fingers, rods suitably guided and connected to said levers, springs engaging said rods and tending to inflate the bellows and hold the fingers out of contact with the strings and exhaust-tubes connected with the bellows and adapted by creating a vacuum therein to collapse them and cause them to operate said levers and thereby synchronously overcome the resistance of said springs and throw said fingers into engagement with the strings, substantially as described.

702,899. JOURNAL-BOX. GEORGE A. WOODMAN, Chicago, Ill., assignor of three-fourths to Kirby Lumber Company, a Corporation of Illinois. Filed June 2, 1901. Serial No. 93,748. (No model.)

Claim.—1. In a journal-box, the combination with a key or wedge, of a pin removably secured across the corner formed by the top and side of the box to prevent endwise movement of the key or wedge.

2. In a journal-box, the combination with a key or wedge, of a curved pin arranged in the corner formed by the top and side of the box to prevent endwise movement of the key or wedge.

3. In a journal-box provided with openings in its top and side adjacent to the corner formed thereby, the combination of a key or wedge, and a pin removably secured in said openings across said corner to prevent endwise movement of the key or wedge.

702,900. JOURNAL-BOX LID. GEORGE A. WOODMAN, Chicago, Ill., assignor of three-fourths to Kirby Lumber Company, a Corporation of Illinois. Filed June 2, 1901. Serial No. 93,744. (No model.)

Claim.—1. The combination with a journal-box having an opening therein and a lid thereof, of a locking device carried by said lid, said locking device consisting of a plate slidably supported on the inner side of the lid and resting upon the lower wall of the opening in the box when the lid is closed, and a flat spring secured to the lid above the plate and bearing upon said plate to hold same in engagement with said lower wall of the opening, substantially as described.

2. The combination with a journal-box and a lid thereof, of a shoulder on the box, a locking device on the lid, and a flat spring fastened to the lid and having its upper end bearing against said shoulder and its lower end bearing against said locking device, substantially as described.

3. The combination with a journal-box having an opening therein, of a lid for said opening provided with a flange and guide-lugs on its inner side, a locking device consisting of a plate slidably mounted on the inner side of the lid and provided with extensions at its ends arranged to operate within said guide-lugs and against said flange, and a spring bearing on the plate, substantially as described.

4. The combination with a journal-box having an opening therein and a rib on the lower edge of the opening, of a lid for said opening, a locking-plate slidably mounted on the inner side of the lid and provided with a recess in its lower edge to receive the rib on the box, and a spring secured to the lid and bearing upon said plate, substantially as described.

5. The combination with a journal-box lid, of a locking-plate slidably supported on the inner side thereof and provided with a recess in its lower edge and a rounded shoulder adjacent thereto, substantially as and for the purpose described.

6. The combination with a journal-box lid, of a locking-plate slidably supported on the inner side thereof to engage and rest upon the lower edge of the opening in the box, and a spring fastened to the inner side of the lid and pressing downward on the plate to force the plate down upon the lower edge of the box-opening and effect a locking engagement of the plate therewith when the lid is closed, substantially as described.

7. The combination with a journal-box lid, of a locking-plate slidably supported on the inner side thereof and provided with a recessed seat and a rounded shoulder adjacent thereto, substantially as and for the purpose described.

8. The combination with a journal-box lid, of a locking-plate slidably supported on the inner side thereof and provided with a recessed seat and a rounded shoulder adjacent thereto, and a spring fastened to the lid and having its lower end normally arranged in said seat, substantially as described.

9. The combination with a car-axle-box lid, of a locking-plate slidably supported on the inner side of the lid and provided with a recess in its lower edge and a rounded shoulder adjacent thereto, and having a recessed seat in its upper edge and a rounded shoulder adjacent thereto, and a spring fastened to said lid and having its lower end arranged in said seat, substantially as described.

702,901. DUST-PROOF JOURNAL-BOX LID. GEORGE A. WOODMAN, Chicago, Ill., assignor of three-fourths to Kirby Lumber Company, a Corporation of Illinois. Filed Dec. 20, 1901. Serial No. 96,450. (No model.)

Claim.—1. The combination with a journal-box provided with an opening in the front thereof and a shoulder above said opening, of a

lid consisting of a plate for entirely covering the opening in the box, and a spring fastened on the inner side of the lid and passing through a slot in the plate and bearing against said shoulder, substantially as described.

2. The combination with a journal-box provided with an opening in the front thereof and a shoulder above said opening, of a lid consisting of a plate for entirely covering the opening in the box, a locking device on the lid, and a flat spring fastened to the lid and passing through an opening therein and having its lower end in operative engagement with the locking device on the under side of the lid and its upper end bearing against said shoulder, substantially as described.

3. A lid for journal-boxes consisting of a plate for entirely covering the opening in the box, a head on the outer side of the plate forming a chamber between itself and the plate, and a spring fastened to the plate and passing through an opening therein into the chamber, substantially as described.

4. A lid for journal-boxes consisting of a plate for entirely covering the opening in the box, a lug on the under side of the plate provided with an inclined opening, and a spring actuated in said opening and passing through an opening in the plate, substantially as described.

5. A lid for journal-boxes consisting of a plate for entirely covering the opening in the box, a head on the outer side of the plate forming a chamber between itself and the plate, a lug on the under side of the plate provided with an inclined opening, and a spring secured in said opening and passing through an opening in the plate into said chamber, substantially as described.

6. The combination with a journal-box provided with an opening in the front thereof and a shoulder above said opening, of a lid provided with an opening in that part thereof which covers the opening in the box, a flat spring passing through said opening in the lid and bearing against said shoulder, said lid comprising an upper portion 17 beneath the spring, substantially as and for the purpose described.

7. The combination with a journal-box lid having parallel slots therein, of a locking-plate on the under side of the lid, a lift-plate on the outer side of the lid, and pins adjacent to the ends of said lift-plate, and passing through the slots in the lid and connecting the locking-plate and lift-plate, said locking-plate being guided in its movement by the pins traveling in said slots, substantially as described.

8. The combination of a journal-box provided with an opening therein, a rib at the side and top edges of the opening in the box, a lid pivotally mounted on the box and comprising a plate entirely covering the opening in the box and provided with a groove to receive said rib, and a device at the bottom of the lid for locking the lid to the lower wall of the box-opening and forming with said rib and groove a continuous seal between the lid and the box, substantially as described.

9. The combination with a journal-box provided with an opening in the front thereof and a shoulder above said opening, of a lid consisting of a plate entirely covering the opening in the box, a head on the outer side of the plate forming a chamber between itself and the plate, and a spring fastened to the lid and having its lower end arranged on the inner side of the lid and its upper end extending through an opening in the plate into the head-chamber and bearing against said shoulder.

10. A lid for journal-boxes consisting of a plate for entirely covering the opening in the box, a head on the outer side of the plate forming a chamber, and a flat spring fastened to the plate and passing through an opening in the plate and having its upper end arranged in the head-chamber on the outer side of the plate and its lower end arranged on the inner side of the plate.

702,902. SUSPENDER. EDWIN S. HELLER, St. Paul, Minn. Filed Mar. 22, 1901. Serial No. 93,264. (No model.)

Claim.—1. A suspender consisting of two separable sections having means for connecting said sections at the back of the neck of the wearer, a pair of straps extending down the back one on each side of the spinal column, a second pair joined to the first pair near the center of the back of the neck and passing onto the shoulders, and means for attaching the free ends of said straps to the garment to be supported consisting of two entirely separate running-ords, one on each separable section.

2. In combination a pair of straps or webs extending up the back of the wearer, cyclets at the lower ends of said straps; a second pair of

straps or webs extending onto the shoulders from the back of the neck and attached to the upper ends of said back-straps; a spring-button by which the right and left sides of the suspender are separately connected behind and at the lower end of the neck of the wearer; eyelets upon the free ends of said shoulder-straps; separate cords, one passing through the eyelets of the group of straps on each side of the place of separation of said right and left sides and having button-loops on their ends, and a button-tab connected to each cord between the ends of the straps on each side of said place of separation.

3. A suspender consisting of a strap which extends from the back of the neck to the top of each shoulder, a pair of straps down the back, disposed substantially at right angles close to said shoulder-straps, a separable connection interposed substantially midway between the ends of said shoulder-straps, eyelets at the four free ends of said straps, a separate running-cord passing through the eyelets on each side of the place of separation and a button-tab slidingly disposed upon said cord between the free ends of each pair of side straps.

4. A suspender consisting of a strap passing around the back of the neck of the wearer and having its ends projecting one on each shoulder; a separable connection inserted midway between the ends of said strap; back-straps attached one to each section of said shoulder-strap adjoining said separable connection; each side of the suspender having an entirely separate running-cord connection with the garment to be supported.

5. In combination, a transverse strap or web from the top of the shoulders across the back of the neck; a connection by which said strap is separable at its center; a pair of straps down the back one on each side of the spinal column, said back-straps being attached to said first strap at substantially right angles near the center of said first strap; eyelets at the four free ends of said straps, an entirely separate cord looped through the eyelets on each side of the place of separation, with an intermediate button-tab freely disposed on each cord.

6. A suspender consisting of a pair of straps or webs extending up the back of the wearer, a second pair of straps or webs extending onto the shoulders and joined to said first pair at substantially right angles, a separable connection attached near the angles to said pairs of straps by which the right and left sides of the suspender are separately connected behind and at the lower end of the neck of the wearer; eyelets upon the free ends of said shoulder and back straps, buckles on said shoulder and back straps for adjusting the length of the straps, separate cords freely disposed through the eyelets of each pair of shoulder and back straps and having button-loops on their ends, and a button-tab freely disposed on each cord on each side of the place of separation.

7. A suspender consisting in combination of two separable sections joined together by a separable connection behind and at the lower end of the neck of the wearer, each separate section consisting of a substantially-vertical back-strap, a shoulder-strap joined to said back-strap near said separable connection at substantially right angles, eyelets on the free ends of said back and shoulder straps, a running-cord passing through said eyelets and having button-loops on its ends, one of which is adapted to attach to one of the buttons at the back on the garment to be supported, and a button-tab connected to said cord between the free ends of said shoulder and back straps.

8. In combination, a transverse strap or web from the top of the shoulders across the back of the neck, a spring-button by which said strap is separable at its center, a pair of straps down the back attached one on each side of said spring-button to said first strap, eyelets at the four free ends of said straps, buckles by which said straps are adjustable in length, an entirely separate cord freely disposed through said eyelets on each side of the place of separation, having means for attaching the same to the garment to be supported.

REISSUES.

12,001. CENTRIFUGAL PUMP. WILLIAM S. SHARF, Chicago, Ill., assignor to John D. Ross and Everett W. Brooks, Chicago, Ill. Filed Jan. 12, 1902. Serial No. 20,000. Original No. 244,475, dated Feb. 27, 1900.

Claim.—1. In a centrifugal pump, the combination of a suitable casing, a hollow rotary piston arranged therein, having peripheral walls internally and externally substantially circular and concentric with the axis of rotation of the piston, discharge-outlets at the periphery of said piston, of restricted size, one or more internal pallet-blades extending radially, and an axial inlet, said discharge-outlets being distributed over a zone of greater width than one-half the diameter of the inlet.

2. In a centrifugal pump, the combination of an outer casing, a rotatable piston-shaft arranged in axial through one of the end walls of said casing, a hollow cylindrical rotary piston supported upon said shaft within said casing, a discharge-passage in said casing, an inlet-passage

extending through that end of the casing opposite that through which the rotary shaft enters, said hollow piston being provided with an axial inlet arranged to register with, and contiguous to, the inner end of said inlet-passage of the casing, a longitudinally and diametrically disposed partition within said hollow piston constituting pallet-blades and a plurality of peripheral outlet-passages of restricted size extending through the side walls of said piston, said outlet-passages being arranged to extend over a zone of an axial length not less than one-half the diameter of the inlet, substantially as described.

3. In a centrifugal pump, a hollow rotary piston having an axial inlet, one or more pallet members and peripheral outlets distributed or extending over an axial length of the piston substantially comprehending the resultant divergent angles of delivery of the liquid induced by the impelling forces.

4. In a centrifugal pump, a hollow rotary piston having an axial inlet, one or more pallet members and peripheral outlets distributed or extending over the axial length of the piston substantially comprehending the resultant divergent angles of delivery of the liquid induced by the impelling forces, the total area of discharge of the piston being less than the inlet area thereof, for the purposes set forth.

5. In a centrifugal pump, a hollow rotary piston having an axial inlet, one or more pallet members and peripheral outlets, the end wall of the piston opposite said inlet being located substantially out of range of the resultant lines of delivery of the liquid induced by the impelling forces.

6. In a centrifugal pump, a hollow rotary piston having an axial inlet, one or more pallet members and peripheral outlets distributed or extending over an axial length of the piston substantially comprehending the resultant divergent angles of delivery of the liquid induced by the impelling forces and provided with a closed end wall opposite the axial inlet and located substantially out of range of said resultant angles of delivery.

7. In a centrifugal pump, a hollow rotary piston having an axial inlet, one or more pallet members moving with the piston, peripheral outlets distributed or extending over an axial length of the piston substantially comprehending the resultant divergent angles of delivery of the liquid induced by the impelling forces and unguided and a closed end wall opposite the axial inlet of the piston located sufficiently remote from said inlet to be substantially out of range of the resultant lines of delivery of the pump, the total area of discharge of the piston being much less than the total area of inlet, as and for the purposes set forth.

8. In a centrifugal pump, a hollow rotary piston having an axial inlet, one or more pallet members inside of and rotating with the piston, and peripheral outlets, the axial length of said piston and its diameter at the delivery zone bearing such relation to each other that the mass of the resultant of delivery of the liquid induced by the impelling forces passes through said delivery zone.

9. In a centrifugal pump, a hollow rotary piston provided with peripheral outlets and an inlet the mean of the area of which is relatively nearer the axis of rotation of the piston than said peripheral outlets; one or more pallet members inside of and rotating with the piston and means for rotating the piston, the axial length of said piston and its diameter at the delivery zone bearing such relation to each other that the mass of delivery of the liquid induced by the impelling forces passes through said delivery zone and said zone of delivery being of a width considered longitudinally, to substantially comprehend said resultant angles of delivery.

10. In a centrifugal pump, a hollow rotary piston provided with an axial inlet and peripheral outlets and an axial extension pallet member extending into the inlet-pipe beyond the main body of the piston having its plane substantially parallel with the axis of rotation of the piston, where-

by an effective relative movement is imparted to the following column of liquid before it comes within the path of said extension pallet member.

11. In a centrifugal pump, a piston provided with an axial end inlet, one or more internal pallet members and peripheral outlets distributed or extending over a delivery zone wider, measured longitudinally of the piston, than one-half the mean diameter of the inlet thereof.

12. In a centrifugal pump, a hollow rotary piston having an axial end inlet, one or more pallet members inside of and rotating with the piston and delivery outlets more remote radially from the axis of rotation of the pump than the inlet thereof, said outlets extending over a delivery zone wider than one-half the mean diameter of the inlet.

13. The combination of the vertical casing a, provided with an outlet d, base b having a central opening, and a neck c, with a revolving perforated cylinder f having a neck i and a partition k extending into the neck, substantially as described.

14. The combination of the vertical casing a having a base b, neck c, and a cap e provided with a stuffing-box on its under side and a bearing formed in an extension of said cap e with a revolving perforated cylinder having a neck i and a partition k attached to one of said necks and embracing the other, substantially as described.

15. The combination in a centrifugal pump, of the vertical casing a having a suction-pipe c, discharge-pipe d, cap e and neck c, with the vertical shaft f running in said cap, the adjustable collar g mounted on said shaft, the perforated revolving vertical cylinder carried thereby having a partition k, a neck i surrounding the inlet into the cylinder and a band n fast on said neck i and loosely inclosing the neck c, all substantially as described and shown.

DESIGNS.

85,958. RECEPTACLE. BEN. GOSMAN, Wallingford, Conn., assignor to International Silver Co., Meriden, Conn., a Corporation of New Jersey. Filed May 2, 1902. Serial No. 100,712. Term of patent 7 years.

Claim.—The design for a receptacle as herein shown and described.

85,954. STOVE. WILLIAM V. ROBINSON, Detroit, Mich., assignor to Art Stove Company, Detroit, Mich., a Corporation of Michigan. Filed Dec. 26, 1901. Serial No. 67,864. Term of patent 7 years.

Claim.—The design for a stove, substantially as herein shown and described.

85,955. COOKING STOVE OR RANGE. FRANK J. FERT, Quincy, Ill., assignor to Davis & Tarbush, Quincy, Ill., a Firm. Filed May 10, 1902. Serial No. 100,107. Term of patent 3 1/2 years.

Claim.—The design for a cooking stove or range substantially as herein described and shown.

85,956. DRESSING-CABINET. JAMES C. TAYLOR, Toronto, Canada. Filed Dec. 3, 1901. Serial No. 94,991. Term of patent 34 years.

Claim.—The design for the dressing-cabinet herein shown and described.

85,957. BELT-BUCKLE. LOUIS E. FRANK, Brooklyn, N. Y. Filed May 13, 1902. Serial No. 107,800. Term of patent 7 years.

Claim.—The design for a belt-buckle herein shown and described.

85,958. PORTRAIT CUSHION-COVER. EVELLA SOLOMON, Philadelphia, Pa. Filed Apr. 7, 1902. Serial No. 101,800. Term of patent 34 years.

Claim.—The design for a portrait cushion-cover, substantially as shown and described.

85,959. CASKET-TRIMMING. EDWARD E. SARGENT, New Haven, Conn., assignor to Sargent and Company, New Haven, Conn., a Corporation of Connecticut. Filed May 13, 1902. Serial No. 100,113. Term of patent 34 years.

85,959.

Claim.—The design for a casket-trimming, as herein shown and described.

85,960. WOVEN FABRIC. JOHN WILLIAM LANGENBERGER, Philadelphia, Pa. Filed May 13, 1902. Serial No. 107,800. Term of patent 34 years.

Claim.—The design for a woven fabric as herein shown and described.

85,961. WOVEN FABRIC. JOHN WILLIAM LANGENBERGER, Philadelphia, Pa. Filed May 13, 1902. Serial No. 107,807. Term of patent 34 years.

Claim.—The design for a woven fabric, as herein shown and described.

85,962. DIE OR SIMILAR ARTICLE. HOMER D. GALT, Syracuse, N. Y. Filed Apr. 30, 1902. Serial No. 100,400. Term of patent 14 years.

Claim.—The design for a die, or similar article herein shown and described.

TRADE-MARKS

REGISTERED JUNE 17, 1902.

88,448. BOOTS AND SHOES. CHAS. BARNES, Haverhill and Boston, Mass. Filed May 1, 1902.

The words "THE MCKINLEY," associated with the portrait of William McKinley, late President of the United States, the portrait being ornamented by a sheaf of wheat, partly surrounding the same and extending upwardly therefrom, all being surrounded by an ornamental scrollwork. Used since April 20, 1902.

88,449. BOOTS AND SHOES. BARNES, JOHNSON & RAND SHOE CO., St. Louis, Mo. Filed May 6, 1902.

OUR FAMILY

The words "OUR FAMILY." Used since January 1, 1902.

88,450. BOOTS AND SHOES. BARNES, JOHNSON & RAND SHOE CO., St. Louis, Mo. Filed May 6, 1902.

PLANET

The word "PLANET." Used since January 1, 1902.

88,451. BOOTS AND SHOES. BARNES, JOHNSON & RAND SHOE CO., St. Louis, Mo. Filed May 6, 1902.

PATRIOT

The word "PATRIOT." Used since March 1, 1902.

88,452. SHIRTS, COLLARS, CUFFS, SHIRT-WAISTS, NIGHT SHIRTS, PAJAMAS, AND BATH-ROBES. CLINT, FRANKS & CO., Troy, N. Y. Filed May 12, 1902.

Arched

The word "MONARCH." Used since 1874.

88,453. DRILLINGS AND SHEETING. GEORGE L. MONTGOMERY, New York, N. Y. Filed May 10, 1902.

The representation of a head of a Rocky Mountain sheep or goat with large curved horns. Used since November, 1901.

88,454. BOOKBINDING. THOMAS RICHARD TOWLER, South Woodford, England. Filed Apr. 23, 1902.

AKORDEGA

The word "AKORDEGA." Used since November 18, 1901.

88,455. FINGER-RINGS. CLINT & BARTON COMPANY, Providence, R. I. Filed Feb. 24, 1902.

The letters "O B" within an eight-sided panel, the numeral "14" within a similar eight-sided panel, and three crosses arranged in a pyramidal group between said two panels. Used since February 14, 1902.

88,456. MOUTH-HARMONICAR. FIRM OF M. HONNER, Tremsin, Germany, and New York, N. Y. Filed May 10, 1902.

3CND

The symbol "3 C N D." Used since 1867.

88,457. MOUTH-HARMONICAR. FIRM OF M. HONNER, Tremsin, Germany, and New York, N. Y. Filed May 10, 1902.

34B

The symbol "34 B." Used since 1872.

88,458. MOUTH-HARMONICAR. FIRM OF M. HONNER, Tremsin, Germany, and New York, N. Y. Filed May 10, 1902.

1816

The numeral "1816." Used since 1899.

88,459. MOUTH-HARMONICAR. FIRM OF M. HONNER, Tremsin, Germany, and New York, N. Y. Filed May 10, 1902.

1896

The numeral "1896." Used since 1896.

88,460. MOUTH-HARMONICAR. FIRM OF M. HONNER, Tremsin, Germany, and New York, N. Y. Filed May 10, 1902.

50B

The symbol "50 B." Used since 1877.

88,461. MATCH-SAFES. CHARLES C. FITZ, Brockton, Mass. Filed May 13, 1902.

STAR

The word "STAR." Used since January 1, 1902.

88,462. CERTAIN NAMED BRUSHES. LEOPOLD ACHER, COMPANY, New York, N. Y. Filed Apr. 24, 1902.

CENTURY

The word "CENTURY." Used since December, 1899.

88,463. MINOCULARS. EMILIE COLMONT, Paris, France. Filed Feb. 14, 1902.

The word "IRIS," arranged within a border-line which also incloses a cross. Used since December 2, 1901.

88,464. NEEDLES FOR VACCINATING ANIMALS. OSMER, THOMAS, Paris, France. Filed May 14, 1902.

The letters "OT," one of which is superimposed on the other. Used since February 1, 1902.

88,465. CERTAIN NAMED VETERINARY SANDWICHES. JAMES T. AMMONS, Chicago, Ill. Filed May 2, 1902.

The representation of a horse's head, a horseshoe, and the letters "I. X. L." Used since March 10, 1902.

88,466. MEDICINAL HERB COMPOUND. WILLIAM H. ELDER, Chicago, Ill. Filed Mar. 4, 1902.

The words "ELECTRICITY TEA" in ornamental letters, with zig-zag lines radiating in all directions from each letter. Used since November, 1902.

88,467. CERTAIN NAMED MEDICINAL PREPARATION. CHERRY CHEMICAL CO., Richmond, Va. Filed May 2, 1902.

Vagicura

The word "VAGICURA." Used since February, 1902.

88,468. REMEDIES FOR CERTAIN NAMED DISEASES. WILLIAM E. BROWNELL, New Bedford, Mass. Filed May 7, 1902.

GASTROIDS.

The word "GASTROIDS." Used since January, 1902.

88,469. REMEDIES FOR CERTAIN NAMED DISEASES. GEORGE W. CALDWELL, Middletown, N. Y. Filed Mar. 18, 1902.

The word "FEMITONE" and the representation of a shield. Used since February 24, 1902.

88,470. MEDICINE FOR INFLAMMATORY DISEASES. CHARLES SYLVESTER HARRIS, Dayton, Ohio. Filed May 3, 1902.

ANTI-ITIS

The compound word "ANTI-ITIS." Used since June 1, 1901.

88,471. MEDICINAL PREPARATIONS FOR THE CURE OF CERTAIN NAMED DISEASES. DR. FREDERICK C. O'NEILL, New Haven, Conn. Filed Jan. 25, 1902.

A monogram of the letters "D F N" within a circle. Used since January 1, 1901.

88,472. CERTAIN NAMED FOOD, RELIGIOUS, AND MEDICINAL PREPARATIONS. CO-OPER COMPANY OF AMERICA, Chicago, Ill. Filed Apr. 18, 1902.

A. Denaver

The signature "A. DENAVER." Used since May, 1902.

88,473. CHEWING AND SMOKING TOBACCO. ELLSWORTH E. WILSON, Columbus, Ohio. Filed May 8, 1902.

RED OX

The words "RED OX," associated with a pictorial representation of an ox. Used since April 21, 1902.

88,474. NATURAL MINERAL WATER AND CARBONATED BEVERAGE. JOHN H. FETTERSON, Crookston, Minn. Filed Mar. 19, 1902.

A triangular-shaped figure having the representation of a flowing spring arranged thereon and surrounded by concentric circles. Used since February 1, 1902.

88,475. CERTAIN NAMED GROCERS' SUPPLIES. S. J. VALE & SONS, New York, N. Y. Filed Apr. 26, 1902.

FALCON

The word "FALCON." Used since July, 1899.

88,476. SYRUPS, CEREALS, COFFEE, BAKING-POWDER, AND CANNED VEGETABLES. I. R. HOWARD & CO., Richmond, Ind. Filed May 5, 1902.

GOLDEN RUSSET

The words "GOLDEN RUSSET." Used since April, 1902.

88,456. MOUTH-HARMONICAR. FIRM OF H. HOFER, Trossen-
gen, Germany, and New York, N. Y. Filed May 10, 1902.

3CND

The symbol "3 CND." Used since 1897.

88,457. MOUTH-HARMONICAR. FIRM OF H. HOFER, Trossen-
gen, Germany, and New York, N. Y. Filed May 10, 1902.

34B

The symbol "34 B." Used since 1872.

88,458. MOUTH-HARMONICAR. FIRM OF H. HOFER, Trossen-
gen, Germany, and New York, N. Y. Filed May 10, 1902.

1816

The numeral "1816." Used since 1899.

88,459. MOUTH-HARMONICAR. FIRM OF H. HOFER, Trossen-
gen, Germany, and New York, N. Y. Filed May 10, 1902.

1896

The numeral "1896." Used since 1896.

88,460. MOUTH-HARMONICAR. FIRM OF H. HOFER, Trossen-
gen, Germany, and New York, N. Y. Filed May 10, 1902.

50B

The symbol "50 B." Used since 1877.

88,461. MATCH-SAFES. CHARLES C. FIFE, BROOKTON, MASS. Filed
May 12, 1902.

STAR

The word "STAR." Used since January 1, 1902.

88,462. CERTAIN NAMED DRUGS. LEONARD ASHES, CUM-
PANY, NEW YORK, N. Y. Filed Apr. 24, 1902.

CENTURY

The word "CENTURY." Used since December, 1899.

88,463. BINOCULARS. BRILLER COLBERT, PARIS, FRANCE. Filed
Feb. 14, 1902.

The word "IRIS," arranged within a border-line which also incloses
a star. Used since December 2, 1901.

88,464. NEEDLES FOR VACCINATING ANIMALS. OUTHEN
THOMAS, PARIS, FRANCE. Filed May 14, 1902.

The letters "O.T." one of which is superimposed on the other. Used
since February 1, 1902.

88,465. CERTAIN NAMED VETERINARY BANDAGES. JAMES
T. ANTHONY, CHICAGO, ILL. Filed May 2, 1902.

The representation of a horse's head, a horseshoe, and the letters
"I. X. L." Used since March 10, 1892.

88,466. MEDICINAL HERB COMPOUND. WILLIAM E. BAKER,
CHICAGO, ILL. Filed Mar. 4, 1902.

The words "ELECTRICITY TEA" in ornamental letters, with sig-
ning lines radiating in all directions from each letter. Used since Novem-
ber, 1892.

88,467. CERTAIN NAMED MEDICINAL PREPARATION. OWENS
CHEMICAL CO., RICHMOND, VA. Filed May 2, 1902.

Vagicura

The word "VAGICURA." Used since February, 1902.

88,468. REMEDIES FOR CERTAIN NAMED DISEASES. WIL-
LIAM E. BAKER, NEW BEDFORD, MASS. Filed May 7, 1902.

GASTROIDS.

The word "GASTROIDS." Used since January, 1902.

88,469. REMEDIES FOR CERTAIN NAMED DISEASES. GEORGE
W. GILFILLAN, MADISON, N. Y. Filed Mar. 12, 1902.

The word "FEMITONS" and the representation of a shield. Used
since February 24, 1902.

88,470. REMEDIES FOR INFLAMMATORY DISEASES. CHARLES
SILVERMAN, BOSTON, MASS. Filed May 2, 1902.

ANTI-ITIS

The compound word "ANTI-ITIS." Used since June 1, 1901.

88,471. MEDICINAL PREPARATIONS FOR THE CURE OF CER-
TAIN NAMED DISEASES. DR. FORTY CHEMICAL CO., NEW HAVEN, CONN.
Filed Jan. 20, 1902.

A monogram of the letters "D F N D" within a circle. Used since
January 1, 1901.

88,472. CERTAIN NAMED FOOD, RELIEF, AND MEDICINAL
PREPARATIONS. OX-BEE COMPANY OF AMERICA, CHICAGO, ILL. Filed
Apr. 18, 1902.

A. Dewar

The signature "A. DEWARTER." Used since May, 1902.

88,473. CHEWING AND SMOKING TOBACCO. ELIZABETH E. WIL-
KINSON, COLUMBUS, OHIO. Filed May 2, 1902.

RED OX

The words "RED OX," associated with a pictorial representation
of an ox. Used since April 21, 1902.

88,474. NATURAL MINERAL WATER AND CARBONATED BEV-
ERAGES. JOHN E. FETTERSON, CROCHTON, MINN. Filed Mar. 10, 1902.

A triangular-shaped figure having the representation of a flowing
spring arranged thereon and surrounded by concentric circles. Used
since February 1, 1902.

88,475. CERTAIN NAMED GROCERY SUPPLIES. R. J. VALL &
SON, NEW YORK, N. Y. Filed Apr. 20, 1902.

FALCON

The word "FALCON." Used since July, 1890.

88,476. SYRUPS, GERRALS, COFFEE, BAKING-POWDER, AND
CANNED VEGETABLES. I. R. HOWARD & CO., RICHMOND, IND. Filed
May 2, 1902.

GOLDEN RUSSET

The words "GOLDEN RUSSET." Used since April, 1890.

88,477. MEAL AND FLOUR OF CORN, WHEAT, OATS, AND OTHER CEREALS. ANDERSON & BARROW, Chicago, Ill. Filed Apr. 11, 1902.

NUTRI

The word "NUTRI." Used since March 15, 1902.

88,478. WHEAT-FLOUR. ELIAS HIND, (Incorporated in Connecticut.) Havana, Cuba. Filed Apr. 23, 1902.

The words "PALMA REAL," associated with a pictorial representation of a palm tree or royal palm. Used since September, 1901.

88,479. CRACKERS AND BISCUITS. C. R. Bess & Son, New London, Conn. Filed May 8, 1902.

UNIQUE

The word "UNIQUE." Used since April 1, 1902.

88,480. CERTAIN NAMED PACKING-HOUSE PRODUCTS. SWIFT AND COMPANY, Chicago, Ill. Filed May 17, 1902.

SILVER LEAF

The words "SILVER LEAF" and the representation of two silver leaves. Used since 1890.

88,481. LIQUID PREPARATIONS FOR TREATMENT OF THE SKIN. GREAT CENTURY PHARMACEUTICAL CO., LONDON, ENGLAND. Filed Feb. 6, 1902.

The pictorial representation of a bearded man seated in a chair, with one foot on a stool and one arm resting on a table on which is a bottle and box, and above the man is the figure of an angel and a cherub holding in outstretched hands a box on which appear the words "GREAT CENTURY." Used since April 10, 1901.

88,482. TOILET ORNAMENT. WILLIAM SMITH HENSON, York, Pa. Filed Mar. 18, 1902.

The word "NODOR" on a tilted background, surrounded by an ornamental border or scroll. Used since January 1, 1902.

88,483. PERFUMERY. J. & R. ATTENBORO, LONDON, ENGLAND. Filed May 8, 1902.

EONIA

The word "EONIA." Used since March 21, 1902.

88,484. LAUNDRY AND TOILET SOAP. THE E. E. FAIRBANK COMPANY, Chicago, Ill. Filed Apr. 24, 1902.

BLUE CLOUD

The words "BLUE CLOUD." Used since November 6, 1901.

88,485. SOAP. THE MANUFACTURING COMPANY, ALTON, ILL. Filed Apr. 17, 1902.

EZO

The word "EZO." Used since April 12, 1902.

88,486. SOAP AND SHAVE POLISH. E. E. STUBBS & CO., BUFFALO, N. Y. Filed Mar. 28, 1902.

The words "BLACK CAT" and the representation of the head of a black cat within an inclosing circular figure. Used since March 15, 1902.

88,487. PRESERVATIVE, DISINFECTANT, AND TANNING OR TAWING COMPOUNDS. THOMAS TRAVERS, DARTFORD, ENGLAND. Filed May 8, 1902.

The representation of the male figure of a man, with his arms supported upon his hips, and bearing upon his back and shoulders a globe according to the conventional representation of the figure of Atlas supporting the world. Used since 1890.

88,488. PRESERVATIVE, DISINFECTANT, AND TANNING OR TAWING COMPOUNDS. THOMAS TRAVERS, DARTFORD, ENGLAND. Filed May 8, 1902.

ATLAS

The word "ATLAS." Used since 1890.

88,489. METAL-POLISH. A. BALLOU & CO., LTD., NEW ORLEANS, LA. Filed Mar. 27, 1902.

The representation of a human hand grasping and holding aloft a brush. Used since March 19, 1902.

88,490. PAINT FOR METAL SURFACES. THE CRIMINAL PAINT MANUFACTURING CO., HANFORD, CONN. Filed Apr. 14, 1902.

The representation of a barrel having thereon a monogram of the letters "O.F.O." Used since December 26, 1901.

88,491. CHINA-WOOD OIL AND CITRONELLA-OIL. EDWARD HALL'S SON & CO., NEW YORK, N. Y. Filed Apr. 4, 1902.

The words "DOUBLE STAR" and the representation of two stars, each formed of two superposed equilateral triangles. Used since 1891.

88,492. MINERAL-BEARING SANDS AND ORBS. JOHN H. CHAPMAN, NEW YORK, N. Y. Filed May 10, 1902.

INDURITE

The word "INDURITE." Used since April 21, 1902.

JUNE 17, 1902.

88,498. CERTAIN MARKED RECTANGULAR. HENRY E. WILSON. 88,495. RANGER. HENRY E. WILSON, Pittsburg, Pa. Filed Apr. 12, 1902.

E-Z

The hyphenated letters "E-Z." Used since December 1, 1901.

88,494. CERTAIN MARKED HEATING APPARATUS AND THERMAL APPARATUS. THE EAST REGULATING VALVE CO., Detroit, Mich. Filed Apr. 10, 1902.

The monogram "N E V Co." Used since January 1, 1902.

ACME

The word "ACME." Used since January 1, 1902.

88,496. STEAM FIRE-ENGINE. AMERICAN FIRE ENGINE COMPANY, Garden City, N. Y. Filed May 7, 1902.

**COSMO
POLITAN**

The word "COSMOPOLITAN." Used since March 1, 1902.

DECISIONS
OF THE
COMMISSIONER OF PATENTS
AND OF
UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

BLACKFORD v. WILDER.

Decided December 15, 1897.

1. INTERFERENCE—PRIORITY—EXHIBIT—REDUCTION TO PRACTICE.

Where a certain exhibit contains a chamber as a material part thereof, which is so connected and associated with the other parts that it would probably have a material effect upon the operation of the device, *Held* that this chamber cannot be ignored in order that the exhibit may be considered as a reduction to practice.

2. SAME—SAME—SAME.

Where B. contends that a certain exhibit if operated at this time would contain oil in the trough and that therefore it must be held that it contained oil in 1896 when operated, *Held* that a demonstration of the burner at this time even if satisfactory would not be sufficient, since B. should have shown by his proofs that it did contain oil and that he appreciated the fact at the time. It is not sufficient that he supposes now that an operation took place which he did not appreciate at the time.

APPEAL from Examiners-in-Chief.

OIL-TROUGHS.

Application of Atwell J. Blackford filed August 23, 1897, No. 649,311. Application of William H. Wilder filed January 4, 1899, No. 701,100.

Messrs. Pattison & Nesbitt and Mr. A. S. Pattison for Blackford.

Messrs. Walter Donaldson & Co. for Wilder.

ALLEN, Commissioner:

This is an appeal by Wilder from the decision of the Examiners-in-Chief affirming the decision of the Examiner of Interferences awarding priority of invention to Blackford upon the following issue:

1. Is a burner the combination with a trough and perforated tubes situated thereabove and forming a combustion-chamber, said trough having at its bottom a liquid-containing portion, and an enlarged upper vapor-receiving space, and a vertically-disposed lighting member seated in the liquid-containing portion and extending upward between the walls of the enlarged vapor-receiving portion to form a vapor-space at the side of the lighting member.

2. In a burner the combination of a trough and perforated tubes situated thereabove and forming a combustion-chamber, a lighting member vertically disposed between the upwardly-disposed walls of the trough, said trough having a contracted lower portion in which the lighting member is seated, and a vapor-space above the contracted portion at the side of the vertically-disposed lighting member.

3. In a burner the combination of a trough and perforated tubes situated thereabove and forming a combustion-chamber, said trough being contracted at its lower portion, and a vertically-disposed lighting member seated in said contracted portion and extending upward between the upwardly-disposed walls and constituting a vapor-space in the upper portion of the trough at the side of the said lighting member.

4. In a burner the combination of a trough and perforated tubes situated thereabove and forming a combustion-chamber, said trough being contracted at its lower portion and being provided with a wick seated in the contracted portion of the trough

and extending upwardly between and distant from its upwardly-disposed walls.

An examination of all of the evidence in this case shows that the decision must turn upon the proof in regard to four exhibits introduced in evidence, two on behalf of each party. These exhibits are A and D on behalf of Blackford and E and F on behalf of Wilder. No serious contention can be made that any other exhibit made prior to the date of Wilder's application embodies the invention. Each party claims to have conceived the invention some time before the date of these exhibits; but there is no proof of that conception, and in so far as the proof goes the first disclosure of the invention must be taken as the date when one of these exhibits was made embodying the invention. The alleged dates upon which these exhibits were made are: Blackford's Exhibit A, February, 1896; Blackford's Exhibit D, November, 1896; Wilder's Exhibit E, April, 1896; Wilder's Exhibit D, January, 1897. Wilder alleges that stoves like his Exhibit D were put on the market in January, 1897, and that their manufacture was begun six months earlier.

The evidence satisfactorily establishes the fact that Blackford's Exhibit A was made in February, 1896, as alleged, and holding it to be a reduction to practice of the invention in controversy the Examiner of Interferences awarded priority of invention to Blackford upon the strength of this exhibit alone. The Board of Examiners-in-Chief were unanimously of the opinion that this exhibit did not embody the invention and could not be accepted as evidence even of conception. The majority were of the opinion also that Wilder's Exhibit E, made in April, 1896, did not show a conception and that Blackford's Exhibit D was made, as alleged, in November, 1896, and constituted a reduction to practice of the invention at that date. They therefore awarded priority to Blackford, basing their decision upon Exhibit D. One member of the Board in a dissenting opinion states that Wilder's Exhibit E, while not proved to be a successful reduction to practice, is proof of conception in April, 1896, and that the evidence does not establish that Blackford's Exhibit D was made in November, 1896, or at any time before Wilder's filing date, or that when made it constituted a reduction to practice of the invention. He was therefore of the opinion that Wilder is the prior inventor.

It will therefore be seen that the two Examiners-

in-Chief, constituting the majority of the Board, are the only ones passing upon this case who have agreed in their findings of the material facts upon which the decision turns.

In order to determine whether the exhibits and the evidence in regard to them come within the issue, it is necessary to know just what the invention in controversy is. The invention is an improvement upon the old and well-known class of burners in which the vapor from oil is burned with a blue flame between vertical, parallel, perforated walls or tubes. In such burners the vapor rises from a trough or receptacle at the lower end of the space between the walls or tubes. In the oldest types the oil was supplied to the lower end of the tubes by the capillary action of a wick from a reservoir beneath, and in later types it was supplied by a pipe directly to a trough at the bottom of the tubes without any wick, and in this form the heat was such that all oil was vaporized, and in normal operation there was no oil, but only vapor in the trough. It is considered by these applicants as desirable to have oil in the trough during the normal operation of the burner, so that the vapor will be produced and burn from the surface of this oil; but the trough will not become so highly heated in operation as to vaporize all of the oil contained in it. It is to this end and with this purpose in view that a trough of the particular construction of the issue was designed, and it was because of this apparently new operation that claims to that construction were allowed. The novelty is in the trough, which will not vaporize all oil supplied to it, all other parts of the burner being the same as in the old-style vapor-burner.

The essential features of this trough are a lower contracted portion, an upper expanded portion, and a lighting member, usually of asbestos, seated in the contracted portion, which forms an oil-space, and extending into the expanded portion above, leaving a vapor-space between it and the walls of the expanded portion. It seems that the lower contracted portion does not become so highly heated as to vaporize the oil as fast as it is supplied. It seems probable that the operation is influenced to a certain extent by the thickness of the material used in making the trough; but this is a feature not specified in the issue. A thin trough would not retain as much heat as a thicker one.

Blackford's application discloses a trough V-shaped in cross-section, and Wilder's application discloses one which is not a true V shape in that below the expanded portion the walls of the contracted portion are parallel and the lighting member fills the space between them. Each party shows his trough as made of thin material, and the operation in so far as the burning of the oil from its surface is concerned is the same in both cases. The lighting member is simply a means for starting the burner and is intended to perform no material function when the burner is in normal operation.

Blackford's Exhibit A consists of a comparatively wide bottom trough, rectangular in cross-

section, made of cast metal and having a partition placed in it extending from near the top on one side to the bottom near the other side, thus dividing the trough into an open channel narrow at its bottom and a closed chamber. The oil is supplied to the closed chamber and is admitted to the open channel through perforations made in the lower part of the partition for that purpose. It seems that a starter or wick was placed in the open channel in use, and it is contended on behalf of Blackford that this open channel conforms to the requirements of the issue and that the exhibit was a reduction to practice of the invention in controversy. To reach this conclusion, however, would make it necessary to ignore the surrounding closed chamber, which is a material part of the exhibit. This chamber cannot be ignored as if it were a separate and independent feature the presence or absence of which would not affect the other parts, since it is so connected and associated with the channel that it would probably have a material effect upon the operation. Its presence was sufficient to make it incumbent upon Blackford to show by his proofs that it was intended to and did, in fact, have the operation which is the foundation for the claims of the issue. It is not a V-shaped trough alone, but one which will operate as desired with oil in the trough in normal operation, which constitutes the invention in controversy. None of the witnesses testify that Exhibit A did operate in that way, could operate in that way, or was intended to operate in that way. Blackford himself fails to state that this operation was intended or accomplished by it. The evidence falls entirely to show that at the time that this exhibit was made, in February, 1896, Blackford had any conception of the result to be accomplished by this invention or of the means for accomplishing it. His subsequent conduct indicates that he had no such conception, for he next made Exhibit H, which belonged to the old style of trough, which admittedly did not contain oil, but burned vapor.

Under the circumstances it would be unwarrantable to presume, in the absence of testimony, that Exhibit A embodied the invention and that Blackford had a conception of it at that time.

Blackford contends that Exhibit A if operated at this time would contain oil in the trough and that therefore it must be held that it contained oil in 1896 when operated. A demonstration of the burner at this time even if satisfactory would not be sufficient. Blackford should have shown by his proofs that it did contain oil and that he appreciated the fact at the time, for otherwise neither Blackford nor the public would have been any wiser because of the use of Exhibit A in February, 1896, if nothing further had been done toward making the present invention. It is not sufficient that he supposes now that an operation took place which he did not appreciate at the time. He apparently did not regard the form of Exhibit A as satisfactory, for he made no more like it, but proceeded upon other lines with the old vapor-burners, and it was not until November, 1896, that

he claims to have made another burner upon the lines of the invention in issue, and it was radically different in construction from Exhibit A. The trough Exhibit D, said to have been made in November, 1896, is V-shaped in cross-section and of thin metal.

The evidence in regard to when Exhibit D was made is not as clear and explicit as it should have been; but the testimony of Blackford, Possons, and Humitch, taken together, makes it seem probable that it was some time in the fall of 1896. There is no testimony that the trough of this exhibit contained oil when in operation; but it seems probable from its construction, which is similar to that shown in Blackford's application, that it would.

Blackford states that the operation of Exhibit D was considered a success, (Q. 66,) and Possons states that it was an operative burner (Q. 33) and burned "with a blue flame and with good combustion." (Q. 32.) Humitch says on cross-examination that he saw it operate, but fails to state the result of that operation. Blackford claims to have put burners like Exhibit D on the market in the fall of 1897, one year after its alleged construction, and in the meantime seems to have done nothing of any importance in regard to the invention. His excuse for this delay is that he had a large sale then for the wick-stove and did not believe that the trade was ready for a wickless stove. (Q. 77.) This excuse is not sufficient to overcome the presumption raised by his delay and inaction that Exhibit D was not satisfactory, particularly in view of his own admission that there were defects in the apparatus as then used. In his answer to Question 77 he says, further, as an additional reason for the delay:

* * * The trouble, heretofore, with burners of that description was, to be able to feed the oil through the channel-cup regularly so that it could stand an even fire for a considerable length of time. This led to a great many different ideas in the way of valves, which we made and improved on before we could get one that would feed regularly. Also another trouble with the wickless valve-stove was the leaking of all joints. * * *

Exhibit D may have worked in a certain sense and probably did, as stated by the witnesses; but it does not follow that it demonstrated the practicability of the invention so as to satisfy the parties, as is necessary to a reduction to practice. Any kind of a trough or receptacle to which oil was supplied at the lower end of the perforated tubes would probably produce a blue flame, as described by the witnesses, and the mere statement that there was such operation is not sufficient to overcome the presumption, that the device was not satisfactory, raised by the subsequent action of Blackford.

In explaining what led to his invention in this case Wilder says that from 1891 to the fall of 1896 his company was manufacturing the old-style vapor-burners under certain patents, and because of certain transfers of the patents at that time the manufacture had to be discontinued. In order to continue the business and at the same time avoid those patents, he bent his efforts to designing a burner which would have oil in the trough in normal operation instead of vapor, and to this end

made Exhibit E in April, 1896. (Q. 45 and Q. 60.) According to his statement, therefore, he had the essential idea of this invention in mind when he made Exhibit E and worked with that end in view. Thompson, H. P. Wilder, and Brooks corroborate him as to the making of Exhibit E in April, 1896, and the fact is well established. Exhibit E consists of a V-shaped trough essentially like that shown in Blackford's application. If the ordinary lighting member shown in the other exhibits is placed in this trough and the ordinary combustion-tubes are used above, every element of the issue is present. There is no question but that the combustion-tubes were intended to be and were, in fact, used with it; but a question is raised as to the lighting member. There is no lighting member in the exhibit now, and the testimony upon that point is not very full; but it is obvious upon mere inspection that there must have been a lighting member when the device was used, for it is well understood by those familiar with this art that a lighting member is necessary to start the operation of a burner of this kind. It was probably because of this knowledge that more specific testimony on this point was not produced. The witness Brooks does state, however, that a piece of asbestos was used in the bowl as a starter. (Q. 388.) Brooks states that oil remained in the trough and burned from the surface, (Q. 328,) and H. P. Wilder refers to the device as an oil-burner as distinguished from a vapor-burner.

It is believed that the evidence in regard to the making of Exhibit E shows more clearly a conception of this invention by Wilder than does the making of Exhibit D by Blackford. If D is effective for Blackford, E must be held to be equally effective for Wilder. This being true, Wilder is the first to conceive and the first to reduce to practice and is therefore the first inventor.

Wilder and some of his witnesses claim that the construction of stoves like Exhibit D, which was ready for the market in January, 1897, and which admittedly embodies the invention, was begun in the fall of 1896; but in view of the conclusion announced above it is unnecessary to here consider that matter.

The decision of the Examiners-in-Chief is reversed and priority is awarded to Wilder.

SLAUGHTER v. HALLE.

Decided January 16, 1902.

1. INTERFERENCE—PRIORITY—EVIDENCE OF CONCEPTION AND DISCLOSURE.

Where the testimony shows a conception and disclosure of one specific form of the invention, *Held* sufficient to establish a conception and disclosure of the generic invention based upon another specific form.

2. SAME—SAME—REDUCTION TO PRACTICE.

Where one specific form of the invention embodied in a machine is shown to have worked practically and successfully. *Held* to constitute a reduction to practice of the invention notwithstanding the fact that this form is shown to have been capable of improvement. (*Hien v. Buloup*, 81 O. G., 2088.)

3. SAME—SAME.

Where H. was the first to conceive the invention defined in all the counts and the first to reduce the invention to practice

as to all the counts save one and exercised due diligence in reducing to practice the invention defined in the remaining count, Held that priority of invention as to all the counts should be awarded to H.

APPEAL from Examiners-in-Chief.

CARD-CONTROLLING ATTACHMENT FOR TYPE-WRITING MACHINES.

Application of Robert K. Slaughter filed February 26, 1900, No. 6,537. Application of Hiram J. Halle filed October 7, 1899, No. 782,921.

Messrs. Munn & Co. for Slaughter.

Mr. E. G. Siggers for Halle.

ALLEN, Commissioner:

This is an appeal by Halle from the decision of the Examiners-in-Chief awarding priority of invention to Slaughter upon the following issue:

1. In a type-writing machine, the combination with the flat platen and the printing mechanism arranged thereover, of a holder interposed in a plane between the printing mechanism and the writing-surface of the platen, said holder having guiding and holding means for the edges of a card or sheet.

2. In a type-writing machine, the combination with the flat platen, the printing mechanism arranged thereover, and the main tracks or guides for said printing mechanism, of a card or sheet holder interposed in a plane between said main tracks or guides and also in a plane between the printing mechanism and the writing-surface of the platen, said holder having means for engaging opposite edges of a card or sheet.

3. In a type-writing machine, the combination with the flat platen, and the printing mechanism arranged thereover, of work-holding members interposed in a plane between the printing mechanism and the writing-surface of the platen, and disposed in opposite relation, said work-holding members having guiding and holding means for the edges of a card or sheet.

4. In a type-writing machine, the combination with the flat platen and the main tracks or guides for the type-carriage, of work-holding members arranged in a plane between said tracks or guides for the carriage and disposed in opposite relation, said work-holding members having guiding and holding means for the edges of a card or sheet.

5. In a type-writing machine, the combination with the flat platen and the type-carriage supported thereon, of a card or sheet holder comprising guideways for the edges of the card or sheet, the said guideways being disposed at opposite sides of the printing area of the platen and interposed in a plane between the carriage and the writing-surface of the platen.

6. In a type-writing machine the combination with the flat platen and the traveling type-carriage supported thereon, of card-holding guideways arranged to have the carriage travel thereover and located at opposite sides of the printing area of the platen.

7. In a type-writing machine, the combination with the flat platen and the traveling type-carriage supported thereon, of card-holding guideways located at opposite sides of the printing area of the platen below the plane of the type-carriage, and entrance-guides in communication with the front ends of said guideways.

8. In a type-writing machine, the combination with the flat platen and the traveling type-carriage supported thereon, of adjustable card-holding guideways supported upon the writing-surface of the platen, below the plane of the type-carriage and arranged to have the type-carriage travel thereover.

9. In a type-writing machine, the combination with the flat platen and the traveling type-carriage working thereover, of card-holding guideways arranged below the plane of the type-carriage and transversely adjustable with relation to the platen.

10. In a type-writing machine, the combination with the flat platen and the type-carriage supported thereon, of card-holding guides arranged in a plane between the carriage and the platen, and having an individual lateral adjustment.

11. In a type-writing machine, the combination with the flat platen and the traveling type-carriage supported thereon, of separate spaced card-holding guides held upon the writing-surface of the platen, below the plane of the carriage and confining therebetween the printing space or area for the card or sheet.

12. In a type-writing machine, the combination with the flat platen and the type-carriage supported thereon, of spaced card or sheet holding guides applied to the upper side of the platen below the plane of the type-carriage and each provided with a longitudinal guideway, and an entrance-guide in communication with the front end of the guideway.

13. In a type-writing machine, the combination with the flat platen and the type-carriage supported thereon, of spaced card or sheet holding guides applied to the upper side of the platen below the plane of the type-carriage and each provided with a longitudinal guideway, an entrance-guide in communication with the guideway, and a frictional retaining device engaging with the edge of the card or sheet.

14. The combination of a flat platen for type-writing machines, card or sheet holding guides associated with the platen and the type-carriage, and means for causing the printed card or sheet to turn over, face downward, after leaving the holding-guides.

The Examiner of Interferences awarded priority to Halle upon the first thirteen counts of the issue, and the reversal of that decision by the Examiners-

in-Chief was due principally to a difference of opinion as to the meaning of the claims in issue. The Examiners-in-Chief gave those claims a very limited construction, whereas the Examiner of Interferences considered them broader in scope. It is believed that there is nothing in the terms of the claims or the state of the art to render necessary the limited construction given by the Examiners-in-Chief.

The appellant, Halle, alleges conception and disclosure of the first thirteen counts of the issue early in 1897 and has introduced in evidence a sketch, Halle's Exhibit Reproduction of Halle's First Drawing, as illustrating the invention disclosed to others at that time. Mayer and L. G. Halle corroborate him fully as to this disclosure to them in the spring of 1897, and other witnesses, Fisher, Stackpole, and Laganke, testify to a similar disclosure during that year. The fact of the disclosure is well established, and it is earlier in date than Slaughter's invention, since he does not allege conception until December, 1897.

L. G. Halle describes the invention then disclosed to him as follows:

The sheet or card was to be shoved or slid between two arms attached to a rod that lay close to the platen and mounted underneath the rails. When the machine was brought forward and in position for writing, these arms brought the paper in contact with the writing-surface. When the machine was shoved back on the platen to permit of the writing being viewed and the paper removed, these arms were raised and permitted both of the removal of the paper and the insertion of a new sheet. At the first explanation by him I did not completely grasp all the details, until upon inquiry from him he told me that these arms were adjustable on the shaft, to conform to the width of the paper, and that the paper or card was held in the grooved edge of these arms with the addition of a small clip at the entrance of one of them.

Other witnesses give similar descriptions. Comparing this disclosure with count 1 of the issue it is found that every element is present unless that count is construed as limited beyond that which its terms alone would indicate. It includes a holder for the cards, and when the machine is in position for writing the holder is—

in a plane between the printing mechanism and the writing-surface of the platen.

The arms of the holder are furthermore described as provided with grooves to receive the edges of the cards and guide them when they are inserted. The witnesses also state that it was disclosed to them that the holding-arms were to be laterally adjustable, so as to receive cards of different widths, and that there was to be a spring member or frictional device to retain the cards in position in the holder. This includes the structure of all of the first thirteen counts with the exception of counts 7, 12, and 13, which include as an element an entrance-guide at the front end of the guideway. The outer ends of the holding-arms in this first form were described by Halle to the witnesses as cut away at an angle, so as to facilitate the insertion of the cards, and if this construction be regarded as the entrance-guides Halle's disclosure in 1897 shows a conception of the first thirteen counts.

This first form of the invention conceived by Halle differs from the specific improved form shown in the present case, but it is nevertheless one species of the generic invention. It seems

from the evidence that that specific form has been made the subject of another application, and it appears from the present issues that Halle has chosen to make his broad or generic claims in this case. It is believed that a device of this first form would be regarded as an infringement of a patent containing the claims of the present issue. An inspection of Halle's application leaves no room for doubt that he intended them to be of that breadth, and since Slaughter copied them after they were made by Halle their meaning in case of doubt must be determined from Halle's case.

Card-guides to be used in connection with printing-presses and analogous devices were old prior to this invention, and what the Examiner regarded as the invention in this case seems to have been the idea of applying such guides to a type-writer to hold the cards in place rather than the specific form of the guides themselves. Substantially the preferred form shown in this case was old in other relations. The invention was in the attachment to be applied to the platen of a type-writer, and the question whether the guides for the cards were U-shaped grooves in the rods of the attachment or were grooves formed between those rods and the platen is believed to be immaterial to the real invention. For instance, to hold that the use of a device like the one in evidence as Halle's original card-guides was not an infringement of the issue would be to render those claims practically valueless. The specific form of the guide finally adopted was a mere mechanical detail marked out from experience and a knowledge of the art and was entirely outside of the main idea which constituted the principal inventive thought in the case.

It appears from the testimony of Halle and Eckert that Eckert was instructed to build card-guides, and he produced Halle's original card-guides in January, 1899. Stackpole says he saw them in January, and L. J. Halle saw them in March, 1899. This device undoubtedly embodies the invention of the first six counts and count 11. It is not believed, however, that the guides can be considered adjustable in the sense of that term in counts 8, 9, and 10 or that they have the entrance-guides of counts 7, 12, and 13. The witnesses testify to a disclosure of these features, but they were not embodied in the exhibit.

A second card attachment was made by Leganke and was completed and shipped to the office on May 13, 1899. This had the adjustable feature of the guides.

It seems that in May, 1899, Halle's company entered into negotiations with one Toohey to furnish him machines with card attachments to be used in work for the Equitable Life Insurance Company. Toohey saw the card attachment at that time and agreed to purchase a number of the machines. The first machine was delivered to him on July 8, 1899, and the others shortly afterward. Those machines embodied all features of the first thirteen counts and also the tripping device for turning the cards of count 16. The attachment with the tripping device is said to have been first

constructed in May or June, 1899. These devices delivered to Toohey were provided with the specific U-shaped guiding-groove shown in the applications in this case.

Slaughter alleges conception in December, 1897, and produces many witnesses to corroborate him. His disclosure at that time, however, seems to have been of the most general outlines of the invention merely and not of its details. The substance of it was that he would have two guiding-rods on the platen for the cards, and he illustrated his idea by two pencils placed parallel. He did not disclose the specific form of the guiding-groove, and if that is essential, as held by the Examiners-in-Chief, his disclosure did not embody the invention in issue. After his alleged disclosure Slaughter entered the employ of Halle's company and during that employment and for a period of about one year seems to have said and done nothing about his invention. He claims to have disclosed another form of card-holder to Halle's company, but did not mention the present form, although he claims to have been very anxious to induce the Elliott & Hatch Company to make that form when he was employed by it in December, 1897. His explanation why he did not attempt to induce Halle's company to make the device is not satisfactory, and his silence is not consistent with the theory that he had in mind a clear conception of a practical device which he regarded as of value, as claimed by him. He seems to have had a conception of the general principle of the invention in December, 1897; but there is no evidence that he did anything practical with the invention until he returned to the employ of Elliott & Hatch in the spring of 1899. He does not claim to have conceived the rear receptacle and means for turning the cards until April, 1899.

It is alleged that a card attachment was built by one Hopkins in the experimental room of the Elliott & Hatch Company embodying the invention of Slaughter's present application in May, 1899. Hopkins was the principal workman in that room, and he took one month of his time from other pressing work to make this device. That other work is said to have been so pressing as to necessitate his working on holidays, and there is no explanation why he laid it aside to take up this card device in May, as alleged. The company had no order for the card device at that time and there seems to have been no more reason for taking it up then than at any time previously. There does seem to have been a reason for taking it up later in the same year, for in the latter part of September or first of October the company delivered such a card attachment to the Edison Company in Brooklyn. This was the first order for or sale of one of Slaughter's card attachments. It appears, further, that Slaughter learned of Halle's card attachment in August, 1899.

Slaughter says that the card attachment was made by Hopkins about a month before he sold it to the Edison Company (cross-question 286) and later admits that the delivery to the Edison Company did not take place before September 15, 1899.

The sale of course might have occurred some time before the delivery; but it is not reasonable to suppose that it was long, for Slaughter's device was obtained by the Edison Company to take the place of Halle's card attachment, which they had before obtained. If the sale was effected long before, it is not apparent why the machine was not sooner delivered if it was completed in May, as alleged. Numerous witnesses testify that the Edison machine was the first made or one of the lot of three or four claimed to have been made in May, 1899.

The witness Toohey states that when he went to see Halle's machine in May, 1899, he was looking for a machine to write on cards for the Equitable Company and went to the Elliott & Hatch people in regard to the matter; but they failed to tell him that they had such a machine or contemplated building one. This is not what would be expected of them if they had the machine, as claimed, and is very different from what happened at the interview with the Halle people.

The witness Hopkins states that he made the device in May; but his reasons for believing that it was at that time are not satisfactory. It seems that he and his son and Slaughter after consultation concluded that it was in May, and reached this conclusion because of some remark about working on Decoration Day. It seems probable, however, for the reasons above stated, that he is mistaken and that it was in fact later. There is other evidence besides that mentioned tending to support this conclusion. In regard to the making of Slaughter's device in May the Examiners-in-Chief say:

We confess that the testimony as to this fact is not conclusive.

Upon a consideration of all of the evidence it is believed that the conclusion is warranted that it was not built until later, and there is no satisfactory evidence that it was built until Halle's devices bought by Toohey for use at the Equitable Company's office were completed.

Even if this latest form of Halle's device is the only one which may be considered a reduction to practice of the invention he is as early in date as Slaughter. The earlier forms must, however, be held to be a reduction to practice of so much of the invention as they embodied. The U-shaped grooves for the cards may be an improvement upon those earlier forms, but those earlier forms seem to have worked practically and successfully, and the fact that they were capable of improvement does not show that they did not constitute a reduction to practice. (*Hein v. Buhoup*, 81 O. G., 2068.) The Halle people seem to have been satisfied from the tests of those devices that the invention was practical, for they solicited an order for them from

[Vol. 99.]

Toohey and agreed to furnish a number of machines with the attachment. Toohey also seems to have been satisfied with the practicability of those devices or he would not have ordered those machines equipped with the attachment. This is evidence of a practical and satisfactory sort that the practicability of the invention was established. There is as much evidence that Halle's devices were successful when made as that Slaughter's first device was successful.

It must be held that Halle was the first to conceive and the first to reduce to practice the first thirteen counts of the issue.

The Examiner of Interferences awarded priority to Slaughter on count 16, including the means for tripping or turning the cards, on the ground that he was the first to reduce to practice and that Halle, although first to conceive, was not diligent in reducing to practice. This decision is based upon the assumption that Slaughter's machine was made in May, 1899, and that it embodied the tripping device when first made. It is by no means certain that the device was made at that time or that it then embodied a successful tripping device. Slaughter does not claim in his testimony to have conceived and disclosed the tripping device until April or May, 1899, whereas Halle had conceived and disclosed in the preceding January. Halle's first tripping device was built in May or June, 1899. This first device was a full-sized operative machine and the testimony shows that it did operate practically. It was not in the best form for commercial use, and those made subsequently were constructed with a plate as the tripper instead of a mere cross-bar, so that the cards could not by any accident pass over the tripper and not be turned. This was effected in the first device by the operator placing a piece of cardboard in place on the tripper-bar. Slaughter's tripper is a mere cross-wire and is somewhat similar to Halle's first tripper. It is not satisfactorily established that Slaughter was the first to make a tripper; but even if he was Halle was the first to conceive and was exercising diligence in regard to it when Slaughter entered the field as to this feature and thereafter until it was successfully put into commercial use. It is believed that it would be a harsh and unjust application of the rule of diligence to hold in view of the evidence in this case that Halle was not exercising diligence in regard to this tripper on and after the date of Slaughter's alleged conception. His conduct is all that could reasonably be expected of an inventor under the circumstances.

The decision of the Examiners-in-Chief is reversed and priority is awarded to Halle upon all of the counts involved in this appeal.

Disclaimer.

401,916.—George Westinghouse, Jr., and Frank Moore, Pittsburg, Pa. IMPROVEMENT IN ENGINEER'S BRAKE-VALVES. Patent dated April 23, 1899. Disclaimer filed June 19, 1902, by the present assignee, the Westinghouse Air Brake Company.

Enters its disclaimer—
"To so much or such part of claim 7 of said Letters Patent as includes or may be construed to include—
"An engineer's brake valve (otherwise complying with the said claim) which is not provided with a movable abutment, working in a chamber in the valve casing and controlling a discharge valve from the brake-pipe to atmosphere, substantially as described in the specification."

Indexes to Periodicals.

The following journals containing indexes to periodical literature may be found on file in the reading-room of the Scientific Library:

- Electrical World and Engineer*, a weekly digest of electrical articles.
- Engineering Magazine*, a monthly title-index of engineering articles in the English language only.
- Journal of the United States Artillery*, a bimonthly title-index of current artillery literature.
- Railroad Digest*, a monthly synopsis of universal railroad literature.
- School of Mines Quarterly*, a quarterly synoptical index of articles on analytical chemistry and title-index of metallurgical literature.
- Science Abstracts*, physics and electrical engineering. Monthly abstracts of the principal articles on physics published in the American and foreign journals.

APPLICATIONS UNDER EXAMINATION.

Classification Bulletin.

CLASSIFICATION BULLETIN No. 6, containing the revision made during the months of March and April, 1902, is now out. Price, ten cents.

Hearings.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 16, 1902.

Notice is hereby given that there will be no cases placed upon the docket to be heard by either the Commissioner or the Assistant Commissioner during the months of July and August, 1902.

F. I. ALLEN,
Commissioner.

Access to Pending Applications.

Hereafter no person, except the applicant, the assignee whose assignment is of record, or the attorney of record will be permitted to have access to the file of any application, except as provided for under the interference rules, unless written authority from the applicant, assignee, or attorney, identifying the application to be inspected, is filed in the case to become a part of the record thereof, or upon the written order of the Commissioner, which will also become a part of the record of the case.

PATENTS

GRANTED JUNE 24, 1902.

702,908. PROPORTIONATE DISTRIBUTION VALVE SYSTEM FOR PUMPS. ARTHUR AMMERS, Berlin, Germany. Filed Dec. 15, 1901. Serial No. 24,573. (No model.)

Claim.—1. The combination of a force-pump, a plurality of distribution-pipes, back-pressure valves in these pipes, devices for locking these valves in closed position, means for releasing these locking devices, a rotating shaft, and means connected with said shaft to control the releasing of the locking devices.

2. The combination of a force-pump, a plurality of distribution-pipes, back-pressure valves in said pipes, guided rods, springs to lock the valves in closed position, a rotating shaft, arms fixed on the same in angular relation to each other for raising alternately the guided rods, and means connected with the pump-rod for rotating the shaft.

3. The combination of a force-pump, a discharge-pipe, branch distribution-pipes, a single-acting pawl, a ratchet-wheel, a shaft, a rotating in one direction, two or more cams, back-pressure valves, suitable guided rods having yokes surrounding the cams, and spiral springs to press down the rods when released by the cams and thereby effect the prompt closing of the valves.

702,904. BOX AND COVER. THOMAS ABRAHAM, Hopetown, Mass., assignor to the MASON TUBS CO. and HASTINGS COMPANY, New Bedford, Mass. Filed Dec. 21, 1901. Serial No. 24,728. (No model.)

Claim.—1. A box having a plurality of compartments disposed concentrically in a plurality of circular rows, a cover having apertures corresponding in number to the number of rows, and each aperture located over one of the said rows, means for causing each of said apertures to register with any of the compartments in its corresponding row, and means for opening and closing said apertures independently.

2. The combination of a box having a series of compartments open at one end, an apertured cover rotatably mounted upon the box and movable across the open ends of the compartments therein, and a slide adapted to be adjusted to open or close the compartments exposed by the cover.

3. The combination of a box having a series of compartments open at one end, a rotatable, apertured, cover movable across the open ends of the compartments in the box, and a slide arranged between the box and the cover and moving with the latter, said slide being independently adjustable to open and close the apertures in the cover.

4. The combination of a box having a series of compartments arranged in concentric rows, a rotatable cover having a plurality of apertures, each located over one of said rows, and a slide adapted to be adjusted to establish communication between either of the apertures in the cover and the aligned compartment of the box.

5. The combination of a box having a series of compartments arranged in concentric rows, a rotatable cover having a plurality of apertures arranged in the same radial line and corresponding in number and arrangement to the rows of compartments, and a pivotally-mounted slide having a plurality of apertures arranged on different radial lines and corresponding in number to the apertures in the cover, whereby said slide is adapted to place either of the apertures in the cover in communication with the aligned compartment in the box without uncovering the other compartments that are in alignment with apertures in the cover.

6. The combination of a box having a series of compartments arranged in concentric rows, a rotatable cover having a plurality of apertures corresponding in number and arrangement to the rows of compartments, and having an index indicating and distinguishing the contents of compartments in each row from the contents of the other rows in the box, and a pointer carried by the cover and movable thereby over an index on the box indicating the contents of each of the several compartments in each row.

7. The combination of a cylindrical box having a series of longitudinally-extending compartments open at one end, and arranged in concentric rows, a cover rotatable across the open ends of said compartments and having a plurality of apertures corresponding in number and arrangement to the rows of compartments in the box, and an index adjacent said apertures, a pointer movable with the cover into alignment with the division of an index on the body of the box, each corresponding to a radial line of compartments, and a slide adapted to be adjusted with relation to the index on the cover to open or close either of the apertures in the cover.

702,905. CONVEYER. ALFRED M. AKLIN, Pittsburg, Pa., assignor to Hayl and Patterson, a Partnership of Pennsylvania. Filed Apr. 14, 1902. Serial No. 102,786. (No model.)

Claim.—In conveyers, the combination with a suitable receptacle, of a track arranged parallel therewith, a series of trucks on said track, each of said trucks comprising a body portion having bearings at each end thereof and an axle journaled in said bearings with wheels rigidly secured thereto, a reciprocating bar secured to said track, and a series of swinging flaps carried by said bar.

702,906. FLIGHT FOR CONVEYERS. ALFRED M. AKLIN, Pittsburg, Pa., assignor to Hayl and Patterson, a Partnership of Pennsylvania. Filed Apr. 14, 1902. Serial No. 102,787. (No model.)

Claim.—1. In a conveyor, the combination of a flight-frame having a depending hinge-strip and back of the same depending supporting-legs, of a flight having its upper end extending above the base of the hinge-strip, and a flexible hinge connecting the flight to the hinge-strip.

2. In a conveyor, the combination with a flight-frame having a depending hinge-strip and back of the same depending supporting-legs, of a flight having its upper end extending above the base of the hinge-strip and a flexible hinge secured to the back face of the hinge-strip and to the front face of the flight.

702,907. SUPPORT FOR OVERHEAD CARRIER. TONY ALEXANDER, Newmarket, Miss., assignor of one-half to Gibson Alexander, New Orleans, La. Filed Oct. 7, 1901. Serial No. 72,780. (No model.)

Claim.—1. The improved cable-support comprising a series of vertical posts adapted to be driven into the ground and arranged in line as shown, top cross-bars and lower cross-bars arranged parallel to each other, and means for clamping the cross-bars to the posts as shown and described, whereby they are adapted for vertical adjustment as specified.

2. The improved cable-support comprising a series of posts adapted to be driven into the ground, top cross-bars, lower cross-bars, means for securing them to the posts at any required point, and supplemental anchor-posts connected with the ends of the lower cross-bars and adapted to be driven into the ground, substantially as shown and described.

3. The improved support comprising a series of vertical posts arranged in alignment transversely and made of such length that they are adapted to be driven into the earth, top cross-bars secured to the posts, foundation sills or bars, and oblique ties extending between and connecting the ends of the upper cross-bars and one of the foundation bars or sills, substantially as shown and described.

4. The improved support comprising vertical posts, a top cross member, foundation bars or sills, and ties connecting the ends of the upper member with one of the said sills, and provided with devices for adjusting their tension or length, substantially as shown and described.

5. The improved support comprising one or more vertical posts, cross-bars attached to the upper portion of the same, foundation-sills crossing each other at right angles and secured to the posts, and ties connecting the ends of the upper cross-bars with the ends of the sills which is at right angles to said cross-bars, substantially as shown and described.

6. The improved support comprising a series of vertical posts arranged in transverse alignment, cross-bars attached to and rigidly connecting the upper ends of said posts, foundation-sills attached to the lower

portion of the central post and arranged at right angles to the upper bars, and oblique ties connecting the ends of said cross-bars and sills, the arrangement being such that the ties cross each other in the manner shown and described.

7. The improved support comprising vertical posts, cross-bars attached to the same, diagonal braces applied between the said cross-bars and posts, and clamps which are slidable vertically on said posts and thus adapted to abut the inner ends of the braces in whatever position or adjustment they may be.

8. The improved support comprising one or more vertical posts, cross-bars attached to the upper portion of the same, and clamps embracing both posts and bars and adapted for being tightened or relaxed, as required to provide for attachment, removal, or adjustment of the cross-bars, substantially as shown and described.

9. The improved support comprising vertical posts, cross-bars applied to the upper portion thereof, clamps for securing them to the posts, oblique braces and abutting clamps upon which the braces rest, the arrangement being such that the cross-bars, braces, and both clamps may be adjusted vertically as required, substantially as shown and described.

10. The improved support comprising vertical posts, cross-bars, braces, and clamps secured to the upper portion of the posts, and sills or foundation-bars arranged transversely and also in line with the series of posts at a point removed from the lower end of the latter, and means for securing the said sills in any vertical adjustment, substantially as shown and described.

11. The improved support comprising vertical posts, top cross-bars for supporting a rail or cable, means for securing the bars to the posts in any vertical adjustment, foundation-sills crossing each other at right angles and means for securing them to the posts in any vertical adjustment, substantially as shown and described.

702,908. HOISTING DEVICE. EDWARD F. ATHERTON, Cleveland, Ohio. Filed Mar. 28, 1901. Serial No. 63,908. (No model.)

Claim.—1. In a bucket hoisting and dumping device, the combination with a divided bucket, the parts of which are pivoted together, of a pivot-shaft, arms pivoted together over the bucket and to the upper edges of the bucket, a shaft upon which the arms are pivoted, sheaves upon the two pivot-shafts, and supporting-sheaves upon the peak or traveler above, a hoisting-rope passing over one of the supporting-sheaves, thence over one of the sheaves on the bucket-shaft, thence over one of the sheaves on the pivot-shaft for the arms, thence over the other sheave on the bucket-shaft, and thence to a dead-point on the peak or traveler, and a holding-rope, passing over the other sheave, on the peak, or traveler, thence over the other sheave on the pivot-shaft for the arms and thence to a dead-point on the peak or traveler.

2. In a hoisting and dumping device for a divided bucket, the divisions of which are pivoted to a common shaft, means for raising or lowering the same while transferring it from place to place and for dumping the same, consisting of sheaves upon the pivotal bucket-shaft, arms pivoted to the divisions of the bucket, and to one another at their upper extremities, a pivotal shaft for the arms, sheaves upon the said shaft, and sheaves upon an overhead peak and a holding-line passing over one of the sheaves on the peak and traversing the sheave on the arm-shaft, and both sheaves on the bucket-shaft, finally secured at a dead-point upon the peak, and a holding-line passing over another pulley upon the peak and traversing a pulley on the arm-shaft, and secured to a dead-point on the peak, substantially as described.

702,909. HOISTING DEVICE. EDWARD F. ATHERTON, Cleveland, Ohio. Filed Mar. 28, 1901. Serial No. 63,908. (No model.)

Claim.—1. Means for raising, lowering, dumping and trolleying a divided and pivoted bucket, comprising arms secured to the bucket divisions at the pivotal point, shafts connecting said arms in pairs, sheaves on said shafts, arms pivoted to the outer ends of the bucket divisions and pivoted together in pairs above said bucket, a shaft connecting said pairs of arms, sheaves on said shaft, a bridge and a traveler, sheaves on said traveler, a hoisting-rope passing over one of the sheaves on the traveler, thence over one set of pulleys on the shafts of the rigid arms, thence over one of the pulleys on the shaft of the pivoted arms, thence over another set of pulleys on the rigid-arm shafts, and thence over another sheave in the traveler to a dead-point on the bridge, substantially as described.

2. In combination with a divided or clam bucket, a pair of rigid arms secured to each division, a shaft connecting each pair of arms, a bail for the bucket, comprising pairs of arms pivoted to the back of the bucket divisions, a shaft connecting the outer extremities of each pair of arms, sheaves upon each shaft, sheaves upon an overhead support, a hoisting-rope passing over one of the overhead sheaves, thence over a sheave on one of the rigid arms, and over a sheave on each rigid arm, thence to a sheave on the bail-shaft, thence over a sheave on each rigid arm and thence passing to a dead-point on the overhead support, and a holding-rope passing over one of the overhead sheaves, thence over a sheave on the bail and thence to a dead-point on the overhead support, substantially as described.

702,910. PROPELLING-SPRING FOR TARGET GAMES. WILLIAM R. ADWIN and WILLIAM F. CHAM, Smith Barwick, Conn. Filed Jan. 2, 1902. Serial No. 88,170. (No model.)

Claim.—1. In a target game the combination with a ball and a non-elastic cord attached thereto, of a spring to which the cord is attached and which consists of a piece of spring metal bent backward upon itself

and the ends turned inward to form a support for the operative portion thereof.

2. The spring 12 having a forward bend 16, a backward bend 17 and an end 18 supporting the operative portion of the spring.

702,911. WEEDING-HOE. ORLANDO BARRELLA, South Hartford, N. Y., assignor of one-half to Almond Barrella, Memphis, Tenn. Filed Sept. 30, 1901. Serial No. 77,007. (No model.)

Claim.—A weeding-hoe comprising a cutting-blade having a straight portion A' and vertical members A' A' at the ends thereof, the vertical member at one end being connected by abrupt angles and the vertical member at the other end curved as shown, the parts A' A' being sharpened at both edges, arms projecting inward from the upper ends of the vertical members, and a handle to which the arms are connected, as herein shown and described.

702,912. MEANS FOR DUMPING OR DISCHARGING MATERIALS FROM BUCKETS. HERBERT A. K. BARRY, Westminster, England. Filed Oct. 29, 1900. Serial No. 34,844. (No model.)

Claim.—1. In apparatus for transporting and discharging materials, a dumping-block wherein a plunger passing through the Shank of the hook operates a trigger-lever carried by the handle of the bucket to release the latter, substantially as herein described.

2. In apparatus for transporting and discharging materials, dumping mechanism comprising a pulley in the return-block and a lead cable being connected together and adapted to move vertically in relation to the block-casing, a plunger in mechanical connection with said casing, a tension-rope, a spring-actuated drum for receiving said rope, a cam or star wheel, a pawl carried by a bar pivoted on one of the carriage-wheel axles and to which the lead-rope is connected, a toothed wheel, on the other carriage-wheel axle and a pawl and a lever adapted to be operated by said toothed wheel, substantially as herein described.

3. In apparatus for transporting and discharging materials, a return-block having slotted side plates which carry the pulley pertaining to the lead-rope and the hook which supports the bucket, and a rope held in tension and adapted to support the block-casing, substantially as and for the purpose specified.

4. In apparatus for transporting and discharging materials, the combination, with the lead-rope A, of the pulley a, slotted plates B, carriage C, bar d, pawl e, cam or star wheel f, spring g, drum g', tension-rope h, toothed wheel i, pawl k, lever l, connecting-bar m, lever n', cross-head p and plunger p', arranged and operating substantially as and for the purpose set forth.

5. In apparatus for transporting and discharging materials, the com-

bination, with a plunger operated by the return-block casing, of a trigger-lever *g*, catch *e* and a handle *r* having slots *r'* for the bucket-transmission *d*, substantially as and for the purposes set forth.

702,913. INDICATOR. JACOB S. BAUMER, Burlington, Iowa. Filed Sept. 12, 1901. Serial No. 75,677. (No model.)

Claim.—1. An indicator comprising a frame having means for carrying and displaying a tabulated form, a plurality of independently-adjustable endwise-movable pointers carried by the side of the frame and capable of being projected inwardly to cooperate with the respective items of the tabulated form, and means for automatically returning the pointers to their original position.

2. An indicator, having an endwise-adjustable pointer which is provided with a spring locking-finger, and means which is shiftable transversely of the pointer for engagement by the spring-finger to lock the pointer in adjusted position.

3. An indicator having a plurality of independently-adjustable pointers each of which is provided with a spring locking-finger, and a trip-rod common to all of the pointers and constructed to simultaneously release the spring-tongues thereof.

4. An indicator, having a plurality of independently-adjustable pointers which are provided with spring locking-tongues, and an endwise-shiftable notched trip-rod for locking and simultaneously releasing the spring-tongues.

5. An indicator, having a plurality of independently-adjustable pointers which are provided with spring locking-tongues, and an endwise-shiftable rod working transversely of the pointers and provided with inclined notches in one edge and corresponding to the respective spring-tongues for locking and releasing the same.

6. An indicator, having a plurality of independently-adjustable endwise-movable pointers which are provided with spring locking-tongues, and an endwise-yieldable rod working transversely of the pointers and provided in one edge with notches corresponding to the spring-tongues and inclined downwardly from the outer end of the rod, said outer end of the rod being provided with a finger-piece.

7. An indicator, comprising an open frame having means for carrying within the same and displaying a tabulated form, a plurality of independently-adjustable pointers carried by one side of the frame and capable of being projected inwardly beyond the adjacent inner edge of the frame to cooperate with the respective items of the tabulated form, the outer ends of the pointers being accessible at the outer edge of the frame, and means for simultaneously returning the adjusted pointers to their original position.

8. An indicator, having a plurality of independent endwise-adjustable pointers, each of which is provided with a longitudinal laterally-projected spring locking-tongue, a trip-rod working transversely of the pointers and provided with a plurality of notches, corresponding to and for the reception of the spring-tongues in the adjusted position of the pointers, and coiled springs embracing the respective pointers and bearing in opposite directions against the latter and the trip-rod.

9. An indicator, embodying an open frame having means for carrying and displaying a tabulated form, a plurality of endwise-movable and independently-adjustable pointers mounted transversely within one side of the frame and normally concealed thereby, the outer ends of the pointers being provided with normally-exposed finger-pieces, means for locking the pointers when adjusted and projected inwardly, and a trip device working longitudinally within the frame and constructed to simultaneously release the pointers from their adjusted positions, the trip device having one end yieldably projected beyond the frame and provided with a finger-piece.

10. An indicator, consisting of a skeleton frame having front and back spaced members, a plurality of endwise-movable and independently-

adjustable pointers mounted between the front and back members and normally housed between the same, the outer ends of the pointers having finger-pieces which are normally projected beyond the frame, each pointer having a longitudinal spring locking-finger which is inclined laterally outward and toward the outer end of the pointer, an endwise-shiftable trip-rod working transversely of the pointers and provided in its inner edge with longitudinal notches corresponding to the spring-fingers and inclined downwardly from the outer end of the rod, a spring to normally project said outer end of the rod, and coiled springs embracing the respective pointers and bearing in opposite directions against the spring-fingers thereof and the adjacent edge of the trip-rod.

11. An indicator, having a plurality of adjustable pointers which are provided with spring locking-fingers, and means which is shiftable into and out of engagement with the spring-fingers to simultaneously lock and release the pointers.

12. An indicator comprising a frame having means for carrying and displaying a tabulated form, a plurality of independently-adjustable endwise-movable pointers carried by the side of the frame and capable of being projected inwardly to cooperate with the respective items of the tabulated form, means for locking the pointers in their adjusted positions, and means for automatically returning the pointers to their original positions.

702,914. SCAFFOLD. JAMES BOARDMAN, Philadelphia, Pa., assignor to Boardman Manufacturing Company, Wilmington, Del. Filed Aug. 12, 1901. Serial No. 75,505. (No model.)

Claim.—1. The combination with a base having counterweight slots therein; of a hooked bracket at one end thereof, an angle-iron slidably mounted in each counterweight, a cross-strip connecting said iron, means for locking the strip and iron in adjusted position, a toothed face to each angle-iron, having a slot therein, a second angle-iron for each of the first-mentioned iron, teeth thereon, a foot thereon, means extending into the slot of the angle-iron for locking the teeth and angle-iron in adjusted position, and a spring interposed between the iron of each pair for automatically separating the same when released by the securing means.

2. The combination with a slotted base; of a hooked supporting-bracket at one end thereof, a transversely-extending strip adjustably secured to the base, angle-irons secured to the strip, guide-bells extending from said iron into slots in the base, a second angle-iron adjustably secured to each of the iron of the strip, and a transverse strip connecting said second angle-iron.

3. The combination with a slotted base; of angular supporting-brackets at one end thereof, a transversely-extending strip adjustably secured to the base, a toothed angle-iron at each end thereof, guide-bells extending from said iron into slots in the base, a second toothed angle-iron adjustably secured to each iron of the strip, feet to said second angle-irons adapted to bear upon a window ledge, a cross-strip connecting the feet.

702,915. APPARATUS FOR COOLING OR HEATING BEVER. AGES, CARL DÜCKER, Altona-Ottensen, Germany. Filed May 12, 1901. Serial No. 60,051. (No model.)

Claim.—In an apparatus for the purpose described, the combination of a tank having its side walls formed of non-heat-conducting material, a flue or tube extending from an aperture in the bottom of the tank to points above the upper edge of the tank, a conduit for the fluid to be treated arranged in the form of a coil about said flue and having its ends extending through the walls of the tank, a perforated partition arranged within the tank below said coil, a waste-pipe communicating with the tank, below

said partition, and a removable cover closing the upper end of the tank about said flue.

702,916. SAFETY-PIN. GEORGE BOON, Watertown, Conn., assignor to the Oakville Company, Watertown, Conn., a Corporation of Connecticut. Filed May 12, 1902. Serial No. 18,125. (No model.)

Claim.—1. A safety-pin provided with a shield having a rigid catch for the pointed leg of the pin, and a passage to said catch through the top of said shield.

2. A safety-pin provided with a shield having a rigid catch for the pointed leg of the pin, a passage thence through the top of said shield, a yielding plate forming one side of said passage and arranged to force the pointed leg into the catch.

3. A safety-pin provided with a shield having a rigid side provided with a laterally-projecting lip to engage the pointed leg of the pin, and a yielding plate at one side of the lip for directing the pointed leg into engagement with the lip.

4. A safety-pin provided with a shield having a laterally-projecting lip, a yielding plate at one side of said lip, and a guard for said plate.

5. A safety-pin provided with a shield having a rigid side; a lip projecting laterally therefrom, a yielding side having a flaring outer edge, and a guard extending from the rigid side around outside the yielding side.

6. A safety-pin provided with a shield having a lip arranged to overlap the end of the pointed leg and hold it in closed position, and a wall disposed opposite to said overlapping lip, and a pointed leg having an enlarged part which will not pass between said lip and oppositely-disposed wall.

7. A safety-pin provided with a shield having a laterally-projecting lip, a yielding side, a guard, the edge of which is in the plane of the lip, and a pointed leg provided with an enlarged part which will not pass between the lip and the edge of said guard.

702,917. SAFETY-PIN. GEORGE BOON, Watertown, Conn., assignor to the Oakville Company, Watertown, Conn., a Corporation of Connecticut. Filed July 29, 1902. Serial No. 24,257. (No model.)

Claim.—A safety-pin comprising a wire bent to form the legs of the pin, a metal shield secured to one leg of the pin and having indentations adjacent to its end, and means on the pointed leg of the pin arranged to engage the inner ends of said indentations when the pin is closed.

702,918. COIN-CONTROLLED VENDING APPARATUS. DORY BUCKER, Hamilton, Ohio. Filed Feb. 10, 1902. Serial No. 22,425. (No model.)

Claim.—1. The combination with a rotative shaft, and a cylindrical dispenser mounted thereon, of a cam-wheel formed with a peripheral notch that upon said shaft, a block with inclined upper face, a lever pivoted between its ends and disposed between said block and cam-wheel, a spring beneath the end of the lever nearest said block, the other end of said lever being provided with a downwardly-projecting leg and a catch, substantially as and for the purpose specified.

2. The combination with a rotative shaft, a cam-wheel secured thereon and formed with a peripheral notch and shoulder adjacent thereto, a cylindrical dispenser mounted on said shaft, a block with inclined upper

face, a lever interposed between said block and cam-wheel and having downwardly-depending leg and catch, a ratchet on the shaft of the cam-wheel and a pawl carried by the lever to engage the ratchet.

3. The combination of a rotative shaft, a cam-wheel secured thereon and formed with a peripheral notch and shoulder adjacent thereto, a cylindrical dispenser mounted on said shaft, a block with inclined upper face, a lever interposed between said block and cam-wheel and having downwardly-depending leg and catch, a ratchet on the shaft of the cam-wheel and a pawl carried by the lever to engage the ratchet, said pawl being pivotally mounted on the fulcrum of the lever.

4. The combination with a rotative shaft, a cam-wheel secured thereon and formed with a notch and a shoulder, of a coin-actuated lever formed with a leg and with a catch adjacent thereto whereby the rotation of the shaft is limited by the automatic engagement of the catch with the shoulder or of the leg with either the notch or the shoulder.

702,919. PIPE CUTTER AND WRENCH. ADAM R. BOTS AND GEORGE YARENSKY, Shenandoah, Pa. Filed Feb. 3, 1902. Serial No. 22,426. (No model.)

Claim.—1. In a device of the class described, a body terminating in a fixed jaw, a removable serrated plate coated at its inner end in a resin in the body and having an upturned outer end secured to the outer end of the jaw, and a movable jaw having flanges flanking the body.

2. A convertible pipe cutter and wrench consisting of a body, an upper jaw, a cutter-wheel in said jaw having axle movable in curved slots to adjust the wheel into idle and cutting positions, and means for maintaining the adjustments.

3. A convertible pipe cutter and wrench consisting of a body, an upper jaw having an opening and flanking curved slots, offsets in the slots near the lower end thereof, a wheel in said opening, a headed axle for the wheel passed through the slots, and a nut on the threaded end of the axle whereby the wheel may be adjusted and maintained in idle and cutting positions.

702,920. LEVER FOR LIFTING-JACK. WILLIAM E. DUNNELL, Kalamazoo, Mich., assignor to the Kalamazoo Railway Supply Company, Kalamazoo, Mich. Filed Nov. 12, 1901. Serial No. 55,722. (No model.)

Claim.—1. The combination of a lever; pawls thereon with journals projecting to each side; and bushings to drive into suitable circular seats in the sides of the lever of more than a half-circle in extent.

2. The combination of a lever; a pawl resting in a suitable seat and having journals at each side; and bushings adapted to engage the said journals and be retained in seats in the sides of the lever of more than a half-circle in extent, for the purpose specified.

702,921. GUANO-DISTRIBUTER. JAMES S. BYER, DUNN, N. C. Filed Mar. 6, 1902. Serial No. 94,941. (No model.)

Claim.—In combination with the frame of a plow having handles, of a cross-piece T, a platform, a box mounted thereon, a shoe hinged to said box, stirrers on the shoe extending into the box, a wheel with a series of pins projecting laterally from one face thereof, a rod having a V-shaped end riding on said pins, a bar B pivoted to said platform and to the box, with its free end normally resting on the brace T, as set forth.

702,922. LAUNDRY-STOVE. ELIZA CLARK, Cleveland, Ohio. Filed May 22, 1901. Serial No. 61,322. (No model.)

Claim.—1. In a laundry-stove, the combination of a casing of less diameter at its lower portion than at its upper portion, a grate and ash-receptacle in said lower portion, a kettle in said upper portion spaced from the sides thereof, said kettle being provided with passages extending through its lower portion and affording communication between the combustion-chamber and the space about the sides of the kettle.

2. In a laundry-stove, the combination of a casing of less diameter at its lower portion than at its upper portion, a grate and ash-receptacle in said lower portion, a kettle in said upper portion spaced from the sides thereof and provided with a central flue having a closed upper extremity but open at the lower extremity, the said kettle being also provided with passages affording communication between the central flue and the space about the kettle, substantially as described.

3. In a laundry-stove, the combination of a casing of less diameter at its lower portion than at its upper portion, a kettle in the said upper portion spaced from the sides thereof, the said kettle being provided with passages extending through its lower portion and affording communication

tion for the products of combustion between the space about the sides of the kettle and the space below the kettle, and a grate removably placed underneath the kettle, substantially as described.

4. In a laundry-stove, in combination, a casing, a kettle therein spaced from the sides thereof and provided with passages extending through its lower portion, and affording communication between the space about the kettle and the space below the kettle, a grate and ash-receptacle beneath the kettle, a perforated cap over the inside of the bottom of the kettle, a tube rising centrally therefrom and communicating below with the interior of the cap and an upper section of said tube telescoping therewith and extending above the fluid-level in the kettle, substantially as set forth.

5. In a laundry-stove, in combination, a casing of less diameter at its lower portion than at its upper portion, a kettle in the upper portion spaced therefrom, and provided with passages leading through the bottom to the space about the sides of the kettle, a grate underneath the kettle, a perforated cap within the kettle resting upon the bottom, a tube centrally communicating therewith, and provided with an extensible upper portion, the said upper portion being perforated at the top and provided with a laterally-extending cap over the perforations, substantially as described.

702,923. ROOF-GUARD. SAMUEL P. CLARK, Hartford, Conn. Filed Jan. 22, 1902. Serial No. 91,703. (No model.)

Claim.—1. A wrought-metal roof-guard blanked from sheet metal and bent to shape, said device comprising a double riser, flange extending laterally on each side of said riser, said flange having projections which overlap one another, substantially as described and for the purpose set forth.

2. A wrought-metal snow-guard comprising the base made up of two flanges which overlap one another at one end, and the riser made up of a double thickness of metal connecting the two base-flanges, said riser having incorporated in its outer edge a stiffening-wire, and holes through said riser inclosed by the stiffening-wire, all substantially as described and for the purpose set forth.

702,924. APPARATUS FOR THAWING FROZEN GROUND. GEORGE R. CLARK, Dawson, Canada. Filed Apr. 4, 1901. Serial No. 54,329. (No model.)

Claim.—1. An apparatus for thawing frozen ground, comprising a furnace, a water-compartment into which pass the products of combustion

from said furnace, an exhauster of said water-compartment, for removing the products of combustion from the water-compartment after their passage through the water, means for drawing the water from said water-compartment and discharging it upon the frozen ground in the drift, and a pipe leading from the drift to the furnace, for supplying the latter with heated air, as set forth.

2. An apparatus for thawing frozen ground, comprising a furnace, a water-compartment into which pass the products of combustion from said furnace, an exhauster for said water-compartment, for removing the products of combustion from said water-compartment after their passage through the water, means for drawing the water from said water-compartment and discharging it upon the frozen ground in the drift, a pipe leading from the drift to the furnace, for supplying the latter with heated air, and means for supplying said water-compartment with water, the point of supply of the water to the compartment and the point of drawing off the water from the compartment being above the connection between the furnace and the water-compartment, as set forth.

3. An apparatus for thawing frozen ground, comprising a furnace, a water-compartment into which pass the products of combustion from said furnace, a suction device for drawing the products of combustion from the water-compartment, a pipe leading from the water-compartment and discharging it through said pipe upon the frozen ground, and means for returning the water from the place of discharge to the said water-compartment, as set forth.

4. An apparatus for thawing frozen ground, comprising a furnace, a water-compartment connected therewith and into which pass the products of combustion from said furnace to heat the water, a suction-pump for drawing the products of combustion from the water-compartment, means for drawing the water from the water-compartment and discharging it upon the frozen ground, means for supplying the furnace with air heated by the discharged hot water, and a pump for supplying said water-compartment with water, as set forth.

702,925. TAB FOR SLENDER CONNECTION TO GARMENTS. CHARLES A. COOK, Troy, N. Y., assignor, by direct and various assignments, to Cook Brothers, Troy, N. Y., a Firm, and R. L. McDonald & Co., St. Joseph, Mo. Filed Aug. 1, 1901. Serial No. 70,493. (No model.)

Claim.—1. A flexible link or tab for the purpose specified having attaching means at the opposite ends thereof and provided intermediately of the ends with means for detachable and positive connection with a garment; substantially as specified.

2. A link or tab for the purpose specified formed of flexible material having attaching means at opposite ends thereof and provided intermediately of the ends at an edge thereof with means for detachable and positive connection with a garment; substantially as specified.

3. A link or tab for the purpose specified formed of flexible material having a button at one end and a buttonhole at the opposite end, and provided intermediately of the ends with catches extending inward from the edges thereof for detachable connection with a garment; substantially as specified.

4. Means for attaching suspenders to trousers through a slit in a shirt-waist, consisting of a tab of flexible material having attaching devices at each end, and notches in one or both edges forming a neck and shoulders adjacent to said neck.

5. Means for connecting suspenders with trousers through a slit in a shirt-waist, consisting of a tab of flexible material having a button at one end, a buttonhole at the other, and notches in each edge forming shoulders to engage with said slit.

702,926. AUTOMATIC FLUID-PRESSURE BRAKE APPARATUS. HUBERT CUSHINGTON, New York, N. Y. Filed Oct. 24, 1901. Serial No. 90,008. (No model.)

Claim.—1. In an automatic fluid-pressure brake system, as a means for assisting in the release of the brakes, a passage or cavity, an exhaust-port and a valve moved through a reduction of train-pipe pressure into position for venting the pressure in said passage and moved through an increase of train-pipe pressure to disconnect said passage and exhaust-port.

2. In an automatic fluid-pressure brake system, as a means for assisting in the release of the brakes, a passage or cavity, an exhaust-port and a triple valve moved through a reduction of train-pipe pressure into position for venting the pressure in the passage through the exhaust-port and moved through an increase of train-pipe pressure to disconnect said passage and exhaust-port.

3. In an automatic fluid-pressure brake system, as a means for assisting in the release of the brakes, the combination of a release-passage from a brake-cylinder, a cavity and a reprocessing valve for controlling said passage and cavity, which is moved through a reduction of train-pipe pressure into position for closing the release-passage and venting the pressure from said cavity, and through an increase of train-pipe pressure to open the release-passage and close said cavity.

4. In an automatic fluid-pressure brake system, as a means for assisting in the release of the brakes, the combination of a release-passage from a brake-cylinder, a cavity normally containing fluid-pressure, and a triple valve shifted in one direction for admitting pressure to the brake-cylinder and releasing pressure from said cavity and shifted in the other direction for releasing pressure from the brake-cylinder and admitting pressure to said cavity.

5. In an automatic fluid-pressure brake system, the combination of a primary piston, a secondary valve device actuated through an increase of fluid-pressure, independently of the movement of the primary piston, for controlling the movement of the primary piston, a passage for causing variation of pressure on the primary piston, a release-passage from a brake-cylinder and a valve operated by the primary piston for controlling both of said passages.

6. In an automatic fluid-pressure brake system, the combination of a primary piston for controlling by its movement the release of pressure from a brake-cylinder, a secondary valve device actuated by an increase of fluid-pressure, independently of the movement of the primary piston, a passage controlled by said secondary valve device for causing variation of pressure on said primary piston, and a valve operated by reduction of train-pipe pressure to vent the pressure from said passage and moved by the primary piston to close the same.

7. In an automatic fluid-pressure brake system, the combination, with the main valve of a triple valve controlling a release-passage from a brake-cylinder, of a primary piston for controlling the movement of said valve to release position, a secondary valve device actuated through an increase of fluid-pressure, independently of the movement of said primary piston, a passage controlled by said secondary valve device for varying the pressure on the primary piston which is alternately opened and closed by said main valve while the said release-passage is alternately closed and opened.

8. In an automatic fluid-pressure brake system, as a means for insuring the release of the brakes, the combination of a valve for controlling by its operation the ultimate movement of the triple valve to release position, a piston or diaphragm actuated by an increase of fluid-pressure for controlling said valve and means for controlling said piston and limiting its operation to a predetermined, definite pressure per square inch.

9. In an automatic fluid-pressure brake system, the combination, with a train-pipe and a triple valve, of a valve device on the car, which is actuated by a predetermined definite pressure per square inch, for controlling by its operation the ultimate movement of the triple valve to release position, a second valve device on the locomotive for controlling the admission of pressure to the train-pipe and means for regulating the use

and valve device, whereby in one adjustment thereof the pressure admitted to the train-pipe will be insufficient, and in another adjustment thereof said pressure will be sufficient, to operate the first-mentioned valve device to move the triple valve to release.

10. In an automatic fluid-pressure brake system, the combination of a valve controlling a release-passage from a brake-cylinder, a primary piston controlling said valve, a passage for venting the pressure from one side of said primary piston, a secondary piston for controlling by its operation said passage and a valve device operated by an increase of fluid-pressure, independently of the movement of said primary piston, for controlling the operation of said secondary piston.

11. In an automatic fluid-pressure brake system, the combination of a valve controlling a release-passage from a brake-cylinder, a primary piston for controlling said valve, passages for supplying pressure to and venting it from one side of said primary piston, valves controlling said passages, a secondary piston for controlling the last-mentioned valves and a valve device actuated by an increase of fluid-pressure, independently of the movement of said primary piston, for controlling the movement of said secondary piston.

12. In an automatic fluid-pressure brake system, the combination of a release-passage from a brake-cylinder, a passage or cavity normally containing fluid under pressure, an exhaust-port, a valve moved through a reduction of train-pipe pressure for closing said release-passage and controlling said cavity, a secondary valve and a passage for alternately closing and opening said cavity to said exhaust-port which is controlled by both the primary and secondary valves.

13. In an automatic fluid-pressure brake system, the combination in a triple-valve device of a piston, a main valve, and a secondary valve, both operated by said piston, a passage or cavity normally containing fluid under pressure, a passage for alternately opening and closing said cavity to exhaust and ports controlled by said primary and secondary valves, whereby said cavity is opened to exhaust through said two valves moving in opposite directions and is closed through said valves moving in the same direction.

14. In an automatic fluid-pressure brake system, the combination with a triple valve of three passages leading from a common source, first to the auxiliary reservoir, second to the triple-valve chamber, and third to exhaust, and a valve device actuated by a variation of fluid-pressure for placing the second of these passages alternately in communication with the first and the third.

15. In an automatic fluid-pressure brake system, the combination with a triple valve, of a recharging-passage for charging air from train-pipe to the auxiliary reservoir while the triple valve is in position for setting brakes, three passages leading from a common source first, to the reservoir, second to the triple-valve chamber, and, third, to exhaust, and a supplemental valve device actuated through an increase of fluid-pressure for closing the second of these passages to the first and opening it to the third.

16. In an automatic fluid-pressure brake system, the combination of a primary piston, a secondary valve device actuated through an increase of fluid-pressure, independently of the movement of the primary piston, for controlling the movement of the primary piston, a passage for causing variation of pressure on the primary piston, a release-passage from a brake-cylinder and a valve operated by the primary piston for controlling both of said passages, together with a passage for recharging the auxiliary reservoir of the system from the train-pipe while said valve remains in position to close said release-passage.

17. In an automatic fluid-pressure brake system, the combination, with the main valve of a triple valve controlling a release-passage from a brake-cylinder, of a primary piston for controlling the movement of said valve to release position, a secondary valve device actuated through an increase of fluid-pressure, independently of the movement of said primary piston, a passage controlled by said secondary valve device for varying the pressure on the primary piston which is alternately opened and closed by said main valve while the said release-passage is alternately closed and opened, together with a passage for recharging the auxiliary reservoir of the system from the train-pipe while the triple valve remains in position to close said release-passage.

702,927. RYAN-BALANCE COMPUTING-SCALE. JOHN W. CULLEN, Cleveland, Ohio, assignor to the National Computing Scale Company, Cleveland, Ohio, a Corporation of Ohio. Filed June 26, 1902. Serial No. 21,590. (No model.)

Claim.—1. In a spring-balance, the combination of an external case capable of being supported and having in its bottom guides for the runner, weighing-springs suspended by their upper ends within the case and from rigid parts thereof, a vertically-movable runner secured on the lower ends of said springs, and movable in the guides in the lower part of the case, with a chart-drum rotatably mounted on a vertical axis within said

case and having external horizontal rows of value-indicating figures extending at different rates, said external case being apertured whereby portions of said value-indicating rows may be seen, and corresponding weight-indicating figures adjacent to said apertures and in the same plane with the corresponding value-indicating rows of figures, and mechanism for translating the vertical movements of the runner into rotary movements of the chart-drum, substantially as specified.

2. In a spring-balance, the combination of a case consisting of a drum and top and bottom end plates, means attached to the top plate for suspending said case, spring-supports within the case rigid with the bottom plate thereof, a runner movable vertically through said bottom plate, and weighing-springs which are connected at their upper ends with said spring-supports and at their lower ends with the runner, with a chart-drum which lies between said spring-supports and the vertical walls of the case which drum is mounted upon its vertical axis in said case, said chart-drum having its external surface divided into horizontal rows which are graduated and marked with computed values, said case-drum being apertured whereby said horizontal rows of graduations may be seen, value-indicating figures adjacent to the value-indicating rows of the chart-drum, and mechanism for translating the vertical movements of the runner into rotary movements of the chart-drum, substantially as described.
